We wish to make it clear that we are not condemning *all* Caucasians. There may be strains of them that do not show up the bad traits that we have found in ours. Our Caucasians as stated consist of two different strains—some of one and some of another; and we find that the crosses of Caucasians—that is, bees from Caucasian queens fertilized by an Italian drone—show the bad traits about as strongly as the pure bloods of the dark race, with the difference that the Caucasian-Italian is a little more vindictive than either of the pure races.

CONVERSATIONS WITH DOOLITTLE

WORKING WITH VICIOUS BEES.

A correspondent writes, asking that I tell the readers of *GLEANINGS* how I master "awfully cross bees." I take it that he has bees which need more than the usual means to subdue them. Where I find a colony (as I do sometimes when others wish me to do some work with certain colonies in their apiaries) that will not yield to a few puffs of smoke blown in at the entrance, and then a little smoke blown over the tops of the frames when opening the hive, I always treat such "awfully" cross colonies as follows:

With the smoker burning nicely, and full of fuel, I step to the entrance of the hive and send into it a few puffs of smoke, blowing as strongly as possible so that the smoke may reach all through the hive as nearly as may be, when the entrance is closed, and the hive strongly jarred by being pounded with the doubled-up fist or a stick of wood. But the doubled-up fist is better, as one will not be likely to pound it hard enough to break down any combs, which may happen when striking with a heavy stick. This jarring, together with the smoke, causes the bees to fill themselves with honey, which can be hastened by opening the entrance in about a minute, puffing in more smoke, and then shutting and pounding again. If many bees from the fields have collected at the entrance it is better to let them run in before smoking the second time, as they will add to the hubbub by being greeted with smoke immediately after entering. In about three minutes from the time of starting, one can open up the worst colony of bees ever seen, when thus treated, without any of the bees offering to sting. But if the bees are of the black or hybrid variety they will run all over, out of the hive, down under the bottom-board, or almost anywhere instead of staying on their combs. For this reason, when treating black or hybrid bees I generally take some old box or cap to a hive, or in absence of these an empty hive, and set this on top of the colony to be treated, after first having removed the cover from over the frames to the colony, using smoke while doing so, and the smoking and pounding will cause the bees, after filling up with honey, to run up into the hive or box provided, in which place they are out of the way, and there is no danger of losing the queen. In this way bees will remain quiet for the time desired, after which they may be shaken down in front of their home, into which they will run like a swarm. Even the worst Cyprians I ever saw can be mastered in this way; but it needs about five minutes to put these into a thoroughly submissive state.

Now having told how the thing is done I wish to say that it is rare that as harsh treatment as this has to be resorted to, for 499 colonies out of 500 will allow of being handled without showing unreasonable temper with a few puffs of smoke at the entrance and a little over the tops of the frames when the hive is first opened. Yes, further, with 99 out of every 100 of my own colonies which I handle, I never think of blowing any smoke in at the entrance—simply raise the cover-

ing over the frames as quietly as possible; and as the cover rises gently, draw the bellows of the smoker together so that a little smoke may float over the tops of the frames, when I do what I wish with the bees without further smoking. Many colonies can be handled without any smoke whatever; but without it the bees will be more or less in the way, so I use smoke very lightly, in this way, on every colony opened, even if I know they do not need it to keep them from being angry at the rudeness from the light being suddenly let in upon them. In all operations with the bees the motto should be, "Use as little smoke as possible, but never be stampeded by any colony."

Another correspondent wishes me to tell why his bees are so cross, but gives me no data to go by. The Italian, Carniolan, and Caucasian bees are not cross without cause; but hybrids and Cyprian bees, as well as the Syrians and very many colonies of the blacks, are easily aroused—in fact, ready for "war" on the least provocation. Then if any hive is being robbed, or honey has been left out till robbing of the same has gotten well under way, the whole apiary, during a time of scarcity, may be suddenly turned "from lambs into tigers." The remedy here is very obvious. Tearing off the covers hastily, or bumping the hives while opening, before using any smoke, often exasperates the bees so that ten times the amount of smoke is needed before we can go on with our work which would not have been needed had we worked quietly and given a little smoke gently, just as the cover began to be raised from over the frames. Such a mode of treating the bees is much like the bad parent who gives the word and a blow, generally giving the blow first. Always treat the bees humanely, and give smoke first. Where ants have formed their homes about the top of the hives, so that they are ready to run in among the bees at the first crack being made between the hive and the cover as it is lifted, it often irritates the most peaceable colony, so that a severe smoking has to be given them before they will yield to the apiarist. Remedy—don't open the hive until you have stampeded the ants by killing or otherwise. I do not suppose many have trouble with snakes; but at our out-apiary there are quite a few small snakes—small enough to run in at the entrance of the hives. The bees do not seem to be able to sting the snakes, but they lay hold on them, when the snake will "thrash around," hitting the frames and causing an uproar sufficient to drive every thing away from the apiary for some hours unless the bees are subdued by a vigorous smoking and pounding. When working one day, a snake about fifteen inches long wiggled itself out from the hive with two or three hundred bees hanging to it hissing and trying to sting. I marked where it stopped, and, after subduing the bees (I came near being driven from the yard), I went and killed it; but an examination did not show a single sting about it anywhere. It got off much better than I did (save the killing), for I received forty or fifty stings, although I did the best I could short of running away. Then on cold days, or at times when honey is not coming in from the flowers, the old bees do not like to be disturbed, and occasionally will sting with a vengeance. I have worked at the bees during a pleasant forenoon, when the bees were busy, without

a single cross bee hovering about my head, only to be greeted with hundreds of them hanging to the veil on my hat, and singing that very interesting song they can sing when maddened, four hours later, after an unexpected three hours of rain. All of these things should be taken into consideration, and the bee-keeper be governed accordingly. When, from former experience, you know that the bees are likely to feel ugly, or are easily disturbed, use smoke till you see them "doff their hats;" and at times which point toward good nature a little smoke over the tops of the combs is all that is needed.

Borodino, N. Y.

BEE-KEEPING IN THE SOUTHWEST

BY LOUIS SCHOLL

Texas prospects have turned brighter than was expected a month ago. The mesquite-trees are loaded with bloom this month of June, and the bees are rolling in the honey in the good old-fashioned way—the way so many would like to see their bees do. Yes, and we are sure now that Texas will keep up its record as the leading honey-producing State.

A NEW BULLETIN.

Bulletin No. 102, of the Department of Entomology, Texas Agricultural Experiment Stations, entitled "Texas Honey-plants," has recently been published. It is a preliminary bulletin on the honey-plants of Texas, containing a list of honey and pollen yielding plants so far collected by the writer, with data showing the distribution and the relative importance of each. Both the botanical and common names are given except in a few cases where the latter could not be obtained.

Although this bulletin is of a technical nature and the descriptions are brief, it is hoped that it will be a great help in many respects, especially in that it furnishes the bee-keeper with a list of the Texas honey-plants by which it may be possible to select locations, or it may help in selecting certain plants for planting that might prove of value. All who are interested may address the above department at College Station, Texas.

THOSE BOTTOM-BARS, AGAIN.

Those wide-bottom-bars, Dr. Miller, are, nevertheless, a nuisance here, with most of us, even though they may not be with you, p. 682. Conditions differ in different localities; so do different strains of bees, as is also mentioned by our editor. This latter could be gotten rid of if a vigorous fight were made against all strains that have a tendency toward blocking great chunks of propolis between frames with such narrow spaces as yours. Where propolis is very plentiful, so that all colonies stick glue between the frames, it is quite another question—the propolis can't be so easily gotten rid of without sacrificing the whole locality. Where the locality is good, or even if the above-mentioned strains of bees are good ones, I'd favor narrower bottom-bars. I do not use dummies, first, because I can't use them in

ten-frame hives with a full set of ten frames; and, second, because even in some eight-frame hives I have, the bees glue them in so they are a worse nuisance than the wide bottom-bar frames. Your nail-spacers would soon be transformed into great wads of propolis, and help the bees to fasten even the end-bars to each other. It's better not to have this much of a starting-place for the bees to stick their propolis. Just a plain, narrow, smooth frame, without any obstructions on it—and a narrow bottom-bar, of course—is the frame for me.

"WITH ABUNDANCE OF STORES IN SIGHT."

This question has been harped on for some time without a definite conclusion being arrived at. If the apiarist will go into any average apiary he will find generally that the strongest and best working colonies are those with a lot of stores on hand. The "stores in sight" have something to do with the strength of the colony. It has a stimulating effect upon it; there is no doubt about that. It would be foolish, in my mind, to suppose, however, that simply because the "stores are in sight"—that is, that the bees are able to see the amount of honey they have ahead of them—is the true cause of their progressiveness. An abundance of stores stimulates brood-rearing, not because the bees see their way clear, but because it is drawn upon heavily, which incites the colony. A colony without this abundance of stores generally begins brood-rearing at the same rate as those with their hives full of honey, but soon has to give up the race, and fall behind. It is then they begin to restrict brood-rearing operations within the limitations of the food supply. This, however, is often not done until the entire stores have been used up, and the bees are required to gather the necessary food supply from the fields, while the colonies with an abundance on hand simply draw from this. The latter saves the workers while the former wears them out; and the result is, the fielders become scarcer as the season advances, in proportion to the brood reared. Under such conditions very few bees will be flying from colonies short of stores. In most cases there is an abundance of brood and adult bees, which might have been fielders, and which are retained as nurses. My remedy for such colonies, in the spring, is simply to set a shallow extracting-super, partly filled with honey, from some of the stronger ones, on top of each. This should be done before the above-mentioned condition has been reached, to prevent the setback that it gives all colonies that have been neglected too long. If done early, these colonies will keep pace with the stronger ones that have had an abundance of stores; and, even if it is done later, the colonies will soon recover.

In giving these stores the colonies are stimulated in the first place, and then the adult bees are saved from wearing themselves out in their efforts in obtaining the necessary food supply from outside sources. "One ounce of prevention is worth several pounds of cure" in this matter, and it can be accomplished by simply leaving enough honey in the hives in the fall so that all colonies will be saved the danger of running short in the critical moment when bee-life is worth a great deal in the spring.

This question has come to me: "If there is

such a thing as a colony of bees looking ahead, and taking inventory of the stores in sight, then arranging brood-rearing operations according to the food supply, why is it that so many colonies rear an abundance of brood with so little ahead that they are caught later with the hive full of brood and not a drop of honey?"

THE KINDS OF HONEY PRODUCED IN TEXAS.

Comb honey in sections was one of the main byproducts of the up-to-date bee-keepers, but the great risk of shipping it safely in a hot climate, on account of the frailness of the article, resulted in frequent "smash-ups," and often in melting down when left in the hot sun. Besides, section honey is expensive to produce. To obviate these objections, comb honey is now produced in the regular frames, cut out, and packed in cans, liquid extracted honey being poured over the whole to fill the crevices, so that the combs are kept buoyant in it, and kept from mashing. This kind of honey brings more dollars into the bee-keeper's pockets than section honey. It is easier produced, and more will be made by the bees in the frames. The demand for it is better, also, as the consumer gets more for his money; hence its production has replaced the section honey almost entirely.

Extracted honey is produced on a large scale here, and is still the old standby. More honey can be obtained with the honey-extractor, and the real profits are greater than comb-honey production. The only obstacle in the way heretofore has been the idea generally prevailing that such honey might be adulterated. Since the pure-food laws have been in effect this has been removed to a great extent, and now there is a tendency to resort more and more to producing extracted honey. In time this will largely replace comb-honey production here. Granulation of the honey has been a great drawback toward successfully marketing a crop later in the season when prices were stiffening; and to prevent the trouble of having the comb-honey granulate in the cans, making it unsalable, it was moved off rapidly by many bee-keepers, to their detriment, regarding the market price received. With extracted honey, educating the public how to reliquefy the granulated honey, and that it is the best proof of its purity, is all that is needed. Then such honey can be kept over the winter for better prices if need be.

Texas has its own standard-size packages for honey, both comb and extracted. These are all figured on a basis of 120 pounds to the case, or 60 pounds to a half-case. For extracted honey the regular 60-lb. square five-gallon cans, two in a case, prevail. These have a small opening of 1½ inches, with a screw cap. For comb honey the same size of cans, two in a case, have large eight-inch screw caps to admit the comb honey to be placed in it. Twelve-pound friction-top pails, 10 in a case, making 120 pounds; six-pound friction-top pails, 10 in a case, making 60 pounds, and 3-lb. friction-top cans, 20 in a case, also making 60 pounds, are used for both comb and extracted honey in smaller-sized packages for retailing in the original package. This standard is so well known now that orders are always made in accordance with the price list, which appears as follows:

PRICES OF HONEY.

		COMB	EXTRACTED
60-lb. cans, 2 in a case, per lb.			
12 "	" 10 "	" "	" "
6 "	" 10 "	" "	" "
3 "	" 20 "	" "	" "

TERMS.—Sight draft, bill of lading attached, subject to examination.

The freight rates on honey put up in this way are very low, as it goes at the fourth-class rate, while section comb honey must go in glass shipping-cases properly crated at double first-class freight rate, and at owner's risk; besides, the can packages are much safer.

New Braunfels, Texas.

FANCIES AND FALLACIES

By J. E. CRANE

Liquefying candied comb honey seems to me a very decided step forward in our industry, and of great commercial value. I don't remember where the idea originated, but it seems to me it was not far from Medina.

That editorial, pages 413, 414, as to the value of sugar as a producer of muscular energy, almost takes one's breath away. "One pound of honey equal to five pounds of pork in dietetic value." I don't believe we bee-keepers have half appreciated our calling.

Dr. Miller, page 485, April 15, with a Stray Straw, would seem to knock over Mr. Doolittle's theory of the value of a number of dummies in a hive. But I fancy Mr. Doolittle uses section-frames for surplus instead of a regular-sized clamp or super, so he need not cover the top of a hive any further than combs of brood extend, and four dummies at the side of his brood-chamber will do no harm.

Dr. Miller says (page 411), "I don't know how bees know so much, but I think it is the general understanding that they are far-sighted enough to be more lavish in starting brood in spring with a big lot of honey in sight than with only enough to run them from day to day." That is a good thought, doctor, and I tell you it is hard building up a colony without some honey in the hive. I have had some experience along these lines this spring.

On the same page he says, "James C. White is wisely advised to tier up to prevent swarming. Let me add an item. Shove the second story either back or forward so as to make a ¼-inch crack for ventilation. Do this with each added story. This will double the security against swarming." The editor thinks him probably right, but fears so much ventilation will keep a large portion of the fielders at home to keep up the necessary temperature. Doubtless the weather would make some difference; but it seems to me that, during July and August, quite as many

fielders would be required to ventilate a hive two or three stories with only one entrance at the bottom as to keep up the temperature with more openings for ventilation.

On page 415 we are told that alsike-clover hay is beginning to have a special market value. "For race horses it is considered the best hay obtainable." An extensive dairyman who supplies our village with a large portion of its milk told me not long ago that the best hay he could produce as feed for milk was alsike-clover hay. The county in which I live has done a large business in producing American Merino sheep and shipping them as far as Australia and South Africa, and alsike-clover hay is preferred in transit to any other. Let's push its cultivation.

On page 433, April 1, C. F. Bender tells us some important facts in regard to the breeding of bees. It is especially interesting as showing how much more thought is given to this subject now than formerly. I do not remember that any thing was said or thought upon the improvement of bees, further than to introduce new races or breeds; yet I believe few persons who have handled bees extensively have failed to notice the great variation in different colonies of the same race or breed, often amounting to more than the difference between different breeds, and quite as great as among domestic animals. Experience has proved that bees are quite as responsive to careful breeding as any other stock.

Mr. Doolittle tells us, page 417, that the best results in production of comb honey are secured by having every comb in the brood-chamber full of brood. If not full of brood, take out combs of honey and fill with dummies of wood. Presumably a colony will store honey better over combs of brood than over combs of honey; but why will they store better over a wooden dummy than a comb of honey? I have failed to see any difference in favor of wooden combs or dummies over one of honey. But wouldn't it be better to fill out such hives, as the queen fails to fill with brood, with combs of brood from hives that are preparing to swarm, or that we have taken away to prevent their making such preparation? I prefer this to using wooden dummies.

I want personally to thank Dr. C. C. Miller for his interesting and practical article on the use of wooden splints in place of wiring frames to prevent sagging, page 423, April 1. I believe it the most practical method yet devised to prevent sagging, and propose to put it to the test at once. But really I found it quite a task to saw out those little sticks $\frac{1}{8}$ square. The method described by J. A. Green in GLEANINGS for May 1 seems like a great improvement.

Later I took a stick of black ash, eight inches long, and split it up into pieces one-half or three-fourths inch square, and by vigorous pounding I was able to split it into splints about $\frac{1}{32}$ inch in thickness, which in turn were again cut into very narrow strips. One of these, $\frac{1}{32}$ inch square, I found would hold up over ten pounds. But not

every bee-keeper has a circular saw or black-ash timber. Perhaps the supply houses who furnish foundation can with it furnish splints. Another thing I have been thinking of, I wonder if the stems or stalks of certain grasses would not answer every purpose. Take, for instance, timothy or reedtop, and cut off just below the head, and again eight inches below; soak when dry in wax, and press into the foundation the same as splints.

That statement by R. A. Burnett, page 422, April 1, to the effect that "if bee-keepers would allow their honey to ripen upon their hives it would do more toward creating a demand for it than any law against adulteration," seems like a pretty strong statement. We have bought some honey not perfectly ripened. I believe where such is the case it is through the ignorance of the producer, or perhaps I should say inexperience. We purchased last year from the bee-keepers of Northern and Eastern Michigan many thousands of pounds of extracted honey, and have failed to find a single pound that was not well ripened; but the bee-keepers of Michigan are a splendid lot of men, and seem as much interested in having it well ripened as in producing it.

We have got to look out for that Jay, p. 494, April 15, or he will upset all our previous notions and send us off on new lines before we know it. And now he would have us believe that if we keep 500 colonies in one place where only 50 are now kept there would not be more than two per cent less honey gathered per colony than now. The worst of it is, we can not deny that his guesses are about right during a good flow of honey. But, hold a minute. We do not always have good flows of honey; and when we do not we have to resort to the sugar-barrel and bank account. During a good flow of honey with abundant clover bloom I am satisfied 500 colonies could be kept in one place with satisfactory results; but when there are less flowers in spring and fall we should have to feed very heavily to keep all thriving. Mr. Alexander, who is the best authority in this country on very large apiaries, commences his article on page 504 by saying, "Feeding is becoming a very important part of our business." Just so; and the more the colonies are massed together the more important the feeding become. Where there is a good flow for four or five weeks, nine years out of ten, it will doubtless pay the careful, painstaking apiarist to keep large apiaries; but where other conditions prevail it seems doubtful.

I notice a typographical error in that most excellent review of Bulletin 110 of the United States Department of Agriculture, commencing on page 549. Near the top of page 450, in giving the United States standard for honey it says it "contains not more than 25 per cent of water, not more than 25 per cent of ash." It should have been $\frac{2}{10}$ per cent of ash—quite a difference.

I have been especially interested in the analysis of No. 23. A sample from the same lot of honey was pronounced by the New Hampshire State Board of Health as adulterated, and so published in one of their bulletins. The honey was produced in one of our own yards, and we knew of its

absolute purity. A considerable correspondence followed in which neither party was willing to admit he was in error. But better methods of analysis adopted by Dr. Browne show very conclusively where the trouble came from.

In the next bulletin issued by the New Hampshire Board of Health they state in a note on the last page, "*Concerning the Cane-sugar Content of Honey*," "In the last issue of the Bulletin a sample of honey bottled by J. E. Crane & Son, Middlebury, Vt., was reported as adulterated with cane sugar. It is, perhaps, due the firm to state that the adulteration was technical rather than of a fraudulent character, the quantity of cane sugar found being not greatly in excess of the recognized limit of that constituent.

The maximum content of cane sugar recognized in pure honey by the United States Department of Agriculture is $\frac{1}{100}$, and this standard has also been specifically adopted by the legislatures of several States. When, therefore, this figure is materially exceeded it has been the custom to infer that such is due to the feeding of sucrose to the bees, either with fraudulent intent or carelessly. However, in the case under consideration Messrs. J. E. Crane & Son strenuously urge that they have been duly careful to feed no more than the least possible quantity of sugar required at the period when artificial feeding is necessary; and in view of the business reputation of the firm, and its standing in the industry, it is believed that this claim is conscientiously made."

Thus in a few sentences is saved the face of the New Hampshire Board of Health and the producers of this honey or seeming to. But it seems never to have occurred to them that their methods of analysis might be wrong.

If one gives careful attention to the tables of the United States bulletin referred to, it will be noticed that the samples of clover honey given contained from over $\frac{1}{100}$ per cent to no sucrose. Why this variation? It is caused by differences of soil or climate, or the time that has elapsed between the gathering or storing to the time the analysis was made. In regard to this the New Hampshire Board of Health, in the note above referred to, says: "There would seem to be opportunity for investigation relative to the possible bearing upon the sucrose content of modern methods of ripening and packing honey. As yet the exact nature of the agency causing the inversion of cane sugar in honey does not seem to have been determined; but it is certain that at least up to a certain point this inversion steadily proceeds after packing. The firm alluded to recently adopted the practice of pasteurization of their goods during their packing process. Comparative determinations made by us on several jars of the same output originally submitted to different treatments showed unexpectedly a higher sucrose content in the jars subjected to a temperature of 160 to 175 degrees Fahrenheit. Provided this phenomenon should be demonstrated to be a constant one, the only apparent explanation would be that the inversion is due mainly to a digestive ferment that is destroyed by the pasteurization process. In other words, does heating honey soon after being stored by the bees prevent those chemical changes taking place that would occur if left for a longer time without heating."

Middlebury, Vt.

GLEANINGS FROM OUR FOREIGN EXCHANGES

By W. K. MORRISON

The government of Denmark has voted a sum of money, and has also appointed a commission, to deal with the disease known as the foul brood of bees.

A writer in one of the European bee journals maintains that it is only from the second crop of red clover that bees extract any nectar. Is this so? The present writer imagines that *mammoth* clover produces all the so-called red-clover honey, or at least nearly all.

Monsieur Jacquemart, President of the local bee-keepers' society at Thimister, Belgium, has engaged a solid train for some date in July to convey the bees of the members of the society to the heather bloom. Evidently the presidency of a Belgian bee-keepers' society is no sinecure.

According to *L'Apiculture Nouvelle* the recent prices of foreign honey and beeswax in Hamburg are as follows: California honey, $8\frac{1}{2}$ cts.; Chili, 5; Cuba, $4\frac{1}{2}$; San Domingo, $4\frac{1}{2}$; Mexico, $4\frac{1}{2}$. Beeswax from Benguela, 30 cts.; Brazil, $31\frac{1}{2}$; Chili, $31\frac{1}{2}$; Cuba, 31; Madagascar, 29; Morocco, 30.

A writer in *Le Rucher Belge* states that only two authors, Reaumur and Della Rocca, have stated that the young queen leads the first swarm. On the other hand, Bevan, Quinby, Hamet, Drory, Bastian, Dubini, Dzierzon, Berlepsch, Vignole, Colin, Debeauvoys, De Layens, Cowan, Alley, Cheshire, Girard, Newman, Cook, Rauschenfels, Digges, and Root, affirm it is only the old queens that leave the hive at the head of the swarm. This is by way of reply to a Mr. Keller, who thinks the young queens frequently head the new swarm because he discovered one that did.

Biene und ihre Zucht is responsible for the statement that in Hannover alone 38 special trains are required to transport colonies of bees to the heather moors in autumn. That means 19 train loads of bees each way. This, it should be understood, does not represent American train loads. The cars are small, not more than five tons, and the locomotives are in the same proportion. Probably two American trains would accommodate the whole lot; but still this shows a very commendable and enterprising spirit on the part of German bee-keepers. Other states in Germany do equally well.

I note that the bee-keepers of the Netherlands, Denmark, Norway, Sweden, and Russia are very much inclined to follow the lead of America in bee culture. The bee-keeping journals quote Miller, Alexander, and Doolittle right along, and articles by noted Yankee bee-keepers are freely translated, and presented to their readers. This is the more remarkable because they are situated near Germany, a great bee country; and one would naturally suppose they would borrow

ideas from the Fatherland, but they do not. The Latin nations have already adopted the Langstroth system.

The *Revue Eclectique d'Apiculture* in its April and May issues has a long poem relating to the work of the bee-keeper. The authoress is Adele Vaillant, who evidently wields a facile pen as well as a smoker. This reminds me that we are far behind other nations when it comes to bee poetry. France, England, and Germany are well provided with bee poetry while we have but very little. The English have three classics on the subject by Virgil (translation); Murphy (tr.), and Evans. They also have "Buz a Buz," a translation from the German. The *Revue Eclectique* not long ago published a long bee poem going through a number of issues; and, besides, France is otherwise well provided.

The Algerian bee journal *Nahhla* (the Arabic word for *bee*) has been restarted. It is published by the Algerian Bee-keepers' Society, which is quite a lively affair. Professor Trabut, M. D., in the School of Medicine at Algiers, is honorary president, and other prominent public officials hold the various positions in the society. It gets a grant of money from the government, and in other ways has its co-operation. The chief object is to substitute the modern system of bee-keeping for that pursued by the Arabs and Kabyles. Algeria is naturally a fine bee country, resembling California, or, rather, Arizona. Bee-keeping there is more reliable than it is in California, however, as the apiarists seem to do pretty well every year.

European bee-keepers set much store by the locust-tree for bees. They term it *acacia*, which is a better name, but it is the same old black or yellow locust of the Northern States. Though strictly an American tree it is more highly valued in European countries than in its own land. The tree-planters of the old countries have planted great quantities of it until it is much more common there than it is in Ohio. A recent writer in *Le Rucher Belge* compares basswood and locust to the advantage of the latter, and it seems to me he is right. Most people would prefer locust to basswood honey, and it is a more reliable yielder; but in most localities there is not enough of it to count as an asset. In Berlin, acacia honey is a leader. Perhaps the day will come when locust honey will become as common in Cleveland, Cincinnati, and Chicago.

M. Alin Caillaud, a prominent authority in France on the subject of honey analysis, has discovered that honey shows radio-activity. Some kinds of honey show the presence of radium more than others—notably so, honey from the department of Tarn and from Tunis. In *L'Apiculteur* he indicates by an illustration its effect on the photographic plate, showing a white striation not unlike the Milky Way on the sky. He says this is extraordinary, as honey is a vegetable production, and radium has been supposed to be purely mineral in its origin. At present it is extracted from pitchblende. He thinks this may account in part for the extraordinary value of

honey as a food and medicine. He attributes high values to various constituents of honey usually present in small amounts, but enough for the purpose. In this list are included potassium, formic acid, chlorides, azotates, and carbonates.

A congress of bee-keepers was held June 25, in connection with the Franco-British exhibition now being held in London. The meeting was presided over by Lord Avebury (Sir John Lubbock), who delivered the address of welcome. Here is the program: "The Development of Bee-keeping as an Industry," by T. W. Cowan, author of "The Honey-bee" and other works—also editor of *The British Bee Journal*; "The Influence of more than one Queen in a Hive," by a French Bee-keeper; "On the Choice of a Hive," by Walter F. Reid, Esq., F. I. C., F. C. S.; "Does the Size of the Hive Influence the Yield of Honey?" by a French bee-keeper; "The Cure of Foul Brood," by M. E. Sevalle, Secretary of the French Society of Apiculturists, and editor of *L'Apiculteur*, of Paris. That is a very fine program. It could hardly be better.

NOTES FROM CANADA

By R. F. HOLTERMANN

INSPECTORS FOR ONTARIO.

The following foul-brood Inspectors have been appointed for the Province of Ontario:

I. Essex, Kent, Lambton—W. A. Chrysler, Chatham, Ont.

II. Elgin, Middlesex, Perth, Huron—Jacob Alpaugh, Eden, Ont.

III. North Norfolk, South Norfolk, North Oxford, South Oxford, Waterloo, South Wellington, North Wellington—James Armstrong, Cheapside, Ont.

IV. Haldemand, Brant, Halton, Welland, Lincoln, Wentworth—Wm. McEvoy, Woodburn, Ont.

V. Peel, Dufferin, North Grey, South Grey, Simcoe, North Bruce, South Bruce—H. G. Sibbald, Claude, Ont.

VI. North York, East York, Ontario, Durham, Victoria—J. L. Byer, Mt. Joy, Ont.

In the remaining districts, owing to the difficulty of getting a thoroughly experienced man on the ground, an expert will be sent to inspect the district and find out what conditions are as to foul brood. Conflicting reports as to foul brood have appeared.

THE SEASON.

In Canada, particularly Ontario and Quebec, quite a number of colonies have perished during the past winter and spring. The spring was, for bees, not as bad as a year previous, but the weather has been any thing but ideal. Colonies in shape are in many sections reaping a rich harvest at this date, June 26; basswood in this section promises well: conditions are favorable, but, as we all know, *something may happen*. The price of honey should not be low, but can not be as high as last year, as our imports of honey have, during the past ten years, increased thirty fold.

GENERAL CORRESPONDENCE

LEARNED BY EXPERIENCE.

Some Valuable Points Brought Out by a Study of the Results During the Past Year or Two; a Convert to the Use of Bee-escapes.

BY E. F. ATWATER.

I wish to confess that, after years of non-use of bee-escapes in comb-honey yards, I am now a convert to the merits of that most excellent little appliance. I am using more of them every year. I may even begin to use them to take off extracting-supers. But for either kind of honey they are surely grand at the end of the season or when bees are inclined to rob.

You, Mr. Editor, have sometimes admitted that Dr. Miller's scheme of a tent escape on a pile of supers might be better for some, as it would save an extra trip to the yard to put on the Porter escape. Barring the likelihood of thieves, please don't admit it again. You do not need to make an extra trip. When you make your regular visit to the yard, put escapes under the finished supers. Then at the next regular trip take off the supers above escapes and repeat the process. In the interval the bees are sure to leave the super above the escape (unless it becomes clogged), as they have 7 to 10 times as long as usual in which to pass through the escape. This plan is successful. I never heard of such a method of using escapes, but no doubt others have practiced the same plan. In localities where foul brood exists, each colony should have an escape. Where no disease exists, two or three supers may be put above each escape, making quite a saving; but it may somewhat disturb the "balance" of your colonies.

In foul-brood districts all honey should be taken off with escapes. All daub is cleaned up inside the super before it comes off the hive, so there is less likelihood of robbers getting a taste, or of honey, possibly diseased, getting daubed around. Use escapes.

HIVE-TOOLS.

There are hive-tools and hive-tools; but the best single tool for universal use is made as shown in the cut. It is made of good spring or tool steel. This is the handiest thing to use in lifting frames or division-boards; saves putting one

hand among the bees. The hook was also designed to pull out springs and wedges from supers. At D a slot is used to pull nails of various sizes. The edges are ideal for scraping and prying, and easily inserted in joints between hives and supers.

ARE LARGE ENTRANCES SO IMPORTANT?

Friend E. R., I want to give you a friendly dig on "The importance of a large entrance in

summer." While I prefer quite a large entrance, say 12 or 14 $\times$ $\frac{3}{8}$, yet I have seen so much evidence on the other side that I no longer believe that there is any great advantage in such entrances. I want a deep space ($\frac{3}{8}$ or more) under the frames to facilitate manipulation and avoid having frames attached to the floor when a hive shrinks excessively. Of course, the advantage of a deep space beneath the frames may be easily had without necessarily using large entrances.

If I used a space of more than $\frac{3}{8}$ inch under frames I should want the space to be much more, then fill with a loose frame of some kind, coming to within about $\frac{3}{8}$ inch of the frame—bottom-bars to prevent comb-building in the space, as the bees, if a little crowded, are very apt to fill a space much greater than $\frac{3}{8}$ inch. Mr. Yoder uses very small entrances and gets fine crops, and probably no larger a per cent of his bees attempt to swarm than among ours with their large entrances.

The same is true of the Dudleys, who, year after year, have taken some of the largest crops of comb honey in this valley. Mr. C. W. Dayton is another extensive producer who prefers small entrances. He thinks he gets better crops by using such entrances.

I must admit that the large entrance has but little influence on swarm prevention, and is often harmful in the spring when brood near the entrance is often chilled if the entrance is not properly contracted.

The large entrance may not be best where there is any disease, as robbers have too good a chance to steal treasures that may prove the undoing of the colony, and in outyards we can not at all times keep the entrances adjusted to fit the flow of nectar.

A WHEELBARROW FOR CARRYING SUPERS.

Really it pains me to see bee-keepers carry supers of honey from the yard to the shop. The cart will do on smooth ground; but on the average we prefer the wheelbarrow, and we send many hundreds of miles to get the *Daisy* spring wheelbarrow, as we know there is none other anywhere near so good, and we want the best. The *Daisy* is easy on the combs and easy on the man. At least one must be in each apiary. Better yet, have two so each man can use one. Their usefulness is not confined to taking off honey, as a large light box can be put on one; then when cleaning and scraping in the spring you have a good place at which to work and a good place to hold the cappings.

About the hive-carrier (page 557, 1907), you say, "Granted that his colonies are heavy and strong, two men can carry three as easily as they can carry one in his (Dr. Miller's) way." Please amend that to read, "Granted that *the two men* are heavy and strong," etc.

"An improved strain of bees," page 831, 1907. "Mate daughters of pure Cyprian mothers to pure Carniolan drones. Then daughters from these queens are mated to pure Italian drones." I know that this bee-hash results in good workers, and some of them are easily handled like any good Italian stock; but a few that are cross will be wonderfully cross, and will sicken ninety-nine out of one hundred who try them, from any further experiments along that line. By breeding again from the gentle colonies of this Cyprio-

Carniolan-Italian stock, possibly something may be done, as the Cyprian disposition is not so likely to recur. So far as color is concerned, I've had colonies of that cross, showing no trace of the Carniolan blood, but they are exceedingly prolific, and mostly white cappers of comb honey. Any cross containing much Cyprian blood will likely result in at least a few colonies that are perfect fiends to fight, and they will remember their encounter, and scour the neighborhood for days in search of innocent victims of their wrath. The best advice on Cyprian blood for the average bee-keeper is, "Let Cyprians alone."

ENTRANCES ABOVE EXCLUDERS.

Page 839, 1907, Mr. C. W. Dayton says, "Of course, it certainly is easier for the bees not to have the excluders on." Not so very much easier for my bees. I have an entrance above the excluder, which is utilized often by a large per cent of the field force. This entrance consists of a $1\frac{1}{2}$ -inch auger-hole with galvanized slide. I got the idea from friend Hansen, whose San Diego Co. "Sweetwater Apiary" was illustrated in GLEANINGS and the A B C book some years ago. Mr. Hansen values them highly. So do I.

DANDELIONS.

Page 840, 1907, that fine field of dandelions is much like some of this country. Some of my yards have thousands of acres of such bloom within easy range. During the past two springs the bees did well on them, though some years they yield little nectar. In 1906 and 1907 they put the bees in wonderful condition for the alfalfa flow, where they were plentiful.

DIVISIBLE HIVES.

The shallow-divisible-hive men (of whom I was once one of the most enthusiastic) sometimes say that the scarcity of lumber will be another point in favor of the shallow hive, as narrow lumber is cheaper than wide lumber. This might be a valid argument in a land where a tongued-and-grooved joint is unknown, or where no man ever thought of "butting" two narrow boards together to take the place of a wider one. I've used such hives, and they are fully as serviceable as any, and the joints are not even tongued and grooved. Boxes of some kinds are now made entirely of narrow boards, tongued and grooved, or fastened with metallic stays forced into the wood.

The really few (compared to others) who prefer the divisible brood-chamber are periodically possessed of the spirit of propaganda; but the vast majority who try such hives later abandon them, if all that I have seen and read is any criterion.

In many localities the man who puts a swarm or a colony in a single shallow brood-nest with supers above courts great loss, as the sections will be ruined with pollen and no preventive is known.

It would at least be charitable for the divisible-brood-chamber advocates to caution beginners with that hive against disaster from pollen in sections, as to many beginners it is a serious matter to lose the sale of a few supers of honey.

A QUICK METHOD OF CLEANING SEPARATORS.

One of the most monotonous, tiresome, and unpleasant jobs connected with large-scale comb-honey production is the annual cleaning of a vast

number of bee-gummed separators. In many localities the separators must be thoroughly cleaned every year or else the necessary fixtures can not be crowded into a super. Another result, but not at all a bad one, is that the sections will hold more honey, as the propolis acts much like

ATWATER'S METHOD OF CLEANING SEPARATORS.

cleats on the separator. For this reason some bee-keepers seldom clean their separators; but when they do, then they have a job of no small proportions. As no rapid and satisfactory method of cleaning separators has ever been given to the bee-keeping public I will describe a method of my own invention—a method far more rapid than any that has been used in the past, and it results in separators just as good as new, if you wish them so. One hand is not almost worn out from holding a knife, as in the old plan.

The drawing shows the plan fully. Just $18\frac{1}{4}$ inches apart we nail on it, at the ends, pieces of section stuff $\frac{1}{2} \times 1\frac{3}{8} \times 5$ inches. On these, and projecting $\frac{1}{4}$ inch inward, nail cleats $\frac{1}{4} \times 1\frac{3}{8} \times 5$ inches. This gives the cleated board complete, as at A. The cleats provide recesses at D D to engage the ends of the separators.

This cleated board is mounted as at C, with one end fast to a joist, the other supported by a diagonal brace.

B shows how the separator is to be put in place by springing it so the ends just go under the recesses at D D. It then lies flat, as shown in C. Now stand at M and take the drawing-knife by the handles. Keep the blade nearly at a right angle to the separator. With very thin separators you will find it necessary to do most of the cleaning from the middle toward you, and from the middle away from you, or the separator may spring out of place.

With thicker separators you may go at them rough-shod. When one side is clean, turn the separator over and repeat the process. Keep the recesses clean, and brush the loose propolis off the board occasionally.

After a little you will acquire the knack, and you will then find this the easiest and most rapid method of cleaning separators—a method that any hired help can easily master.

Meridian, Ida.

PRESIDENT ULRICH KRAMER.

A Brief History of Bee-keeping in Switzerland, Showing the Important Part that Kramer Plays.

BY DR. K. BRUENNICH.

[No American bee-keeper will object to the space occupied in this issue of GLEANINGS with a lucid account of what our brother bee-keepers in Switzerland are doing in promoting bee-keeping on scientific lines. We all admit that we owe much to the Swiss. Huber rendered us indebted for all time, and the little republic is always in the van of progress, be it bee-keeping or any other industry or science. Their love of liberty and independence enables them to carve out a path for themselves, and they never seem to lack leaders for any great work. From what Dr. Bruennich says, it is evident they possess in President Kramer, of the Swiss Bee-keepers' Association, a great man—one who is leading them onward and upward in apiculture. We are all glad to hear from our Swiss friends, and it is a pity we do not hear from them oftener.—W. K. M.]

The readers of GLEANINGS have seen from time to time the name of Ulrich Kramer, who, since 1896, has been President of our Swiss Bee-keepers' Association. To write the life of Kramer is to write the history of the successes of the Swiss bee-keepers, for the history of the S. B. K. A. during the last thirty years is closely connected with the name of Kramer. He is now 63. It was two years ago that I conversed with him about queen-rearing when he said to me, shaking my hand, "Still, it is a delight to live."

It is thirty years, perhaps, since Kramer the schoolmaster began bee-keeping. At that time the S. B. K. A. was very small, having possibly 200 members; but it was at a time when all the European bee-keepers had received a strong im-

A SWISS TENEMENT HIVE.

pulse from the bee-masters Dzierzon and Berlepsch, and quite a new life bloomed in the beeyards.

In 1887 we find Mr. Kramer elected actuary of the S. B. K. A., which had then 270 members. In 1880 he was the first "wander teacher" to instruct novices in apiculture. Since 1884 the S. B. K. A. has consisted of a number of affiliated associations (to-day there are 103), with the following number of members: 1885, 504; 1895, 6370. Some years previous, Kramer had had a colony on the scales, and in 1884 he introduced apicultural stations, where the managers have to make exact observations on temperature, weather, increase and decrease on the scales (during the season, every evening and morning), etc. Until 1906 he was chief of all those stations (to-day there are 33), in which the results of the observations were summed up and compiled. The reports of the apicultural stations are printed every year in a book about the size of this journal.

In these reports we get a general view of the weather during the year; then follow the conditions of the year; a table of temperature; winter losses; dysentery; the first brood-nests; preliminary honey-flow; development of the colonies; size of the brood-nest; May disease (paralysis); the swarming impulse; the period of swarming; consequences of swarming; the spring harvest; queen-rearing; the summer harvest; improvement of bee-pasture; autumn, wintering. Every report has a colored harvest-picture of a number of stations where we find the daily and nightly changes of the scales recorded in a clear manner.

In Switzerland, as elsewhere, honey has often been adulterated, or inferior grades of foreign honey have been sold as the finest Swiss honey. Kramer obtained in the town of Zurich a place

ULRICH KRAMER, PRESIDENT OF THE SWISS BEE-KEEPERS' ASSOCIATION.

BECHSEL AND PRESIDENT KRAMER LOOKING AT A FINE QUEEN.

for testing honey, in 1891. Here honey is examined chemically and by taste. For the latter, Kramer has hitherto been the expert. He can decide, by taste only, if you give him Swiss honey, from which part of the country the honey came from, and from which flowers it was secured. It is astonishing to see how reliable his tongue is—a fact which I have often had occasion to prove.

In 1897 Kramer introduced a feature which has been a great benefit to our honey-producers, namely, the control of the honey of the S. B. K. A. Every affiliated association has from five to seven men, composing a jury. These are to judge the honey as to its purity, ripeness, and taste. A sample of any dubious honey has to be sent to the central jury, of which Kramer was chief till 1906; and only that honey which answers to all claims can obtain the marking, "Controlled by the Swiss Bee-keepers' Association." In consequence of this our honey has much improved in purity and ripeness, and its reputation has been greatly enhanced.

In 1897, 105 bee-keepers with 2843 hives obtained 11,900 kilograms of honey.

In 1898, 17 bee-keepers with 483 hives obtained 1565 kilograms.

In 1899, 431 bee-keepers with 13,408 hives obtained 143,849 kilograms.

In 1905, 1505 bee-keepers with 35,717 hives obtained 384,076 kilograms.

In 1889 was published the first edition of *Bienenwaer*, by Kramer, Jeker, and Theiler—a book of which the chief part was written by Kramer. Since that time, six editions have been printed.

Kramer, having recognized the superiority of our native bees, in 1898 brought the aid of the S. B. K. A. to the breeding of the black race. He established mating-stations, remote places for the fertilization of queens with pure-bred drones. In the spring of 1899 he called together the "Rosenberg" in Zug, where we have our apicultural museum, a number of able queen-breeders for the first conference on "race breeding." He then chose a number of the finest colonies (there were but a few), and began the use of eggs from those colonies for the breeding of queens.

In 1898, three breeders sent 41 pieces of brood-comb; result, 106 fertile queens.

In 1899, three breeders sent 84 pieces of brood-comb; result, 1158 fertile queens.

In 1905, eleven breeders sent 149 pieces of brood-comb; result, unknown.

As chief of the race-breeding department, Kramer also watched over the sale of race queens.

In 1898, three breeders sold 55 fertile queens mated at five mating-stations.

In 1903, three breeders sold 104 fertile queens mated at eight mating-stations.

In 1904, twenty-three breeders sold 525 queens mated at eight mating-stations.

In 1905, nine breeders sold 457 fertile queens, mated at ten mating-stations.

A queen of a controlled race, mated at a mating-station, costs 8 francs, or about \$1.50; mated in the bee-yard, 6 francs; a little piece of brood-comb costs 2 francs.

Since 1902 we have had an insurance of 5 cents per colony; and last year we instituted our foul-brood insurance—5 cts. per colony—which will, as we hope, remove that bee-pest from our land.

Since 1896 Kramer has been president and cashier of the Swiss Bee-keepers' Association. In 1906 he was obliged to unburden himself of some of his duties, his health beginning to fail from neurasthenia. He trusted to younger ones his duties as cashier, as chief inspector of honey, and of the management of apicultural stations; but he kept his office as president of the S. B. K. A. and as chief of the race-breeding department—his favorite work.

Kramer has written, besides the *Bienenwater*, a great number of articles, especially in the *Schweizerische Bienenzeitung*, but also in German bee-papers. He is an unflagging investigator, and a very fine orator. As a president he excels, understanding exceedingly well how to reconcile opposite sides and confine discussions in the right line.

Ottenbach, Zurich, Switzerland.

SUPERSEDING QUEENS.

A Further Discussion on How Long a Queen May be Kept Profitably; Nature's Method of Superseding Produces Five-cent Queens.

BY J. E. HAND.

Notwithstanding the amount of space that has been devoted to the subject of requeening, there still seems to be a diversity of opinion upon the subject. It is safe to assume that no up-to-date bee-keeper would choose a played-out, run-down, and weakened queen from which to rear queens to stock his apiary, and yet that is just what is advocated by those who oppose the system of requeening. It is true that an all-wise Providence has planted deep down in the nature of the honey-bee the instinct to supersede a failing queen as a means of preventing the colony from becoming hopelessly queenless. In this as in all things else we recognize the wisdom of the Almighty; and yet is there any good reason why man should not step in and improve upon nature's methods of superseding as well as upon a thousand other things that nature has given us? It is true that some colonies will supersede their queens, even before the apiarist can detect any failure of the queen. If all colonies were alike in this respect there would be less cause for man's interference; but, unfortunately, some colonies will make no attempt to supersede a worthless queen until the

Tneilor.

Kramer.

Goldi.

Frey.

NOTED SWISS BEE-KEEPERS.

SWISS BEE-KEEPERS' CONFERENCE AT ZUG.

colony becomes too weak to amount to any thing in the way of storing honey.

The loss from this cause is far greater than is generally supposed. One whole column in a recent number of the *American Bee Journal* was devoted to quotations from eminent authors to prove that a queen lives from three to five years.

The writer of the article to which I allude seems to lose sight of the fact that the question is *not* how long does a queen *live*? but *how long is it profitable to keep a queen*? This whole subject is a matter of profit and loss in which dollars and cents are involved. A hen will live from ten to twelve years, and yet the profits from the first year's egg production have been found to be so much greater than any year after, that the up-to-date poultrymen are replacing their hens each year with pullets reared from their best laying strains. A Leghorn pullet, if properly developed and rightly handled, will lay almost constantly during the first year without becoming broody.

A queen is like a hen in that, after laying a certain number of eggs (the number varying with different queens), will become broody. In other words, she will begin to dwindle down in laying until her abdomen becomes quite slim. Right at this stage instinct asserts her power for the preservation of the colony, and queen-cells are built, with the result of either a swarm or a case of supersedure, according to the condition of the queen. If it so happens that her powers of egg production are not exhausted, another batch of eggs will quickly develop, and the colony thus thrown into an abnormal condition by having a

vigorous queen and queen-cells at the same time will cast a swarm. On the other hand, if the queen still continues to dwindle, and is exhausted, supersedure is the result.

A queen seldom arrives at this condition during the first year of her reign, therefore a colony having a queen of the present season's rearing will seldom cast a swarm. If the above deductions are correct, the idea of requeening each year is not so preposterous as some would have us believe.

In summing up the advantages of requeening each year we find, first, an improvement in our bees as the result of stocking each colony with a young queen reared by scientific methods from our choicest breeder. Second, young and vigorous queens will keep up brood-rearing later in the fall, and begin earlier in the spring, which means a strong force of bees for winter and a strong colony of workers for the coming harvest. Third, the queens being bred from one mother will be uniform, and will be likely to give uniform results in honey production. Fourth, there will be no weak or queenless colonies, and every colony will be able to give a good account of itself. Fifth, there will be no swarming—at least, none to speak of. Sixth, those who advocate requeening the second or third year will have swarming and more weak colonies in the spring. There is a class of bee-keepers who recognize the importance of requeening, but don't like to do the work that is necessary in order to rear the choicest queens, preferring to rear five-cent queens by simply removing the old queen and trusting to luck for the rest, and are laboring under the de-

lusion that they are improving their stock. It does not require an expert to decide that such a method is open to serious objection.

My bee-keeping friend who may read these lines, it is for you to decide whether you will allow your apiary to deteriorate as a result of natural supersedure or whether you will keep your queens until they begin to fail, meanwhile overhauling every one of your colonies four or five times every season to see if the queens are beginning to fail, and finally have the most of them do their own requeening in spite of your misdirected efforts to help them, or whether you will make a sure thing of it once and for all by requeening your apiary each year at a trifling cost, and greatly increase your profits by bringing your entire apiary to a higher state of permanent productiveness. I say *trifling* cost, because with the right system and a very simple equipment any beekeeper can rear his own queens and have them fertilized without having any nuclei; and no colony need be queenless for a single day except the ones that start the queen-cells, and these not over 48 hours. This simple method is fully explained in GLEANINGS, Dec. 15, page 1586.

THE QUEEN'S RELATION TO THE SWARM PROBLEM.

It should be understood that there are other forces that govern the real act of swarming, in a far greater degree than the mere presence of queen-cells; and unless these conditions are present there will be no swarming; and the queen, quickly passing the broody stage in which the mother instinct predominates, will quickly destroy every queen-cell that lies in her path, and she will find them all. I confess the above is not orthodox

as compared with the text-books; however, I submit it as the most reasonable theory that has yet been advanced as to why queen-cells are constructed, and why a queen will allow queen-cells to remain in the hive at certain times and not at others.

In conclusion, Doolittle is certainly right when he says that natural supersedure is one of nature's plans. The question is, do we want nature's methods in their crude form, or do we want nature's plans modified and improved by man's reason and ingenuity until the objections are all eliminated like a rose without thorns?

Birmingham, Ohio.

THE WHITNEY V. THE MILLER BEE-ESCAPE.

BY WM. M. WHITNEY.

I note what is said in *Stray Straws*, Jan. 15 and Feb. 1, about the Miller and Whitney bee-escapes for outside use, and would like to make an explanation of the working of the one bearing my name, illustrated on page 1150, 1907. The escape, of course, can be made to suit the needs of the apiarist. My business being comparatively small, and the matter an experiment, the escape-box was made of thin stuff large enough to cover six supers of sections resting on their sides crosswise on a table and about $\frac{3}{4}$ inch apart. The box, or cover, telescopes over the supers and rests on the table so that the line of escapes is at right angles to the line of supers—whether the supers should rest on the side or end depending, of

SWISS BEE-STATION AT SIGGENTHAL.

SWISS BEE-STATION AT ZELL.

course, upon the way sections are put in supers. The reason of this will be evident to all.

The escape-cones being in a row lengthwise through the center of the cover, and about $\frac{1}{2}$ inch above the top of supers, afford the only light into the box, thus attracting bees to the exit. It is amusing to see the bees rushing out faster than is possible to count them. I tried the mosquito-netting with escape; also cloth, but there seemed so much light where not needed that it did not work well; but when the above method was tried, it worked like a charm. In mid-summer the bees are not disturbed in their exit by outside bees; but late in the season, when the honey-flow is slight, they are likely to be. To prevent this I constructed a hood, or cover of thin stuff with wire-screen top, long enough to cover all the cones, 4 inches high and 4 inches wide. It is very light, easily handled, and when put over the cones it will be filled with bees from the box below every 10 to 15 minutes. When it is lifted, and turned upside down, it is amusing to see the bees leave for home.

Now about your comments as to the loss of

young bees. Did you ever notice nurse bees not old enough to mark their location occupying supers of sections? It is possible that a few might be found there; but I think it a rare case, as their work is among the larvæ in the brood-chamber. It was seldom that a dozen bees could be found after emptying half a dozen cases. In any event they should be shaken in front of any hive desired without fear of their being molested.

I think if Dr. Miller would try the above-described escape he would be pleased with it for outside work. It is not expensive. As he suggests, any bee-keeper can make it, or, possibly, find a box at some store, the right size; that is what mine was. The cone-escapes he can make himself at less than 10 cents a dozen, which can be tacked to the top of the box, or can be made in the form of a loose escape, as mine was, to slide into a space provided for it, in which case it could be removed when not needed to protect it from the weather, while the box could be left outside. I regard such an appliance as essential as the solar wax-extractor.

Evanston, Ill., Feb. 20.

SWISS BEE-STATION AT BERN.

CURING ALFALFA UNDER HAY-CAPS.

[The article which follows is copied from *Hoard's Dairyman*, of Ft. Atkinson, Wis., one of the best agricultural papers of this country, and the standard authority on dairying. The editor has had much experience with alfalfa, and knows the value of hay-caps. With hay-caps it is unnecessary to cut the hay before it is ripe.—W. K. M.]

The first crop of alfalfa is very difficult to cure. The time of year when the first crop of hay is made is usually moist, and the hay is invariably sappy and heavy, all of which hinder the rapid and proper curing of the hay. By the use of the hay-cap, alfalfa can be cured better, even if the weather be dry; and if it rains considerably the crop can be saved, which is very apt to spoil unless protected by the hay-cap.

We cut our alfalfa in the afternoon, and it is cocked up the next day. The first night's dew does not hurt it, and we want the leaves to wilt before cocking. They should not be permitted to become dry, for if they do the hay cures much slower, for a large part of the moisture of the stems passes out through the leaves if not permitted to dry.

The cocks should contain from 75 to 100 lbs. of hay, and, on the average, it requires four days to cure it after it is put in the cock. When cocked the hay-cap is put on. Of course, much depends upon the weather conditions. The hay, while in the cock, should go through a sweat, which helps to cure it and prevents it from going through the sweat again in the mow. Just before the hay is to be put into the mow the cock should be spread out for a few hours to the sun and wind. It should not be left so long that the leaves will become dry and break off in handling. The cloth in the cap is made from A sheeting torn into pieces 40 inches square, and to each corner a large washer, weighing about half a pound, is tied. These washers may be obtained at any hardware store.

The weights that are attached to the corners of the cap tend to keep the cloth tight over the hay; for as the hay settles, the weights drop closer to the ground. To shed the water well the cloth must be kept smooth and free from wrinkles, and to accomplish this the weights, when the caps are put over the cocks, should be several inches from the ground. This method gives the weights an opportunity to pull down constantly on the four corners of the cap.

Some have recommended that pegs be attached to the corners of the cap, and hook them into the hay to hold the cap over the cock. This system

would be all right if the cock of hay did not settle; but since the hay through settling would soon pull away from the cap, enough to loosen it materially and cause more or less pockets and folds in the covering, we do not recommend this method.

It might be added that the hay-cap serves equally well in the curing of clover hay. The advantage of the hay-cap is not only valuable in protecting the hay from rain but from the sun as well. The hay can be put up into cocks when it is green, and cured in the shade, which is better than drying it out in the sun. Hay cured this way is more palatable, and retains more of the leaves, because they do not become brittle, and break off. The leaves of the hay are the most valuable part of it, and any system that tends to cure them properly, and prevent losing them in the field, is, in our estimation, worth practicing.

CLOVER IN COCKS AND COVERED WITH HAY-CAPS, ON THE FARM OF M. T. WRIGHT, WISCONSIN.

A SIMPLE, PORTABLE TAKE-DOWN BEE-HOUSE OR SHOP.

BY E. F. ATWATER.

We have had too much experience with the system, if such it may be called, of hauling a tent and outfit to the out-apiaries. We have gradually abandoned that plan, as we are fully convinced that it is much more economical, and pleasant for all concerned, to have a building and the few necessary tools at each yard. When we began building shops for the out-yards we adopted the plan of the Townsend take-down houses, as described in *GLEANINGS* some time ago.

There are a few faults in the plan of the Townsend houses. First, they should be built higher, as more storage room for supers is cheaply added by making the building only two or three feet higher. The second fault is that the sills, etc., project *inward*, so as to interfere with piling supers closely against the wall. After building two Townsend shops we found that we needed

E. F. AIWATER'S TAKE-DOWN HOUSE AND SHOP FOR USE AT OUT-YARDS.

The illustration at the left shows the house in the flat, loaded on a hay-rack ready to be hauled to an out-yard. The view at the top shows a side and end panel set up. The bottom cut shows house when put together. Note that the silos, or 2 x 4's, are nailed on the outside to give clear piling room inside, and also more room. The panels are held in place by bolts passing through the intersecting ends of the 2 x 4's.

two or three more small buildings for storage at the out-yards; and as the yards at which they are to be used contain only about 100 colonies each, we decided on buildings only 10×12 feet, with the frame on the *outside*.

The cuts will make the construction clear. Each side and end is made in one piece with ship-lap running vertically. The roof is in two parts, and covered with rubberoid roofing. The door is 3×6½ feet, while the window is about two feet square. The cost, including a carpenter at \$4.00 for one day, is about \$30.00 each. Such a shop will hold six or seven hundred comb-honey supers, or half as many full-depth extracting-supers. One illustration shows the house in the flat on the hay-rack, just after arriving at the Linder yard. Another shows the house in the yard, about half set up. The third shows the house complete, with just a glimpse of the apiary at the right, and part of our hive and super-hauling rack at the left.

Meridian, Ida.

[This is one of the best-designed buildings that has been submitted to the bee-keeping public. The plan of putting the 2×4 braces on the outside, and bolting them together at the ends, is good—very good.—ED.]

WAX-RENDERING.

The Hatch-Gemmil Press versus the Hot-water System.

BY J. L. BYER.

During the past few years considerable has been written regarding wax-presses and the different methods of rendering wax; and it may be the opinion of some that these subjects are somewhat threadbare, and lacking of interest at the present time. However, it is a fact that, notwithstanding all that has been said and written, a large number of bee-keepers are still doing without a press, and annually *throwing away* lots of good wax which could, with a very little outlay, be saved; and the work of securing this larger amount of wax would not be nearly so great as is the case in securing a much less amount without a press.

In this connection, thanks of the bee-keepers are due such men as Hershiser, Gemmil, Hatch, and others for calling our attention to the frightful waste of beeswax, unavoidable with the processes of wax-rendering as practiced in past years.

My first experience in trying to get wax from old combs has, no doubt, been duplicated by nearly all bee-keepers, and the results were of such a nature that it is not to be wondered at that we rather dreaded the job and often allowed such combs to be destroyed by the moths, consoling ourselves with the thought that "there was not much loss anyway."

The first press that it was the writer's privilege to use was one built like the Root-German steam press, only considerably smaller. When this press arrived we thought the problem of rendering the old combs was solved; but after a couple of days' trial our enthusiasm waned quite rapidly, as it was found that, for any large quantity of

material to be handled, it would take weeks of work to finish the job; and as we came to the conclusion that our patience (to say nothing of our time) was not equal to the occasion, the machine was voted a failure.

We next purchased a press of the Hatch-Gemmil type, and have ever since used the same with pleasure and profit; but before giving any more particulars about this style of press I will give my experience with the Root-German steam press.

It will be remembered that Mr. F. Greiner, some time ago, wrote up his experience with this press in the columns of GLEANINGS, stating that he was almost tempted to give up trying to get the wax out of old combs, as the most wax he could get in a day with the steam press was about 15 pounds. Seeing this, Mr. J. F. Davison, of Unionville, Ont., asked me to try his Root-German press and see how much wax I could get in a day from old combs. In his opinion Mr. Greiner's estimate was about right.

To make a long story short, in the short time we used the press, results were much in accord with Mr. Greiner's experience; *but* before the day was up we had caved in the bottom grates of the machine. Quite a few have had this same experience; and, if I remember correctly, the senior editor of GLEANINGS reported something of the same nature. Used as it is supposed to be handled, for any great amount of combs, this machine is not to be recommended as it is too *slow*; but it will get the wax all right if one is not particular as to time. A number having these presses first melt up the combs in a wash-boiler or kettle, and then put the mass through the press; and, while this works fairly satisfactorily, yet there is a likelihood of putting in too much at one pressing for good results, and, as previously pointed out, there is the danger of putting on too much pressure and bursting the machine.

After using the Hatch-Gemmil press for some time, the claims of the Hershiser and other hot-water presses coming into prominence we started to save the slumgum from our press; and during the past four years we have accumulated quite a pile of this article. The treatment of some of this slumgum with one of these hot-water presses has, in connection with the requests of some bee-keepers, led to the writing of this article.

The press I have been using during the last week is constructed on the principle of the one described by Mr. Holtermann in GLEANINGS a short time ago, only the one I have is much stronger than the machine referred to. It is practically the same system that is used by Mr. Hershiser, only Mr. H.'s machine stands right on the stove or furnace, while the one I used has the mass of stuff to be pressed first heated in another vessel, then transferred to the press, all then being surrounded and covered with boiling water. An enormous pressure is applied by the two-inch screw with a four-foot crowbar as a lever; and just here I wish to remark that the screw as ordinarily used in the Hatch-Gemmil press is not, in my opinion, strong enough to do good work in pressing three or four cheeses as it is called to do if said press is worked over into a hot water machine, as is recommended by some. Three hundred and eighty pounds of slumgum was treated; and, by the way, that amount of material, thoroughly dry, makes quite a bulky pile of stuff to

handle. From this amount of slumgum we got 54 pounds of wax, or about 14 per cent.

This seems quite a large percentage, and I admit that I was surprised at the amount of wax obtained. However, those figures do not indicate that 14 per cent of the wax was left, as the 380 pounds of slumgum was the residue of 520 pounds of wax previously extracted. In other words, out of 574 pounds of available wax, 54 pounds, or about 9½ per cent, was left in the mass.

Then, again, some of this slumgum was saved at a time when I was not using the press in a proper manner; and it was noticeable that the slumgum of this winter's saving did not yield as much wax as did that of four years ago.

As nearly as I can figure, the way I use the Hatch-Gemmil press at present I have about 8 per cent of the available wax in the slumgum. I say "available," because I find that, with any process, some wax will be left; and, after repeated pressing for two hours under hot water, minute wax globules would continue to rise to the surface while using the hot-water machine.

In using this type a large amount of reserve hot water is absolutely necessary. We used a large agricultural furnace for heating and dissolving the slumgum, and an oil-stove kept a large boiler of water hot; yet our hot-water supply was not nearly plentiful enough. Four days' time was occupied in getting that 54 pounds of wax; so when fuel for the stoves is counted there is no great margin for handling the stuff. No doubt those who make a specialty of handling large quantities of slumgum have better facilities than we; but 100 pounds, or thereabout, is as much as we could handle in a day. The four days mentioned included the remelting of the wax.

Mention has been made of not using the press properly, and I wish to say that such is quite possible with the hot-water machine too. Before being shipped to me a friend had used this press in rendering quite a quantity of combs into wax. He obtained only a little over one pound of wax to every five Langstroth combs; and I am convinced that he made the cheese too thick, as on an average three Langstroth combs should yield about one pound of wax. Formerly I filled the form too full when using the Hatch-Gemmil press, and I now see the mistake of that course. As I use the press now, care is taken that the pressed cheese be not over ¾ in. thick. When pressed it should be quite dry; if over ¾ inch thick, and mushy, you are leaving a lot of wax. You will leave enough anyway.

It is advisable to have leather straps on top of the follower; and, after pressure is all on, reverse the screw, lift out the follower, and saturate the mass with a couple of dipperfuls of water. Replace the follower and press again, and with ordinary care a good job is assured.

A number have asked me what press I would get if buying now; and in answer I can only say that each will have to use his own judgment. Certainly for the bee-keeper with a few colonies I would recommend a press of the Hatch-Gemmil style. With the extensive bee-keeper it may be a different matter; but personally, even if I keep the hot-water machine, I shall certainly not discard my old standby, the Hatch-Gemmil—at least not until I see things differently than I do now.

Just a word as to the quality of the wax obtained from this slumgum. When we consider the nature of the stuff handled—moldy, mussy, and some of it as black as lampblack, believe it is casting no reflection on the hot-water system when we admit that the wax obtained is of very poor quality. Of the 54 pounds, 25 pounds has been melted twice, the rest once since taken from the press. Even the 25 pounds is very dark, and the smell of it is strong, not at all like the aroma of ordinary wax. While I expect to be able to sell it, yet I would not think of sending it to the manufacturers who get my wax at other times. If absolutely necessary I can use sulphuric acid, but I will not do so unless I have no alternative. Be it understood I do not blame the machine for the poor quality of the wax, as I am certain that wax from the same source, no matter how obtained, will necessarily be of inferior quality. As yet I have not tried this hot-water press with combs, so I can give no data along that line; but my experience so far convinces me that not nearly as rapid work can be done as with the unheated press. With any considerable quantity of old combs to melt I first run through the old press, and afterward, if necessary, reheat and put the residue through the heated press—i. e., after quite a quantity of the slumgum has been accumulated.

In conclusion let me urge every bee-keeper, even if he keep only a dozen or more colonies, to get some kind of press. He certainly will have it proved to him, after having used it, that it was a paying investment. If he is one of those who get "all the wax" without a press, of course he doesn't need to pay any attention to the advice given. But candidly I don't believe any such bee-keepers live in America.

Mount Joy, Ont.

[Our experience in using the Hatch-Gemmil press has shown us quite conclusively that the plan of pouring hot water over the cheese, and pressing again, though taking less time, does not give nearly as good results as the plan of throwing out the cheese after all the wax possible is obtained by the first pressing, and melting it up again afterward. The trouble with the first plan is that the cheese remains in the same position relatively, and the wax does not have so good a chance to escape as it would if the particles of the mass were entirely rearranged, so to speak. If the slumgum were gone over the second time in the Hatch-Gemmil machine it would take only a little over half as long as the first treatment, and we feel sure that the final loss could be reduced to 3 per cent.—ED.]

BREEDING DOMESTIC ANIMALS FOR BUSINESS.

Crossing Wild and Tame Species to Strengthen the Stock.

BY W. K. MORRISON.

Some fun has been poked at the Texan bee-keepers on account of their method of producing a new breed of bees. In justice it ought to be pointed out that Luther Burbank works on the same lines in producing new varieties of fruits, namely, by hybridizing distinct species of plants, and also by crossing distinct varieties with quite

different characteristics. Dr. Munson, whose work is equal to Burbank's, and perhaps more important, also works on the same lines, having originated a number of splendid varieties of grapes by crossing distinct *species* of wild and tame grapes. Working along such lines they have effected improvements at one jump which would have taken several generations to effect if done by the ordinary way of seed selection. Such varieties are probably much more permanent than those produced by selection.

It is practically the same in regard to animals. Prof. Cossar Ewart has succeeded at one bound in creating a new breed of horses by crossing the horse and zebra. Such an animal possesses great stamina and courage. It can probably live in Africa, where no horse can live on account of the tsetse fly.

In this country a cross between the buffalo and the cow produces a remarkably healthy and hardy animal able to resist blizzards, and beefy enough to compare with a Hereford graded steer.

Our most highly domesticated animals are the weakest, and most subject to disease. This is more particularly true of the race horse, which suffers greatly from diseases of the bone. Our thoroughbred cattle such as Holsteins, Jerseys, and Guernseys are subject to tuberculosis in a remarkable degree. Probably the healthiest horses in all America are the two wild ones belonging to the Zoological Garden, of New York. In size and appearance they resemble Arabian or Morgan horses. This shows that, the further we get from the true type, the greater is the risk of weakness. The high-bred English horses were no match for the half-wild ponies of the Boers. They could not stand the "grief" and hardship of a severe campaign. Texan ponies did far better, and there isn't a deal of difference between the so-called wild horses of Nevada and Oregon and the genuine wild horses of Asia.

Our efforts at improvement by selection are not always satisfactory in an esthetic sense. Our asses are very homely, whereas the wild asses are really beautiful, having short ears and elegant forms; our mules are homely; but a natural mule between the ass and the horse, or between the zebra and the horse, or between the zebra and the ass, are really beautiful animals; moreover, they are wonderfully healthy and hardy.

The cattalo is more noble-looking than the bull, and more robust than the buffalo—superior to either for several purposes. It is nearly the same in regard to domestic fowls. The best turkey is the wild turkey or its crosses, either to look at or to eat. The best goose for table purposes is a direct cross of the wild Canadian goose and the common domestic kind.

Our best table fowls are the game which very much resembles the wild chickens of India. The Dorking fowl closely resembles one of the wild species of chickens, and that, too, is a great table bird. Cross these two breeds and we get the best table fowl of all. In other words, our highly domesticated breeds lack stamina and fine health.

Another point is this: By crossing or hybridizing we secure "sports." In fact, every seed produces a new variety. When Burbank hybridizes two species of walnut, such as the Persian and American, every nut he plants produces

a sport, or new variety. In fact, he has had ten thousand new varieties of walnuts by this plan.

The so-called "Darwin" tulips are a case in point. These were produced by hybridizing. There is nothing in nature like them. Burbank produced a new species of flower by crossing nicotiana and petunia, and so on.

It is evident that the Texans are only following the lead of the ablest scientific breeders of our age when they cross the Italian, Cyprian, and Palestine bees. It is the quickest way to secure results.

[The crossing of these three varieties was tried in the early '80's; and while the resultant product showed up well in the supers it was very cross—so much so that many apiarists have been trying to breed it out ever since. There was another bad trait in the cross—namely, that it ran too much to breeding out of season. But this very quality that would not be desirable in the North might be valuable in Texas and other warm States where there are long seasons. Moreover, that very crossness also would be less pronounced, probably, than in the North. The principles that Mr. Morrison has enunciated are correct; but the bee-keeper of the North can not afford to get into his strain of bees some of the undesirable traits of the Cyprian and Holy Land bees. In crossing with other strains we should aim, of course, to weed out the bad and keep the good traits. To do this may require the skill of a Burbank. He who succeeds will have a strong demand for his stock at good prices.—E.D.]

THE TROUBLES OF AN AMATEUR BEE-KEEPER.

Spring and Summer Surprises.

BY F. DUNDASS TODD.

In April I became suspicious that my venture with duplicate queens was a complete failure, as I noticed the bees seemed to run from one entrance to another as they desired. It was my intention to leave the hives under their winter cover until well on in May, but it so happened the only possible croquet ground was in front of the hives, and occasionally a ball would run right up to the entrances. The children had played daily all the previous summer without a sting, but I felt the risk was too great to run for another year. If a change of location was necessary it ought to be done before the bees became very strong. So about the middle of April I removed the winter covering, which was as dry as tinder, the top of the box having been covered with tar paper. On opening the hives I found that all the introduced queens were missing, and that the bees were carrying the stores to the other side of the hive. Of course, I removed the division-boards. The hives were changed to the new location; and as they would be exposed to all northerly winds they were wrapped up in tar paper. The usual plan of obstructing the free flight of the bees, by boards in front of the entrance, was adopted, and there were really few bees lost by returns to the old stands.

The spring of 1907 was cold and wet, so that building up was very slow. I expected great

things from No. 1, as it had gone into winter quarters in splendid condition with plenty of bees and "millions of honey in the house." No. 2 had done only moderately, but had laid in lots of stores. No. 3 had plenty of bees—far more than No. 2—but had stored very little sugar.

To my surprise, No. 2, the weakest last summer, began to build up first. The best hive of last year followed slowly behind, while No. 3 seemed to stand absolutely still. On account of the weather I hesitated to examine; but in the middle of May I overhauled and found No. 1 almost solid with stores; No. 2 in fair condition, provided clover bloomed by June 1st as usual, while No. 3 had nothing over a day or two's food on hand. To avoid killing the grass on my lawn I had made stands of inch dowel rods passed through scantling set on edge—good stands by the way and inexpensive, but not suited for the Alexander feeders I had on hand. But something had to be done quickly, so I tilted up the front of the hive until it was about two inches higher than the rear, and shoved in a wedge between the bottom and the stand. Then from an old can I improvised a runway for the feed to start it through the entrance. Each night I poured about a pint of warm feed, consisting of equal parts of sugar and water, on to the bottom of the hive, and in the morning it was all gone.

White clover bloomed June 17, being about three weeks late; but the bees paid but little heed to it. But dandelions had bloomed as never before; and while my neighbors were lamenting and wrestling with the pest on their lawns I was content, for my No. 2 hive was fast gaining ground. The bees were hanging out at night, so I added a second body, put three full frames above, replacing below with empty ones.

July 4 my best hive got busy all of a sudden—there was something doing. No. 1 was gaining strength, and even No. 3 was making headway. I put supers on the first and third, though I expected nothing from the latter; but as I was to move at the end of the month I wanted to see what I could do. I was still running in competition with my friend, and desired to be on top.

Then the swarming fever developed; in fact, in that locality swarming seemed to be a mania. I was busy winding up my business affairs and packing furniture preparatory to a long western journey, and every minute was precious. Two more of my friends had followed my example into the bee-world; and since they were at business all day their wives were naturally upset when a swarm set off for the top of the nearest high tree. I got so I hated to hear the ring of the telephone-bell between the hours of ten and six. My own queen-cells were kept cut out, and my queens' wings were all clipped; but my neighbors were less careful. I have already said I never wanted to see a swarm of bees; but the honor has been thrust upon me. My son enjoyed the first one or two he went after, just for the fun of it; but it soon grew monotonous. Sometimes he would be on one side of the village, sweating over one swarm, and before he got back I would be, perhaps, thirty feet above ground, hanging on the stem of a slim tree that I suspected was never meant to sustain the weight of a man six feet in height. However, I always

responded when a woman's nervous voice came over the phone, "O Mr. Todd! our bees are swarming, and are settling right at the top of the tree at the back of the yard, just south of the chicken-house. What shall I do about it?" But there was no joy in the task. I always felt like the man who complained of being bothered with cold feet in bed, but the feet were not his.

Even my best hive cut loose one day. Somewhere I had read, or thought I had read, that queen-cells are always on the edge of the combs, and that it is not necessary to dig out all the frames in order to get at queen-cells with the Danzenbaker and similar hives. So once I just tilted back the hives and cut out the cells in sight; but on this occasion two had been started on the face of a comb, and of course I had missed them. My neighbors' bee troubles got too many for me. However, when the shout went up that my bees were swarming I did not hurry any, but proceeded to the hive, cut out the queen-cells, and waited for the return of the fugitives. Next day hive No. 1 played the same trick and got the same treatment.

What did I do with the queens? Nothing, for the very good reason that I never saw them. Theoretically they ought to have been hopping about on the grass in front of the hive; but, although I searched long and carefully, I never found them. They must have got back all right, because these same hives swarmed later in great shape. July 17 I sold out, and agreed to deliver to my successor, who lived eleven miles away. I was to get all sealed honey above the lower brood-chamber. I took from hive No. 2 45 lbs. of chunk honey; from No. 1, 11 finished sections; from No. 3, only one section.

Mcford, Oregon.

AGE OF LARVÆ USED BY BEES IN STARTING QUEEN-CELLS.

Do the Bees Ever Use Larvæ that are Too Old when Younger Larvæ May be Had?

BY DR. C. C. MILLER.

When a colony is made queenless, either by accident or design, the bees proceed to rear a queen, more likely several queens, from material already at hand. If a larva more than three days old is chosen, an inferior queen will be the result. Some have held that the bees, in their eagerness to supply the place of the missing queen, will select larvæ more than three days old.

Dr. E. F. Phillips made measurement of larvæ selected by queenless bees for queen-rearing, and by his courtesy I am permitted to give the results herewith:

SIZE OF LARVÆ CHOSEN FOR QUEEN-REARING.

A colony of Caucasian bees was made queenless at 11 A.M. On the second day at 2 P.M. there were eight queen-cells started. Their contents were as follows:

Empty	2
Larva one-half size of worker-cell (2 days)	4
Larva one-third size of worker-cell (2 days)	1
Larva filled worker-cell (4 days)	1
All these queen-cells were destroyed, and the colony examined again the following day at 2 P.M.	
Empty	3
Larva one-third width of worker-cell (2 days)	2
Larva nearly filled worker-cell (4 days)	2
Larva somewhat extended in cell (5 days)	1

All these cells were destroyed, and, two days later, at 2 P.M., the colony was again examined, with the following results:

Larva nearly filled worker-cell (4 days)	4
Larva becoming extended in cell	1
Sealed cell with larva straightened out	3

The ages of larvæ are merely approximate, and are based on the sizes of worker larvæ. Since queen larvæ probably grow more rapidly on account of extra feeding, it is probable that all these approximate dates are too high.

All larvæ were removed from queen-cells, and fitted into worker-cells to determine the size.

As befitting his position, Dr. Phillips has refrained from drawing conclusions, as if to say: "There's what the bees did; make the best (or the worst) of it." Although it is not the easiest thing to draw conclusions that are positive and exact, it will do no harm to analyze some of the particulars, and at least make some deductions.

Looking at the lot of eight cells mentioned at first trial, I fancy I hear some beginner say, "There's at least one case in which the bees made a bad choice, for the age of the larva is given at four days, plus, which no doubt means something more than 4 days old. If three days is the oldest that will do for a good queen, then certainly the larva in question must have been too old by more than a day." Not so fast, my good friend; don't you see that this larva was not necessarily four days old at the time it was selected by the bees? It was four days old when the examination was made, and that was two days and three hours after the bees were made queenless.

To come to any definite conclusion in this case we need to know just how long after removal of the queen the bees discover their queenlessness and get busy at starting queen-cells. Without looking the matter up, I think my memory is not at fault in saying that not long ago there was some discussion of the matter, both the editor and C. P. Dadant agreeing that it was within a few hours—one of them, if I mistake not, saying it was within the hour, or almost immediately. Let us figure at what time, after unqueening, this larva must have been selected to make it too old. Right here we run against a snag in that "four days, plus." Plus how much? For the sake of some basis to work on, let us assume it means four days plus six hours. Then if it was started when just three days old, it must have been selected one day and six hours previous to the examination. That would be twenty-one hours after the removal of the queen.

But it must not be forgotten that that "plus" might be more than six hours. Suppose we call it 18 hours. Then, if selected at three days old, the selection must have been made nine hours after unqueening.

I am free to confess prejudice in favor of the good judgment of the bees; and, rather than admit any lack in this regard, I would plead the possibilities in the case. It is possible that the bees started the cell within an hour after the removal of the queen, and it is possible that the "plus" may be not more than three hours. That would make the age of the larva at time of selection not more than two days and one hour old.

The majority of the larvæ (four) were less than three days old at the time of examination; so of course they were less than three days old when selected, and may have been less than one day old. The remaining larva was still younger.

Of the six larvæ started, then, five were most positively started when less than three days old, and it can not be proven that the sixth was too old, the strong probability being that it was the first one selected, as it was the oldest of the lot. It is very clear that those who say the bees are so lacking in judgment as to select larvæ that are too old do not find the proof of it in this part of the experiment.

The other two experiments are of no practical interest to the man who rears queens only from the first batch started. They are of interest, however, from another point of view, for those who say that the haste of the bees to rear a queen makes them select larvæ too old say also that, if the first lot be destroyed, the bees will have gotten over their haste and will then select younger larvæ. Does comparison of the different parts of the experiment prove this?

The average age of larvæ found at first examination was 2.33 days; at the second, 3.4; at the third, 4.5. Suppose it took the bees twelve hours in each case to discover the need of starting cells; then the average age of larvæ at the time of first selection was 1.83; second, 2.9; third, 4 days. It may be said that, in the first case, the bees would be longer in discovering their need of starting cells than in the other cases. But that can not possibly account for a difference of 2.17 days between the first and the last case. It may also be noted that, while it can not be proven that any larva in the first case was chosen when too old, there is clear proof that in the other two cases larvæ were chosen that, if not too old, were at least older than any in the first lot.

It may be urged that larvæ were older in the second and third cases than in the first. Yet at the beginning of the third period the queen had been removed just three days and three hours, and so abundance of young larvæ must have been present, the youngest being only three hours out of the shell.

I submit that the experiment does not prove that bees when made queenless select larvæ too old; nor that there is any gain by destroying the first lot of cells started and giving the bees a second chance.

Some one may say, "Well, suppose some one does hold mistaken views on the subject, what matter?" It matters for two reasons. One is that I believe it a libel on the intelligence of the bee to accuse it of doing so unwise a thing as to select poor larvæ when better can be had. That is a sentimental reason; the other is practical. It is that erroneous teaching in this regard is likely to frighten the every-day producer of honey away from what is for him the easiest and best way of rearing queens; and that is not only a practical but a very important thing.

I doubt if there's any ground for the error except prejudice. Prejudice, however, takes a powerful grip on one. There's Editor Hutchinson, a man who has sometimes shown himself the personification of unprejudiced fairness, who holds tenaciously to this error, with no inclination to set himself right, and to do justice to the bees. I have coaxed him, I have defied him, to make a very simple experiment that I think would convince him—simply to unqueen a colony, and then look 24 hours later and say how old were the larvæ he found in queen-cells. Then he

could return the queen. The experiment would cost him little; but, no! he falls back upon his old experience, real or supposed, and says he has tried it; and he reared poor queens. Well, I've tried it, and I've reared good queens. But neither of those two things is exactly to the point. Let Mr. Hutchinson give us something in the way of clear proof that bees made queenless are in such haste to rear a successor that they use bad judgment in their selection, or else stop maligning the bees.

EXTRACTING-TOOLS.

How to Prevent Robbing when the Extracting is Done During a Honey-dearth.

BY E. D. TOWNSEND.

The tools for the yard work in harvesting a crop of extracted honey consist of a Daisy wheelbarrow, two empty hive-bodies, two Cogshall bee-brushes, one of the latest four-inch smokers, and three robber-cloths. The last named are nothing more nor less than cloths two or three inches larger than the top of a hive with sticks, nailed on each long side. One of these cloths is laid over the hive after the cover is removed, to keep out the robbers; and as it is quickly rolled up far enough to take out a frame, and then rolled back, the whole top of the hive is never exposed at one time. The cleats for the two long sides of the cloths are made of pieces of lath 20 inches long. One edge of the cloth is wrapped entirely around one of the pieces, when a second one is laid on top of the wrapped lath, and nailed. The cloth now comes out between the two pieces of lath, and is thus firmly secured. Two more pieces are nailed on the other side of the cloth, which makes it complete. The sticks must, of course, be on the long side of the cloth rather than on the ends, so that they will be parallel with the top-bars. In this way it is very easy to roll the cloth back just far enough to lift out a frame.

In removing the honey from the hives the row furthest from the extracting-house should be begun on first, so that it will not be necessary to work at any time in front of the disturbed colonies; for if the work is done when there is no honey coming in from the field, robbers are always troublesome. Place the wheelbarrow back of the hive and put one of the empty hive-bodies on it lengthwise so the frames may hang parallel with the barrow to prevent unnecessary swinging and shaking. The other hive-body should be placed at one side of the colony, leaving a space between for the operator. When the hive is to be opened, the smoker should be working well; and as soon as the cover is removed the bees should be given a gentle puff of smoke. If too much smoke is given, bees become demoralized, some flying out and others running across the combs, so that the results are not at all satisfactory. There should be no smoke blown down between the combs, therefore, until most of the bees have run off the top-bars of the frames, and started down toward the lower part. When bees are

once started properly, there is no trouble in keeping them going, especially if the honey is all capped (as it should be), for the idea is to keep the bees ahead of the smoke as much as possible. When about three-fourths or more of the bees are smoked out of the upper story this should be quickly lifted off and set on the empty body that has been placed near by for the purpose. It is important to be quick about this, so that none of the bees may have time to run back. If there are more stories to be taken off, repeat the whole operation, setting additional stories on top of the one first removed. When the first story is taken off, quickly cover one of the hives with one of the robber-cloths, as the bees will soon "boil over," when there will be trouble in putting on the cover without killing the bees. Having the bees nearly all smoked out, a comb should be lifted with both hands and then held over the entrance of the hive. In that position it may be held with the left hand in the original position while the right hand holds the brush. A slight turn of the wrist exposes either one side of the comb or the other to the brush. This part is clearly illustrated by the engravings, pages 1244, 1245, Oct. 1, 1906. Two sweeps of the brush on either side of the comb are usually sufficient to remove the bees with the exception of a few stragglers next to the bottom-bar, which are allowed to pass out through the bee-escape on the honey-house windows later. As fast as the combs are brushed they are put into the hive-body on a wheelbarrow. If the first three combs are placed at the furthest side of the bodies, the further edge of the robber-cloth can be lifted up to get them in; but it is best to put the five other combs in from the front by lifting the front edge of the cloth. As a full upper story will yield about 50 lbs. of extracted honey, we wheel in only two at a load.

One great secret of success in extracting when there is no honey coming in from the field is to keep *all* honey away from the bees while it is being handled in the yard. Another secret is to avoid giving combs wet with honey back to the bees while the extracting is going on.

If it is desirable to return these combs to the bees for any purpose, they should be given just at night, when they will all be cleaned up by morning so that there will be no commotion.

The honey should be extracted almost immediately, so that it will not have time to get cold. In order to work to the best advantage there should be two operators in the extracting-house, and one to take off the honey and wheel it in. All honey to be extracted should be piled up near the uncapping-tank. While one person does the uncapping, the other turns the extractor and handles the honey, although sometimes the uncapper has time to help a little in some other work.

When uncapping, the end-bar of the comb should be rested on the pivot or point in the cross-piece of the uncapping-tank. It is best to use a long uncapping-knife, commencing at the lower end of the comb, and cutting deep—down even with the wood—with a drawing motion. As the knife reaches the middle of the frame it will be necessary to hold the comb nearly vertical to prevent the cappings from falling back on the comb instead of directly into the capping-

fox below from the outer edge of the knife. If the work is done well, the cappings, many times, fall down in one whole sheet.

While it does not take any great skill to operate the extractor, one should be careful, especially when the combs vary greatly in weight, to put them into the baskets in such a way that the reel will be as nearly balanced as possible. Where there are several combs to select from, one can usually pick out the ones that will balance the best, and, after the first two or three turns, the weight will be so equalized that the reel will run almost as evenly as if the combs were of the same weight in the first place.

NATIONAL CONVENTION NOTES.

Diseases of Bees to be Discussed.

One of the most serious disasters that can visit an apiary is that of foul brood, either American or European. All should be constantly on the watch for it. Every bee-keeper ought to be able to recognize it instantly, and know exactly what course to take when it is found. Not only is foul brood a great misfortune to the owner of the diseased colonies, but it is a serious menace to surrounding apiaries.

For these reasons, one whole session of the National convention is to be devoted to the discussion of diseases of bees. Dr. White, of the Apiarian Department at Washington, has consented to take up the bacteriological feature; show us how cultures are made and the diseases propagated, etc. Some one of the inspectors will tell us how to detect the diseases, another how to treat them, etc.

BEE-KEEPING IN HAWAII.

We bee-keepers of the United States might be surprised if we knew all about the keeping of bees in Hawaii. It seems that Uncle Sam thought it of sufficient importance to send a special agent, our friend Phillips, of the Apiarian Department at Washington, out to these islands to investigate this industry. He spent several months studying the industry, and we have been fortunate enough to secure his promise to tell us, at the coming National convention, all about the bee-keeping of Hawaii, illustrating his talk with stereopticon views taken while at the islands. Those who are fortunate enough to be present may expect a treat.

LIVE-BEE DEMONSTRATIONS.

Few things will attract and hold a crowd better than the handling of bees in a wire-cloth cage. A good demonstrator can do very effective missionary work at such times, or, if at a fair, large quantities of honey may be sold at such demonstrations. Of course, to a bee-keeper, the handling of bees is no novelty, but not every one of us knows how to handle bees in a cage in the most successful and agreeable yet novel manner, hence it will be interesting to know that E. R. Root has consented to bring a cage to the National convention, and give an actual demonstration of how he makes this exhibition.

HEADS OF GRAIN FROM DIFFERENT FIELDS

SWEET AND ALFALFA CLOVER IN ALABAMA.

When I first came south I thought that sweet clover would grow anywhere—that all I had to do was to scatter some seed and the work would be accomplished. Accordingly, I got a bushel of seed and scattered it freely in the woods and out of the woods. I cleared a small patch of level land and put it in, feeling confident I should soon have honey from it; but to my great disappointment I got nothing. In a few places it germinated, but soon dwindled and died. Early in the following spring I prepared a small piece of ground near the house, where it was very strong, and it came up nicely, grew most luxuriantly, and I felt sure I had gained my point, thinking what was needed was good rich soil to start in. When it was in full bloom, before it made seed I cut it, thinking the second crop would make the seed. I had seen it cut at all times in Illinois, and it always started again. In fact, no one thought of killing it by mowing; but to my sorrow my crop died just like oats or wheat. I was annoyed and perplexed, and I never tried it again. I have concluded that I should have mowed it above the first branch, or else allowed it to mature its seed.

I also tried alfalfa, but it died out. However, it was sown on very poor soil. Our subsoil is very dense, and I think the tap root of both these clovers finds that too hard to penetrate. Cow peas do remarkably well in this soil. Would the roots of the pea inoculate the soil for the clovers? If any one has succeeded I should be pleased to hear from him.

Hanceville, Ala.

A SAFE PLAN FOR INTRODUCING A VALUABLE QUEEN.

Having made several failures, and losing many valuable queens when following the regular plan sent with cages, I at last stumbled upon a plan like the others, yet enough different to make it worth telling. The plan is as follows:

After preparing and getting the colony in condition for the valuable queen I first put a queen-guard or trap in front of the entrance to make sure no flying virgin can get in. I then catch the queen from this colony, close the hive, and set it on a new location which can be near by for convenience. I set another hive-body, of similar appearance, on the old stand, and put some of the brood (two or three frames if plenty of brood exists) in the hive on this original stand. Quite a lot of bees will return to the old stand. Of course, I do this when robbing will not be bad, and I put weeds, grass, or leaves about the entrance to keep robbing down. One full comb of bees from the first hive after the queen has been caught will keep down the robbing unless it is during a honey-dearth, when it would be hard to prevent it. Two or three days after this is the best time I find to introduce the queen to the original colony moved to the new location. The zinc is very important, as a virgin queen might otherwise take possession of the hive, and the queen would never get out of the cage.

This is a modification of several plans, and only a slight modification of Dr. E. Gallup's plan given in GLEANINGS in 1881.

I came across this a few days ago when hunting something on safe introduction of a valuable queen.

This plan is intended merely for breeders of very valuable queens that one wishes to introduce without fail. It is too much work, as a general thing; but one can afford to take extra precaution with a very fine queen.

Lewisburg, Miss. W. T. LEWIS.

HERMAPHRODITE BEES; THE PUPA OF A DRONE THE WRONG END TO IN THE CELL.

Yesterday evening I opened a hive to see the progeny of a queen recently purchased. The young bees have been maturing for fully a week now, and I saw something which rather knocks me out. It was a bee with a worker head and body, and the back part drone. On further examination I found another with the back part seemingly half drone and half worker; then further on I found another the same as the first, with worker head and body and the back part drone. In those cases where the two were alike, the back or drone part is all yellow; whereas the one half-and-half was yellow down the one side, and marked like an Italian worker on the other. The worker progeny are all nicely marked, three-banded, and light.

Another strange thing I saw this spring (but it was only a freak) was a drone which, when turning endwise when in a larval state, had turned his head toward the center of the comb. It was in worker comb, and, after maturing he died. I happened to notice that the workers had the mouth of the cell open and eaten away for some distance down the side of the drone. I took him by the wings and pulled him out, but it took quite a tug. You will understand that his shoulders, being too large for a worker-cell, caused this.

D. CHALMERS.

Poole, Ont., June 23.

[Once in a great while there will be a queen that will produce hermaphrodite bees or drones. Almost any queen-breeder, if he does any business in queen-rearing, will see cases of this kind two or three times in a season; but it is very seldom that a honey-producer runs across it, and hence it is nothing strange that you should not have seen it before. It is very rarely that one finds a worker or drone with its head wrong end to in the cell. You will probably never see the like of it again.—ED.]

SHADE FOR BEES; COLONIES DO BEST IN UNPAINTED HIVES THAT STAND IN THE SUN.

My bee-yard 33 years ago was in a young apple-orchard, and about half my bees were placed in the shade, or partial shade of the trees, and the rest in the open. As the years passed on, and the colonies that stood in the shade died, others were transferred to their places, and so it went on for about ten years when I stopped replacing the dead colonies that stood in the shade, and from that day to this all of my bees have stood in the open sunshine; for, looking backward, how sorry I feel for those bees in the shade! They were doomed—they had no chance. Those bees in

the shade made but a small surplus, and at best were short-lived in comparison with those in the open. Since then I have taken note of other bee-keepers who kept their bees either in the shade of trees, vines, or bee-houses, and invariably, as they termed it, were "having such bad luck with their bees." They would all die out, and oftentimes their owners would courageously buy more and try again; but bad luck would continue if they continued the shade. To have success with bees the sun must shine on the hives—preferably unpainted hives—and the bees must be properly cared for besides. Take, for instance, the escaping bees that go to the woods and into hollow trees. It is the same—they are doomed. The great majority die the first winter, and the rest dwindle away the second summer or winter.

I would ask you, Mr. Editor, and the readers of GLEANINGS, to take a backward look into your own past experiences and say if I am not correct.

Plainfield, N. H.

H. C. DANIELS.

ALSIKE AND TIMOTHY.

There is a great deal of horse sense in the following excerpt from the *Northwestern Agriculturist*. There is no better crop than alsike and timothy where the climate and soil are suitable. Every bee-keeper who is located in an alsike neighborhood ought to keep the seed on hand and sell it as cheaply as possible. Many of them ought to grow it, both for fodder and seed. Alsike and timothy always sell at the highest prices when properly handled.

There is a growing demand for a combination of clover and timothy for hay and pasture in all sections of the Northwest. The medium and mammoth red varieties do not succeed on low moist grounds as well as the alsike, which also matures with timothy. The feeding value of alsike clover is superior to the medium red variety—in fact, is quite equal to alfalfa in that respect. Alsike and timothy also make a very profitable seed crop in many sections of the Northwest. This is especially true on poorly drained lands where crops of grain are grown with much uncertainty during a rainy season.

The writer has called the attention of our readers on several occasions to the profits arising from growing crops of grass seeds, especially timothy, on fields that are inclined to be wet during the spring months. The wisdom of the suggestion is appreciated this spring by people who have their low lands seeded to the tame grasses. The addition of a quantity of alsike clover seed with timothy increases rather than decreases its selling value on almost every market. Farmers prefer such a combination for hay or pasture, and the seedsman uses them in making his various pasture mixtures. When the alsike clover is ripe and dry, the seed thrashes out from the straw quite as well as timothy with a common grain-separator. This should be speeded high, and the seed crop fed into it rather slowly. In fact, to do an economical job of thrashing grass seeds about half of the crew of helpers should take a rest and enjoy seeing the others work. If the machine is crowded, waste—an expensive and needless waste—is quite sure to occur. Grass seeds will be in active demand next spring at good prices. Save the clover-seed crop in every instance. Fodder corn will take the place of hay, but there is no substitute for clover seed.

MORE IRRIGATED LAND FOR BEE-KEEPERS.

ACCORDING to newspaper report, Mr. E. H. Harriman, the great railroad magnate, has decided to finance a great irrigation project in Imperial County, Cal. The area which will be reclaimed is over 1,500,000 acres of the very best land. The present system of canals in the Imperial Valley will irrigate only 500,000; but this is the largest single system in this country at present. It is one of the finest spots for bee-keeping in the United States, bees being phenomenally successful, as well as fruit-growing and alfalfa hay.

W. K. M.

OUR HOMES

By A. I. Root

Receive my instruction and not silver; and knowledge rather than choice gold. For wisdom is better than rubies; and all the things that may be desired are not to be compared to it.—Prov. 8: 10, 11.

He that is slow to anger is better than the mighty; and he that ruleth his spirit than he that taketh a city.—Prov. 16: 32.

You know, friends, or at least most of you do, that I have a strain of White Leghorn fowls down in Florida that I think promises great things in the way of egg-laying; and before I take up my work again down there, say next November, I shall need a new male bird; and while I am about it why should I not have a pretty good one? While I do not think of going up into fancy prices (for I care little or nothing for high-scoring birds), I should like a male bird whose mother and grandmother were great layers. Well, I have got one—or at least I think I have. I bought him of the Glenolden Poultry-yards, near Philadelphia. Their sole business is to raise "trapped" fowls. I paid \$5.00 apiece for two cockerels whose mother had laid 220 eggs in a year. Now, before shipping them down to Florida I thought best to give them a careful test this summer here in Ohio. Accordingly I purchased three pullets, no relation to the cockerels, whose mothers also have made a fair record. As soon as they came to hand I gave them one of the cockerels, and set the very first eggs the three pullets laid. Mrs. Root insisted that the first eggs laid by pullets are not good for strong healthy chickens. But I was in a hurry to see how well they would do, and was agreeably surprised to have every egg produce a chicken but one, on the first trial. On the second trial I gave the hen 13 eggs, and she brought out 13 nice strong beautiful chicks; and they are a delight to me to study and watch, morning, noon, and night, and a good many times between.

What we have to do with, however, this beautiful bright morning, is with the first hen that hatched every egg but one. She is a Rhode Island Red, belonging to Mrs. Boyden. I "brought her up" last summer, and she *ought* to be a good young mother; and, in fact, she *was* one of the gentlest and nicest hens I ever saw. When she was sitting I could pat her on the back and admire her and call her pet names as much as I chose; but on the morning of the twentieth day, as soon as I came near her nest I found something had happened. She gave me to understand at once, very decidedly, that from that hour on it was to be "hands off" and no foolishness. In trying to get the eggshells out of the way of the chickens I got so many "digs" that I was obliged to get a bent wire and fish them out. By the way, it certainly is very desirable to have your sitting hens gentle and docile; to have pleasant relations between them and their owner, and I generally do have such a state of affairs. I got along with this hen very well by giving her a wide berth until one Sunday afternoon when a gusty thunderstorm came up very suddenly. She was a rod or two away from her home, under the stairway, and I was quite anxious to get her in and shut down the storm-door before the rain came. When I undertook to drive her she show-

ed fight; then I gently pushed her with my foot; but she had got it into her head that I was after her chicks, and in a little while she became frantic. I finally said, "Old lady, there is no time for fooling, and you might as well understand right off now that you are my property, and that I am going to boss things."

Now, I hate to confess it, dear friends, but right then and there, with a storm blowing almost a hurricane, I had a regular fight with that sitting hen. Yes, and the saddest part of it is I lost my temper. She bit pieces out of the back of my hand, clawed my wrists, soiled the cuffs of my clean Sunday shirt, and was not whipped even then. I finally decided to *choke* her into submission, and so I choked her, as long as I dared to, to make her be decent; but the minute I let up she showed me that she was not whipped a bit. I had an exceedingly plain demonstration of the old saying,

A hen convinced against her will
Is of the same opinion still.

May be my couplet as above is not exactly as it has been handed down from generation to generation, but it hits the point exactly. While smarting from the wounds on my hands, and getting a glimpse of my soiled Sunday clothing, I was most sorely tempted to "wring her worthless neck," and it makes me shudder now, as I think how *near* I came to doing such an inhuman, unmanly, and unchristianlike thing. I was so angry at that hen that it made me shake like a leaf. I tried to collect myself; but while doing so she contrived to get loose, and, either with her head or leg, she managed to give me another vicious dig. But I *did* stop and consider. If I wrung her neck there was a brood of chickens only three or four days old, without a mother, and a storm coming up. Then, again, I reasoned, what could be accomplished, even if I *did* by my superior brute strength crush out her life? As I began to cool off I reflected that her only sin—that is, if animals can commit sin—was the sin of *misapprehension*. She *meant* well; she was defending her chickens as God taught her to do, but she did not *understand*. Oh dear me! How many others are there in this world of ours whose only sin is like that of this mother hen! She *meant* well, but she had a wrong understanding of things in that little head of hers. I set her down near her home where her chickens were hatched; but although the big drops of rain were now falling she did not see her shelter nor understand *any thing*. She was crazy with rage. She went to scratching in the dirt in a frantic way because she did not know what she was doing. She cackled, and stepped on her chicks until I finally picked her up and placed her by main strength in her domicile; and after chasing the chickens out in the rain I succeeded in getting the last one out of the weeds and under shelter. In this last encounter I felt *sure* I could keep my temper down; but she was so exceedingly idiotic in her frenzy that I actually lost my temper again. I did not hurt her at all. I did not *do* any thing out of spite;* but I was sorely tempted. Let me digress a little.

A few days ago I was thinking I had not been angry for many long months, perhaps not for years, as I used to be; but this provoking sitting

*Be ye angry, and sin not.—Eph. 4: 26.

hen had stirred me up and reminded me that my old temper (or perhaps I should say my old *temper*) only lay hidden in the background, and I think it must have been hidden by only a *very thin* ambush.

Our first text reminds us that wisdom, or the ability to act wisely under all circumstances, is more to be desired than any thing else this world can offer; and our second one reminds us of the exceeding importance of ruling our own spirits, or keeping that wild demon that seems to be implanted in the most of us, if not all, in complete subjection. Under no circumstances should it ever be let loose. We can excuse a sitting hen or a dumb brute for getting into a frenzy of rage; but no human being should ever let any such impulses from the evil one prompt his actions.

I have not finished with my good friend Biddy, however. A few days later she was hovering her brood in the middle of the road leading from the barn to the street. A team was coming up, and I studied a little how to get her out of the way without a fracas. After I got her chickens out from under her I saw she was determined to fight, and so I gently gave her a "hist" with my foot clear up to one side of the road. Dear me! she came back and right up into my face like a perfect whirlwind. I grabbed her by the legs and caught her by the neck as I had on the former occasion, but not before she opened anew some of the scratches on the back of my hand, and, worse still, stirred up *also* that old temper. I was tempted again to wring her neck and not have such a vicious animal around; but the temptation was not nearly as strong as the former one,* and just now I have got two jobs on my hand. One is to teach this virago of a hen *decency*; and the other is to teach this *quick temper* of mine to behave in a like manner. I can say with good grace to both of these obstacles in my way, "Here! you keep back and down. I, through the grace of the Lord Jesus Christ, am going to be master and *ruler*."

Now, friends, this is a simple story. Some of you may wonder why I have told it at all. Well, I have told it because it illustrates humanity. Husbands and wives are quarreling with no more reason than there was why this mother hen and I should have differences.† Over and over again when we look into the matter we find it is misapprehension and misunderstanding. When Satan gets hold of them, men and women often act as silly and foolish as that mother hen.

*Resist the devil, and he will flee from you.—JAMES 4:7.

† I believe Mrs. Root is one of the kindest, most sensible, and best-tempered women in the world; yet if I were to be wicked enough to set about it deliberately, I might be able (Satan helping me) to make her as unreasonable and bad-tempered as that sitting hen. Suppose, for instance, I should deliberately and on purpose walk into some yellow clay such as we have here in some places in this part of Ohio, and suppose I should purposely walk over her clean kitchen floor, and suppose I did this again and again, and give her to understand I did it on purpose to vex her. I sincerely hope that none but a drunken man ever did such a thing. But I greatly fear there are men, and perhaps women, who show such a devilish spirit. God forbid, however, that any woman be found of that kind. As I was going to say, I fear there are men who, under the influence of Satan, deliberately nag and provoke the women they have before God sworn to love and protect. Well, whenever such a state of affairs comes to pass, nobody knows, who has not been there, what a frenzy of passion may be stirred up in even a woman's soul. I say "may be," mind you; for God's promises are all sure and true; and where Christ Jesus rules in the heart of either man or woman they will be saved from any temptation that this world has to offer; for "God will not suffer you to be tempted above that ye are able."

I told you some years ago of a man who wanted to move a building past a neighbor's house, and it was going to brush some of the shade-trees—may be break off a limb or two. The two neighbors got into a quarrel, and their wives and children became so absorbed in it that they came pretty near staying out in the street all day long, or at least while that house was going by. Lawyers were consulted, neighbors took sides, and it was the excitement of that part of the town for some time. But when they came to consider the matter coolly, they all decided there was really nothing to make a fuss about.

When Huber and I were taking that trip up through Northern Michigan, some people were afraid their horse was going to be frightened by our automobile. A woman got up in the buggy and gave Huber and me a piece of her mind. Before I could stop him, Huber retorted back to her, "We have just as good a right in the road as you have." I succeeded in quieting him; and I hope I convinced him, at least partially, that, as *our* method of conveyance was an unusual one, we had not *exactly* as good a right in the highway as they had, and when things became quiet we found the horse paid no attention to our vehicle at all, and I have found this to be the case over and over again.

There is one thing more I wish to consider. Had I given way to temptation, and wrung the neck of the poor mother hen by my superior physical strength, I should have succeeded in crushing out the life that God gave. I should have, in one sense, won the field, but would I have been any happier by so doing? There are several points to be considered right here. If a burglar breaks into your house at night, with a revolver in his hand, perhaps you would be excusable in taking his life—that is, in self-protection. It may be that the good of the community would demand that he be not permitted to live; but if this is true, by far the better way would be to have him put to death by law; but neighborhood quarrels are quite a different thing. Some years ago in our vicinity two men were quarreling over a very trifling matter. One called the other one a liar; and as it seemed to be the prevailing code at that time, and in that neighborhood, that one should knock a man down who had called him a liar, the other struck him a blow that killed him. In olden times where two men got into a fight the one who "licked" or killed his opponent was supposed to come out ahead. I believe it is not so much so now. If I were obliged to take the place of one or the other of those two neighbors I think I should prefer that of the one who lost his life. The man who killed his neighbor went to the penitentiary for a time; but an intimate friend assured me that his regret and remorse were so great for that act that he had had scarcely a moment's piece of mind since. Many times one is called on to act as peacemaker; but where both parties are in a frenzy of passion it is not only difficult but dangerous. I have heard of cases where one who interfered, with the best of intentions of stopping a quarrel, was either killed or killed somebody else before the matter was ended. I do not know how many temptations policemen have in handling men who are crazy with rage, or perhaps rage and drink together, but I think it very likely they

find it extremely hard at times to let reason and good common sense rule the day.

The great crying need of the present hour is for men of ability to fill important offices for State and for nation; men who can not be tempted by great opportunities to enrich themselves while they are discharging important public duties; men who can not be swayed from the straight and narrow path by any allurements that this world has to offer. We have had such men, who have lived and died with an untarnished and unstained record, and just now we need more like them—men who can be entrusted with all this world has to offer. How much would it be worth, dear friends, when you come to die, and look back over the record of the life you have lived, to feel that you have merited the precious words of the dear Savior, "Well done, thou good and faithful servant; thou hast been faithful over a few things, I will make thee ruler over many things; enter thou into the joy of thy Lord?"

Well, it is a fact, even if it is a sad one, that it is not only individuals who get into a frenzy through some misapprehension, but sometimes it is great bodies of people—a whole political party or perhaps a great religious denomination. Let me give you one illustration. First I clip from the *Missouri Issue* for June 19.

The official organ of the liquor-dealers' organization in Philadelphia in February last said, "It is the Anti-saloon League and not the Prohibition party which is chiefly responsible for the big conquests which liquor exclusion has been making in recent times." The League has no politics; it works as effectively in Democratic as in Republican communities. All parties look alike to the Anti-saloon League."

As I have been with the Anti saloon League from the very start up to the present time, I think I am in position to declare that the above statement is true. The Anti-saloon League is working for the kingdom of God and his righteousness, and nothing else. Now, to illustrate how we are misunderstood, and in a way that seems to me "perfectly awful," I want to clip again from this same *Missouri Issue*:

While we are fighting the brewers, the official organ of the Prohibition party, whose editor, by the way, is managing Dr. Palmore's campaign for the Prohibition nomination for the presidency, both editorially and in its correspondence, goes after the League, and the following is a sample of extracts from that paper, which have been recently going the rounds of the secular press:

"Damnable dope is local option, says State Chairman Stokes, editor of the *Kansas City Leader*, official organ of the Prohibition party."

Then follows extracts from the *Leader* where the editor of that paper gives it as his candid opinion that the Devil himself could not devise a more damnable dope than local option. Another where he says trying to demoralize Prohibitionists seems to be the principal business of that organization, referring to the Anti-saloon League, the organization which the brewers of this State would rather see broken up than any other opposition they have ever had.

Why, dear friends, is not this all wrong? I can readily believe that it was the Devil himself who suggested using such words to be applied to the Anti-saloon League. It is true that, from the very nature of things, especially in the way the Anti-saloon was started, we can not now pull down our colors and become a political party. We recognize the reason for the existence of that great political party, and God knows we have the kindest feeling toward them. We are glad to give them all the aid in our power; and as we are working for one common end, and with the great Father above us, why in the world should we not be friends and neighbors, even if we do not see things exactly alike? May God

help us all to take a lesson from the poor, mistaken, and misapprehending mother hen, and let reason and common sense rule, even in politics.

THE CANCER THAT IS EATING AT THE HEART OF OUR NATION.

The following is a clipping from the *Temple Appeal*:

The Republican party has held its great convention in Chicago, and nominated a splendid man, William H. Taft, of Ohio, as nominee for President. We have read the Republican platform which Mr. Taft has to stand on. We are sorry for him, and sorry for the Christian voters of the G. O. P. The great subject which is nearest the hearts and homes of America finds no mention in their platform. They dare not touch the cancer that is eating at the heart of the nation—the American saloon. The time is not far distant when the voice of the people of this land will demand a temperance plank in the platform of the party that expects to be voted into power.

To all the above I hope our readers can join with me in a hearty amen.

POULTRY DEPARTMENT

WHY THE EGGS DID NOT HATCH.

"Do you see that nice brood of chickens? Are they not beauties? There are just thirteen of them. That mother had thirteen eggs, and she hatched every one of them; and as they are now over two weeks old, if no accident happens she will raise every one of them."

The above was a remark I made to my sister, Mrs. Gray, while she was looking over our premises; but just as I finished Mrs. Root put in:

"Now, dear husband, you want to show her the *other* hen with only eight chickens (one a cripple), that had nineteen eggs and brought out only the eight chickens."

As there were several standing around (the occasion was on the Fourth of July), it raised quite a laugh at my expense; and somebody suggested that it was doubtless providential that Mrs. Root and I were united together so she could tone down a little my disposition to see the bright things, so that, taking us both together, people could get a fair and unbiased view of this world as it opens up before us. Yes, it is true that the very next hen that I set, with exactly the same kind of eggs that were laid after the successful thirteen, hatched only eight chickens from the nineteen eggs. I boiled the eleven eggs that did not hatch, so I could dissect them without having a disagreeable mess of it, and in order, also, to utilize valuable animal food. Some of you may criticise me here; but I have been in the habit of boiling the eggs that did not hatch in the incubator, and giving them to my young cockerels to see if any bad results followed. They became ravenously fond of them, and they seemed to take the place of other animal food to perfection. The practice might teach a flock of chickens to eat their eggs; but if given to a pen of cockerels that are kept by themselves I have never noticed that it did any harm. Now, why did not that next setting, right away after the successful thirteen, give a good hatch? Mrs. Root said I gave the hen too many eggs; but as I had repeatedly been successful with twenty or more I did not think so. An accident

gave me a clew to the trouble. The hen with eight chickens hatched them upstairs in one of the little poultry-houses. One night she climbed the stairs to go back to her old nest. The eight chickens could not follow, so they doubled up with the hen that had the thirteen; and I concluded I would save time by letting them stay, especially as their mother was a borrowed hen; but when I picked her up to carry her home (she belonged to Huber, across the way) she was so light that I uttered an exclamation of surprise; in fact, she was nothing but skin and bones; and then I remembered that, when I borrowed her, about three weeks before, she seemed to have so little weight I was astonished; but I thought that, with plenty of food, and nothing to do but to sit on a nest, she would fatten up all right. But it turned out the other way. She got poorer and lighter still. Why did I give such a poor scrawny hen *nineteen* eggs? Well, I did *not* give her the nineteen. I first had a good large fat hen with the nineteen eggs; but after she went out on a strike and threw up her job I went all around the neighborhood to get any kind of sitting hen; and that is how I got hold of this light one. Now, my theory is this: That hen was out of health, and she could not keep up the proper temperature, even during the last days of June. And the moral I would adduce is this: When you get a sitting hen to do a good job (especially if you are going to give her *nineteen* eggs), get a good big fat hen that has a good constitution and a lot of stored-up flesh and blood to furnish the proper amount of bodily heat when needed. It just now occurs to me that the hen that hatched every one of the thirteen eggs used to get off her nest and stay for two or three hours during warm days. Yesterday, July 5, I noticed a hen that had a little inclosure about her nest, so that the other hens could not disturb her, got off her eggs in the middle of the day, and sat down beside them, instead of over them, for all of two hours; and the sitting hens that do the best work often take almost a "half-holiday" when the weather is quite warm. One very successful hatch came off when the mother was away for a couple of hours when two or three of the eggs were chipped. Of course, the weather was very warm; and although I was tempted to think she did not know her own business, the *result* seemed to indicate that she did. One of the poultry journals has suggested that an ordinary sitting hen has more wisdom in her little noddle than all the great incubator manufacturers and poultry people of the whole wide world massed together; and I confess that I often feel like uncovering my head and sitting down at the feet of a sitting hen when she stands up beside her nest, and tips her little head to one side as if to say, "You may bring on your scientific man and scientific books; but after you have got them all piled up, not all of you together know as much about this business as I do."

DUCKS, APPLE-BLOOM HONEY, ETC.

You may wonder what ducks have got to do with apple-bloom honey; and, by the way, quite a few of the friends have inquired anxiously about my ducks this season. Well, I am *sorry* to tell you I am not in the "duck business" at present—not because I have lost interest, for, in fact, it

is just the other way; but it was because I became satisfied that no one should think of keeping ducks unless he is off on a farm or where there are no neighbors very near.

As my ducks became older they seemed to be more and more inquisitive. At first the neighbors laughed at their queer actions, and said they rather liked to see the ducks around. But pretty soon they got to be a little *too* inquisitive. They were not only inquisitive, but they had a fashion of sampling every thing that looked as if it might be good to eat. In fact, I could not get a single blossom from my perennial peas last year because the ducks would, by some hook or crook, snap off the blossom-buds. Ducks are great explorers. Every day they went a little further, and I am just now waiting until I can get off by myself somewhere (may be down in Florida), where I can renew my acquaintance with those odd friends of mine, the Indian runner ducks.

On page 1157, Sept. 1, last year, I told you about my friend and neighbor, Mr. Philip Bohlei and his ducks. Well, he has over one hundred young ones already, and his first hatching has just been sent to market. Last year he got 60 cents each, live weight; but this year the price is somewhat better than that. He is on a good-sized farm, with no neighbors near. The ducks wander into a brook that runs through the woods nearly a quarter of a mile from his house. These ducks almost board themselves this season of the year. If you are interested you had better turn back and read the article I have mentioned. Well, I want to tell you this last day of June that Mr. Bohlei is also something of a bee-keeper. I think he got a few colonies last spring; and he has just surprised me by bringing me a jar of apple-bloom honey. In fact, he has extracted during apple-blossom time 240 lbs. from 7 colonies, and it was all sold quickly to his neighbors at the rate of \$1.00 a gallon. You may begin to suspect what I have just found out, that Mr. Bohlei, with his nice family of boys and girls, is one of the men who succeed in almost every thing they undertake. The family all get up early in the morning, and they not only know how to work, but I think they *love* to work. So you see it does not make very much difference whether it is ducks or bees or general farming. They always have their dish right side up when it rains honey, even if it be for only just a day or two during apple-bloom as it did here in Ohio.

HOW TO MAKE A HEN'S NEST.

Mr. Root:—The box you described on p. 768, June 15, is ideal, but the contents is where we differ. Fix your box as you described; then go to some good sod land, cut a piece of sod a little larger than you wish your nest to be, and let the sod have green grass on it three or four inches long if you can get it. Place it on the box. Now take some clean straw and make the sides of your nest to keep the eggs from rolling out, and place your eggs on the sod. The green grass will soon turn yellow, and the eggs will be on a nest as soft as a pillow. In the winter months the cold air can not come up through the bottom of your nest to chill your eggs, and in summer it keeps cool. Your hens will sit better, the eggs will hatch better, and this is my way to make a nest after fourteen years of experience in raising poultry. I am a cripple, made so by having my hip dislocated while playing base ball fourteen years ago. I can not do a day's work, so I turned to poultry, which I have studied very closely.

In the month of March I set nine hens on 135 eggs. They broke but one, and hatched 122 chickens, strong and robust. The eggs seem to draw some moisture from the sod. The nest stays clean and sweet—no foul smell about it, even when used the second time.

HIGHLAND FARM QUEENS

are the result of years of careful selection and judicious breeding from the best honey-gathering strains of superior long-tongue red-clover Italians in America and Italy. Highland Farm methods will produce perfectly developed, long-lived, and prolific queens. If you want bees that will winter well, build up rapidly in the spring, and roll in the honey, Highland Farm queens will produce them. We are now sending queens of this celebrated strain by return mail at the following prices:

	1	6	12
Select untested queens	\$.75	\$4.00	\$ 7.50
Tested queens	1.25	6.00	10.00
Select tested queens	1.50	8.00	15.00

Safe delivery and satisfaction guaranteed. Send for queen circular—it tells why Highland Farm queens are superior to others. Address all orders to

J. E. HAND, BIRMINGHAM, ERIE COUNTY, OHIO.

GRAY

CAUCASIAN

QUEENS.

1905-1906 Queen-breeder in Apiary of Dept. of Agriculture, Washington, D. C.

During that time Caucasians were being distributed by the department so that I handled many of the imported queens and bred much of the stock which other breeders are using, and am in a position to furnish the best of Caucasian queens. They are hardy and prolific, but not great swarmers; are builders of white combs, great honey-gatherers, and their extreme gentleness has won for them the name "STINGLESS." Queens are reared from imported mother of gray type. Have three-band or leather-colored Italians also. They are hustlers.

GRAY CAUCASIANS.

PRICE LIST AFTER JULY 1.

THREE-BAND ITALIANS.

Untested queens.....1, \$.75; 6, \$4.25; 12, \$ 8.00.
Select untested queens... 1.00 5.50 10.00.

Untested queens.....1, \$.60; 6, \$3.35; 12, \$6.50.
Select untested queens... .75 4.00 7.50.

SAFE ARRIVAL AND ENTIRE SATISFACTION GUARANTEED.

No bee disease ever in this section.

Descriptive circular and testimonials free.

LESLIE MARTIN, :: Birdcroft Apiaries, :: LEBANON, TENNESSEE.

ITALIAN QUEENS

And nothing but Italians. An improved superior strain is what QUIRIN-THE-QUEEN-BREEDER raises. Stock is Northern-bred and hardy—not a single colony lost during the past winter; have five yards, all wintered on summer stands. Am now taking off supers of nice white-capped clover honey. Prices of bees and queens as per below:

Prices of Queens after July 1.	1	6	12
Select queens	\$.75	\$4.00	\$ 7.00
Tested queens	1.00	5.00	9.00
Select tested queens	1.50	8.00	15.00
Breeders	3.00	15.00	
Straight five-band breeders	5.00		
Two-comb nuclei, no queen	2.25	12.00	22.00
Three-comb nuclei, no queen	3.25	18.00	32.00
Full colonies on eight frames	5.00	25.00	

All queens now go by return mail. Safe arrival and pure mating guaranteed. We employ 400 to 500 swarms. Can furnish bees on L. or Danz. frames. Add price of whatever queen is wanted to nuclei or colony. No order too large, and none too small. Over 20 years a queen-breeder. Address all orders to

QUIRIN-THE-QUEEN-BREEDER, Bellevue, Ohio.

ITALIAN QUEENS

Fine young prolific 3 and 5 banded Italian queen, untested, only 75c; extra-fine queen \$1; tested, \$1.25. Full colonies in 8-fr. hive, with queen, \$5.50; 3-fr. nucleus, with queen, \$2.75. Safe arrival guaranteed. Directions to introduce go with queen. Price list free.

A Chance for Some Choice

QUEENS

I have been breeding a few improved Carniolan queens this season. I think I have the finest lot I have ever reared, and will mail at once at the following prices (only one grade of queens to offer):

SELECT UNTESTED QUEENS.

One queen, 85 cts.; 2, \$1.50; 6, \$4.00; 12, \$7.80
Four-frame nucleus, including untested queen, \$3.50
Full ten frame colonies, \$7.00

W. W. CRIM, Pekin, Ind.

QUEENS of MOORE'S STRAIN OF ITALIANS

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardiness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the *Bee-keepers' Review*, Flint, Mich., says: "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, \$1.00 each; six, \$5.00; doz., \$9.00. Select untested, \$1.25 each; six, \$6.00; doz., \$11. Select tested, \$2.00. Extra select tested, \$3.00. Breeders, \$5.00 to \$10.00.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

J. P. Moore, queen-breeder, Rt. 1, Morgan, Ky.

ITALIAN QUEENS

Bred from best stock to be had in the country, and by best methods, insuring beautiful, vigorous, long-lived queens. Prices for 1908:

	1	6	12
Untested	\$1.00	\$5.00	\$9.00
Tested	1.50	8.00	15.00
Select tested	2.00	10.00	14.00
Breeder	5.00		
Two-frame nucleus	2.25	12.00	22.00
Three-frame nucleus	2.75	15.00	28.00
Full colony on eight frames	5.00	25.00	

Add queen wanted to above.

I shall offer no Caucasians for sale this season.

E. M. GRAVES, loamosa, San Bernardino Co., Cal.

W. H. Laws

says that, while his trade is very satisfactory, and about as large as he can handle, yet he does not want you who are new to him to forget that the very best of honey gatherers and a square deal is what you will always get when you buy Laws queens.

You should try his strain of Red-clover Long-tongue Italians, one firm alone having bought over 3000 of the Laws queens in the past six years; and more than half the queens sold this season are sent to customers who have bought in former years. A long string of testimonials testify to their merits, and you will make no mistake in buying Laws queens.

Single queens, \$1.00; 6 for \$5.00. Some very fine breeding queens on hand. Safe delivery and satisfaction guaranteed at \$5.00 each. Address

W. H. LAWS, Beeville, Bee Co., Texas.

ITALIAN QUEENS BY RETURN MAIL OR MONEY REFUNDED

Warranted, 75 cents each; six for \$4.00; tested, \$1.50 each. Circular free.

D. J. BLOCHER, PEARL CITY, ILLINOIS

Long-tongued

Red-clover Queens

Bred by their Originator

Do you want to get some specimen queens of the world-famous red-clover stock of Italian bees? Then buy from me, because I am the originator, and surely ought to know how to breed them in their purity. When you get them from me you know you have the real strain. For years I have devoted time and skill to this stock, trying to reach perfection. I can submit many splendid testimonials in favor of this stock to show my work has not been in vain. Try them, and YOU will be pleased also. I endeavor to please the practical man looking for definite results in dollars and cents. Many years' experience as head apiarist of The A. I. Root Co. enables me to fill the most exacting order with complete satisfaction to the purchaser. Let me show you how well I can please you.

Prices

Untested queen	June to October, \$1 00

SPECIAL NOTICES

By Our Business Manager

HONEY-PACKAGE LEAFLET.

We have finally got ready for distribution a four-page leaflet of honey-packages, some of which are not listed in our general catalog. This, together with our label catalog, we shall be pleased to mail on application to those interested.

SECOND-HAND CASES FOR DANZENBAKER SECTIONS.

We still have sixteen crates, of nine cases each, for twenty sections 4 x 5 x 1 3/8. In our last issue we mentioned eight cases to the crate, but find they are packed nine to the crate. Price, to close out, \$1.50 per crate, or \$20.00 for the lot.

ONE-FRAME OBSERVATION HIVES AT A DISCOUNT.

We have a few one-frame observation hives, slightly shop-worn, which we offer at reduced price to close out before taking inventory. They are almost equal to fresh new goods. There are seven with supers, which we will sell at \$2.25 each, and two without supers, at \$1.90 each.

SECOND-HAND 60-LB. CANS.

We have on hand from one to two hundred second-hand five-gallon cans, two in a case, in fair condition, which we offer at \$4.00 for 10 cases; 25 cases or over, at 35 cents. They are all looked over, boxes put in good shape, and no cans included which are rusted on the inside so far as we can determine by careful examination. They ought to be worth this price, especially for cheap grades of honey.

JAPANESE BUCKWHEAT.

Just after going to press with our last issue we secured 50 bushels of Japanese buckwheat seed in Wisconsin, which will undoubtedly be here before this reaches our readers. We inquired of one of the large seedsmen, and they wanted \$1.70 per bushel of 48 lbs. in ten-bushel lots. We can still supply seed in two-bushel lots and upward at \$1.50 per bushel, no charge for bags, although at this price we have very little margin. One bushel, \$1.75; half-bushel, \$1.00; peck, 60 cents, bag included in each case.

EXTRACTORS WITH POWER GEAR.

Since the publication of the last edition of our catalog we have developed a special gear for use on extractors intended to be driven by power, which adds five dollars to the price of the machine. A crank is also included, so the machine may be run by hand if any thing happens to your engine or other motive power. The gear-bar across the top of the can projects beyond the can far enough to receive a third bearing outside the pulley and belt-tightener. The bearings stand higher, and are much heavier. The cross-shaft is one inch instead of 3/4—the usual size on hand-driven machines.

HONEY-LABELS.

On the inside cover pages of this issue will be found samples of some of our honey-labels printed in colors. Our job-printing department is prepared to furnish promptly these and other styles which you will find listed in our label-catalog, mailed on application.

Bee-keepers can not be too careful or painstaking in putting up their honey for market in a neat and attractive way. When you look over the shelves of the modern up-to-date grocery and note the neatness and taste displayed in many of the tempting packages, you will see the reason for care and forethought in putting your honey in tasty and attractive form before placing it on the market.

UNTESTED QUEENS.

The very favorable conditions prevailing here at Medina have enabled our queen-breeders to produce a very nice stock of Italian queens, in sufficient quantity not only to supply our trade but to have some over. We do not care to go to the trouble and expense of having these queens tested more particularly, as it is not likely many of them are mated. Bee-keepers who are anxious to get a good strain of bees for their apiary will find this is a unique opportunity to secure something extra good at small expense, hence we think that we are doing them a favor by calling their attention to the opportunity. It is not every year we are in position to do this; but a happy combination of circumstances makes it possible for us to offer a lot of really good queens at a nominal figure. Remember a young vigorous queen is a great help in wintering, and in spring she is certain to outdistance an older one. Price for one queen, \$1.00; six, \$5.00.

BALL-BEARING EXTRACTORS.

For some time we have been on the lookout for a good ball-bearing at a price low enough to enable us to use it in our honey-extractors without greatly increasing the price. We have now found what we have been looking for, and propose from this time forward to equip all our extractors with ball-bearings. This we can not do at the regular price; but the machines will be so much improved in durability and easy-running quality that you will be well repaid for the slight additional price. In addition to the ball-bearings we are arranging a slip-gear device on all most all hand-power machines, to enable one to throw the gears out of mesh and stop the crank from revolving the moment you stop applying power, and allow the reel to spin on its ball-bearings, throwing out the honey while you uncup the next lot of frames ready to put into the extractor. None of these improved machines are in the hands of our dealers, as we did not get them perfected in time for this season's trade. You must not expect the new features on any extractors you may order this season unless you especially request it or mention it in your order. The revised price list, with these improvements, we expect to publish in the next issue of GLEANINGS. The increase in price over the present list will be from one to two dollars, according to size.

CLOSE-OUT BARGAINS IN TIN PAIS.

We have a little stock of tin pails, such as we formerly listed in our catalog, which we offer, to close out quickly, at the following prices:

RECORD'S
TIGHT-SEAL
COVER PAILS.

Of this style we have on hand, to close out, 163 No. 1, holding 1 1/2 lbs. of honey at \$4.50 per 100, \$7.00 for the lot; 102 No. 2, holding 3 lbs. of honey, at \$5.50 or the lot; 36 No. 5, holding 7 1/2 lbs. of honey, \$2.50 for the lot.

RAISED-COVER PAILS.

We used to sell large quantities of these pails for honey. We have the following to close out: 43 1-qt., holding 2 1/2 lbs. of honey, \$1.50 for lot; 144 2-qt., holding 6

lbs. honey, \$4.50 per 100; \$6.50 for lot; 100 nests of 1 and 2 qt., \$8.50 per 100 nests; 60 nests of 1/2, 1, and 2 qt., \$6.00 for lot; 250 1-lb. Jones pails, with wax-seal cover, \$5.00 for lot.

The prices named above are very much below what we formerly sold them at, and they could not be replaced now for anywhere near this figure. We offer them low to close them out quickly. First come, first served. Better name a second choice for fear the first may be gone.

CLOSE-OUT BARGAINS IN GLASS PAIS AND TUMBLERS.

We have a few remnants of stock in glass pails and tumblers formerly listed, which we offer, to close out, at greatly reduced prices. 5 bbls., 16 1/2 doz. each, No. 789, tin-top tumblers, holding 1 lb. of honey. Price to close out, \$5.00 per bbl.

Of screw-top glass pails we have 1 bbl., 16 1/2 doz., No. 776, holding a scant pound, \$5.50; 1 bbl., 12 1/2 doz., No. 777, holding a full pound, \$5.00; 2 bbls. 8 1/2 doz., No. 778, holding 1 1/2 lbs., \$4.50 per barrel.

RED-CLOVER QUEENS

200 lbs. honey from my breeding colony. Mostly red-clover honey. Untested queen, 65 cts.; tested, \$1.00; doz., \$7.00. Four-frame nuclei and fine tested queen, \$4. G. Routzahn, Biglerville, Pa.

C. J. BALDRIDGE, Homestead Farm,
Kendaia, N. Y.

FOR SALE.—Write for prices on clover, basswood, and buckwheat honey in 60-lb. cans and kegs; also comb honey and beeswax, all guaranteed to be pure.
W. L. COGGSHALL, Groton, N. Y.

FOR SALE.—Choice white and alsike clover honey in 60-lb. square cans, 2 cans to a case, at 9 cts. per lb., delivered at railroad station. Reference, agent or postmaster, Lakeville. St. Joseph Co., Ind., at which place address—
C. A. BUNCH.

FOR SALE.—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.
J. P. MOORE, Queen-breeder, Morgan, Ky.

FOR SALE.—1908 crop of Northern Michigan red-raspberry and clover honey; heavy body, light color, fine flavor. Price \$10.50 per case of 120 lbs. (two cans). Cash with order.

IRA D. BARTLETT, East Jordan, Mich. Box 156.

FOR SALE.—Our own production of comb honey, 4 x 5 plain sections, No. 1 quality, at 18 cts. per section. Our comb honey won every important premium in the State last year. If you have a place for some "gilt-edge" comb, write.

E. D. TOWNSEND, Remus, Mich.

FOR SALE.—10,000 lbs. clover and raspberry honey, ripened on the hive in sealed combs; delicious aroma, rich and ripe. This honey is the best a specialist can produce; 60-lb. tin cans, two in a case, \$10.75—any quantity. Sample on request.

F. B. CAVANAGH, Boscobel, Wis.

FOR SALE.—Our crop of raspberry extracted honey is now on the hives curing, and will not be extracted until nearly August. This will insure its being the *very best* that can be produced—rich, ripe, delicious. Then it will be put into new 60-lb. cans, two in a case. It is reasonable to assume that this rich ripe honey can not be produced as cheaply as the thin, watery, ordinary kind, and we shall have to get 10 cts. a pound for it on car. A sample will be mailed free.

E. D. TOWNSEND, Remus, Mich.

Honey and Wax Wanted

WANTED.—White ripe extracted honey; will pay cash.

GEORGE RAUCH,
No. 5343 Hudson Boulevard, North Bergen, N. J.

WANTED.—Comb, extracted honey, and beeswax. State price, kind, and quantity.

R. A. BURNETT, 199 South Water Street, Chicago, Ill.

WANTED.—We are in the market for No. 1 white extracted honey in any quantity. Correspondence solicited. State kind, quantity, and price asked. We also have for sale 60-lb. honey-cans, 2 cans in a case. Both cans and cases in A1 condition, at 30 cts. per case. MICHIGAN WHITE CLOVER HONEY CO.,
31-33 Griswold St., Detroit, Mich.

Texas School Lands

\$1.00 to \$5.00 Per Acre

Texas has passed new School Land Laws. Millions of acres are now to be sold by the State at \$1.00 to \$5.00 per acre; only one-fourth cash and no more to pay for 40 years, unless you desire; only 3 per cent interest. You can buy 160 acres at \$1.00 per acre, payable \$4.00 down and 40 year's time on the balance, 3% interest. Greatest opportunity ever offered to investors and farmers. Texas land is better than Oklahoma, Iowa or Illinois. Send 50 cents for Book of Instructions, New State Law and Map of Texas, and I will tell you FREE how to secure list of over 400 million acres of vacant public lands in 25 different States, which are open to homestead. Address E. C. HOWE, 784 Hartford Building, CHICAGO, ILL.

To bee-keepers sending their names and address I will send list of supplies that I have in stock up to June 30. On a cash order for \$10.00 or over I will give 8 per cent off; cash order for \$5.00 or over, 5 per cent off, delivered here at depot.

S. D. BUELL - UNION CITY, - MICH.

TIN HONEY-PACKAGES

FIVE GALLON (60-lb.) SQUARE CANS.

A five-gallon can is the favorite package for shipping extracted honey. There is no shrinkage and consequent leaking, no taint to the honey from wood as is so frequently the case with barrels and kegs. The cans, being made square, economize space, and are easily boxed. They are used exclusively in the far West.

SMALL SCREW-CAP CANS.

Besides the five-gallon square cans we list also the three smaller sizes—1, $\frac{1}{2}$, and $\frac{1}{4}$ gallon. These are furnished with 1 $\frac{3}{4}$ -inch lined screw cap like the five-gallon cans. We can also supply the five-gallon cans with 4-inch screw as well as the 1 $\frac{3}{4}$, at 5c each extra; and with an 8-inch screw at 15c each extra. Latter is largely used in Texas for chunk honey. Price of cans packed in boxes or crates given in the list below.

PRICE LIST OF SQUARE CANS.

Box of	1	5-gal. can	(60 lbs. capacity)	\$.55;	10 boxes,	\$ 5.00.	Weight per box	10 lbs.
" "	2	5-gal. "	(60 lbs. "	) .85;	" "	8.00.	" "	15 "
" "	10	1-gal. "	(12 lbs. "	) 1.50;	" "	14.00.	" "	20 "
" "	12	$\frac{1}{2}$ -gal. "	(6 lbs. "	) 1.50;	" "	14.00.	" "	20 "
" "	24	$\frac{1}{4}$ -gal. "	(3 lbs. "	) 2.40;	" "	23.00.	" "	25 "
" "	100	1-gal. "	(12 lbs. "	) 11.00;	" "	105.00.	" "	110 "
" "	100	$\frac{1}{2}$ -gal. "	(6 lbs. "	) 9.00;	" "	85.00.	" "	80 "
" "	100	$\frac{1}{4}$ -gal. "	(3 lbs. "	) 7.00;	" "	65.00.	" "	60 "

SCREW-CAP HONEY-GATE AND CAN-SCREW WRENCH.

Screw-cap gate, 15c; by mail, 18c. Screw-cap wrench, 10c each; 75c per doz; by mail, 4c each extra.

We furnish the gate for 1 $\frac{1}{2}$, 1 $\frac{3}{8}$, or 1 $\frac{3}{4}$ screw. Other sizes made to order from caps you may furnish.

The wrench fits a 1 $\frac{3}{8}$ screw, and can be used on 1 $\frac{3}{8}$ or smaller by a bushing between cap and wrench.

When you order these gates separate from cans we can not guarantee a fit unless you send us a cap from the screw with the order.

FRICTION-TOP CANS AND PAILS.

For packing honey in small tin packages we know of nothing better than package here shown. We do not carry these in stock, and offer them only for direct shipment from factory in original packages as indicated.

1-lb. can, 2 $\frac{1}{8}$ x4, from Maywood, near Chicago, in crates of 1155 at \$25.00 per crate.

2-lb. " 3 $\frac{1}{8}$ x4 $\frac{1}{2}$, " Hamilton, Ohio, in crates of 588, \$15.00 per crate.

2 $\frac{1}{2}$ -lb. " 4x4 $\frac{1}{2}$, " " " " " 462, 14.00 " "

3-lb. " 4 $\frac{1}{8}$ x4 $\frac{1}{2}$, " " " " " 420, 14.50 " "

5-lb. pail, 5 $\frac{1}{2}$ x5 $\frac{1}{2}$, " " " " " 220, 12.75 " "

10-lb. " 5 $\frac{1}{2}$ x7 $\frac{1}{2}$, " " " " " 116, 9.50 " "

Send all orders to Medina for unbroken crates as indicated, to be shipped direct from the point indicated only. The 1-lb. to 3-lb. have no bail, while the 5 and 10 lb. have a wire bail.

CARTONS for COMB HONEY

We are now prepared to furnish these cartons in several styles and in two grades of stock; also in various styles of printing. We can also execute special designs in quantities on special orders. Let us know your wants.

The Danz, open-end carton will enclose a section and pack in the regular shipping-case. We furnish it for $4\frac{1}{2} \times 5\frac{1}{2} \times 1\frac{1}{2}$ and $1\frac{1}{2}$, $3\frac{5}{8} \times 5\frac{1}{2} \times 1\frac{1}{2}$, and the several widths of the $4\frac{1}{4}$ section. To hold the carton in place on the section you need a rubber band around it. These bands are not furnished with the cartons except at an extra price, and only when so ordered.

The folding carton is of a different pattern from those heretofore furnished. They tuck in

at the top and bottom in a neater form, and are without tape handle. Sections packed in these cartons require shipping-cases made a little larger than the regular sizes, but such cases do not require glass. Some of our agencies have on hand some of the old style cartons in some sizes, which may be supplied on orders unless otherwise specified. These cartons are furnished for all regular sizes of sections; namely, $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{8}$ and $1\frac{1}{2}$; also $4\frac{1}{2} \times 5\frac{1}{2} \times 1\frac{1}{8}$. Other sizes furnished in quantities on special order.

PRICE LIST OF CARTONS.

Danz, carton, regular size, plain or printed name blank, 50 cts. per 100; 500, \$2.25; 1000, \$4.00. Weight, 4 lbs. per 100.

Folding cartons, regular sizes and grade, plain, 60 cts. per 100; 500, \$2.75; 1000, \$5.00.

Folding cartons, regular sizes and extra quality, plain, 75 cts. per 100; 500, \$3.25; 1000, \$6.00.

Extra for printing stock design, name and address blank, 50 cts. per 1000 one side; 75 cts. both sides for each color.

For inserting name and address in design at same printing, add 50 cts. for any quantity. For printing in name and address in a stock design, after that has been printed, add 50 cts. for 100; 75 cts. for 500; \$1.00 for 1000. Such cartons can be supplied only from Medina. Special designs or printing quoted on application.

AIKIN BAGS FOR CANDIED HONEY.

These are of tough paper coated with paraffine. Honey should be poured into them just as it begins to thicken by granulation.

1-pound bags, $3\frac{1}{2} \times 5\frac{1}{2}$, per 100	\$.65;	500, \$3.00;	1000, \$5.50.	Weight per 1000, 10 pounds
2 " " 5 " $7\frac{1}{2}$, " " "	.80;	" 3.75;	" 7.00.	" " 18 "
$3\frac{1}{2}$ " " 6 " $9\frac{1}{2}$, " " "	1.00;	" 4.75;	" 8.75.	" " 28 "
5 " " 7 " 10, " " "	1.20;	" 5.50;	" 10.50.	" " 35 "
10 " " $10 \times 10\frac{1}{2}$, " " "	1.50;	" 7.00;	" 13.50.	" " 45 "
Printing name and address extra, " "	.30;	" .75;	" 1.00.	

May be sent by mail for 18 cts. per pound for postage and packing.

Candied-brick Honey-wrappers.

We have developed a good trade in choice candied honey cut into $1\frac{1}{4}$ -pound bricks, like a piece of butter. These bricks are wrapped in parchment paper, placed in a folding carton, and a fancy white wrapper printed in gold with end-labels put on the outside. We can supply the parchment wrappers, cartons, and labels complete ready for use at \$7.50 per 1000 sets. With your name and address on the wrapper add \$1.00 per 1000.

Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

EASTERN GRADING-RULES FOR COMB HONEY.

FANCY.—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

NEW COMB-HONEY GRADING-RULES ADOPTED BY THE COLORADO STATE BEE-KEEPERS' ASSOCIATION.

No. 1 WHITE.—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

No. 1 LIGHT AMBER.—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separated honey to average 21 pounds net per case of 24 sections; no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

No. 2.—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separated honey to average not less than 19 pounds net.

Cases of half-separated honey to average not less than 20 lbs. net per case of 24 sections.

Cases of unseparated honey to average not less than 21 lbs. net per case of 24 sections.

SAN FRANCISCO.—Several cars of new honey have been sent east from El Centro, and practically all of the Orange Co. extracted honey has been bought by a San Francisco packer. The prices to growers on new crop extracted range from 5 to 6 cents. The crop in nearly all sections is very short, and prices are fully as firm as they have been for several months past. Packers prices, as quoted below, show no change. Water-white comb, 16 to 17; white, 16; water-white, extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 5½ to 5¾; candied, 5¼ to 5½.

July 18.

Pacific Rural Press.

BUFFALO.—The season for old honey is about closed. Very little is on the market not sold. But little new honey is arriving. The trade will probably buy sparingly until the weather is cooler and honey becomes more plentiful. No. 1 to fancy white clover, 16 to 17; No. 2 will not sell now.

July 17.

W. C. TOWNSEND.

CINCINNATI.—Quite a number of shipments of fine honey are now coming in, but prices are ruling lower than last season. In fact, we have never seen buyers so disinterested in a new crop of honey. We are offering the choicest at 14 and 15 by the single case. The demand for extracted honey is dull, which we attribute to the lack of activity in the business world; and, secondly, this is one of the duller months in the year. We are selling amber extracted at 5½ to 6½ according to quality and quantity purchased. Fancy white extracted honey brings from 7 to 9 cts. Beeswax is somewhat easier, and we are paying 27 cts. cash and 29 in trade, delivered here. The above quotations on honey are the prices at which we sell—not what we are paying.

July 21.

THE FRED W. MUTH CO., Cincinnati, O.

ZANESVILLE.—Some honey is arriving on this market from local producers, but practically none from outside except Cuban. For clover honey jobbers are offering 14 cts. for fancy, and 13 for No. 1. The wholesale price is scarcely established. There is a much improved demand for native honey, but scarcely any for the imported. Extracted in small retail packages is moving slowly. For good quality of beeswax I offer 30 cts. in exchange for beesupplies.

July 22.

EDMUND W. FAIRCE,
Zanesville, O.

CINCINNATI.—There is an abundance of comb honey arriving daily, but no demand for it. We can give no other reason than, perhaps, hard times. People do without it. There is a fair demand for extracted white clover, which is selling at 7½ to 8. Amber in barrels is selling at 5½ to 6. Beeswax, light demand, is selling at 33.

July 22.

C. H. W. WEBER, Cincinnati, O.

INDIANAPOLIS.—The demand is good, but prices very irregular and unsettled. Producers are offering fancy white comb as low as 12 cts., and white-clover extracted in five-gallon cans as low as 7 cts. Amber grades are not mentioned here at present. Beeswax remains steady at 28 cts. cash and 30 in exchange for merchandise.

Indianapolis, July 18.

WALTER S. POWDER.

PHILADELPHIA.—This has been unquestionably the greatest honey season we have had in the East for a quarter of a century. The first lot, of 3000 lbs., arrived in Philadelphia on the river boat yesterday, and was offered at 10½ for the amber and 12½ for white, no other sales being made. The market is not as yet established; but we are looking for low prices. Beeswax is firm at 28.

July 24.

WM. A. SELSER, Philadelphia, Pa.

KANSAS CITY.—The honey market has been somewhat slow on account of the abundance of cheap fruit. Fancy white comb honey in 24-section cases is selling for \$3.35. Now and then a few cases go for \$1.50; but \$3.35 is the ruling price. Amber and other off grades are selling as low as \$2.75. We do not look for much improvement in the honey market until after the first of September. White extracted is selling at 7½.

July 23.

C. C. CLEMONS & Co.

DENVER.—We are entirely closed out of comb honey, and ready to receive consignments of new-crop comb, the first arrivals of which should move quickly at good prices if fancy stock. Extracted honey is in fair demand. We quote white extracted, 8 to 9; light amber and strained, 6¾ to 7½. We pay 25 for clean yellow wax delivered here.

THE COLORADO HONEY-PRODUCERS' ASS'N,
Denver, June 23.

F. Rauchfuss, Manager.

BOSTON.—Fancy white comb honey, 17; No. 1 white comb, 16; California white sage, extracted, 9; California light amber, 8; Southern honey in barrels, slow sale, 5 to 6.

July 1.

BLAKE-LEE CO., Boston, Mass.

LIVERPOOL.—Honey is steady. Market prices are fully maintained. Chilean extracted, 4 to 6; Penuian, 3½ to 5½; California, 7 to 9; Jamaican, 4 to 5; Haiti, 5½ to 6. Beeswax is quoted, African, 29; American, 30 to 33; West Indian, 29 to 32; Chilean, 30 to 36; Peru, 33 to 34; Jamaican, 33 to 34.

July 18.

OHIO STATE FAIR PREMIUM LIST.

The following is a list of premiums to be awarded at the Ohio State Fair, Columbus, August 31 and Sept. 1, 2, 3, 4, on bees and honey to be exhibited in the farm-product department. Bees are to be shown in closed hives. Displays must not include honey entered for any other premiums.

Display of comb honey—appearance, quality, and condition for market to govern.....	\$15.00	\$8.00
Case of 24 sections white-clover comb honey—general appearance, filling, and capping to govern.....	3.00	2.00
Case of 24 sections of basswood comb honey.....	3.00	2.00
Case of 24 sections of comb honey from fall flowers.....	3.00	2.00
Display of extracted honey—quantity, quality, condition for market, and arrangement to govern.....	15.00	8.00
Six jars of extracted honey, 3-lb. (quart) size.....	3.00	2.00
Six jars of extracted honey, 1½ lbs. (pt.).....	2.00	1.00
Display of candied honey, not less than 25 lbs.....	5.00	3.00
Display of beeswax.....	2.00	1.00
Nucleus of Italian bees in observatory hive.....	3.00	2.00
Nucleus of Carniolan bees as above.....	3.00	2.00
Display of comb foundation.....	2.00	1.00
Largest and finest display of honey, comb and extracted—quantity, quality, and condition for market to govern.....	20.00	10.00

T. L. CALVERT, Sec., Columbus, O.

NEWCASTLE, DEL., COUNTY FAIR, SEPT. 1—4.

Dr. Joel S. Gilfillan, Supt., Newark; E. M. Miller, assistant, Wilmington, Del. Neither of the above will compete.

Best display of comb honey, not less than 30 lbs., \$5.00; second prize, \$2.00; ditto extracted honey, \$5.00; second, \$2.00. Best dozen sections of comb honey, \$1.00; second, 50 cents. Best sample of extracted honey, not less than 10 lbs., \$1.00; second, 50 cents. Best display of beeswax, 50 cents; second, 25 cents.

Bees.—Best colony shown in observatory hive, Italian, \$3.00; second, \$1.50; Caucasian, Carniolan, black, and hybrids, the same.

Best display of bees in observatory hives, not less than three, \$10.00; second, \$3.00.

Best display of bee-supplies, \$2.00; second, \$1.00.

STATE FAIR OF OKLAHOMA, OCT. 1 TO 10, AT OKLAHOMA CITY, APIARY DEPARTMENT PREMIUM LIST.

F. W. Van DeMark, Superintendent.

Open to the world.

1. Entries close in this department September 30, 1908, at 6 o'clock p. m., and all articles entered for exhibition must be in place at that time.

2. No premiums will be awarded in this department except as definitely stated in this premium list.

3. The judge will be governed by the code of rules adopted by the Illinois Bee-keepers' Association.

4. Two hundred and fifty pounds only will receive full score for comb and extracted honey, and 50 lbs. in candied honey; 50 lbs. beeswax will receive full score for quantity in display of beeswax.

5. Only one entry will be allowed each exhibitor for any one premium.

6. No article can be removed until the close of the fair, except upon written permission of the president.

7. The superintendent will be on the grounds for a week previous to the fair, prepared to wait upon exhibitors as they arrive.

8. The superintendent must check the entries shown in the entry-books in each ring, with the exhibits present, and so mark the entry-books that they will show what exhibits were passed on by the judges.

RASPBERRY HONEY

My brother and myself have five apiaries in the wild-red-raspberry region of Northern Michigan, where we are harvesting a crop of unusually fine quality. Not a pound is extracted until it has been thoroughly ripened and sealed over, and it is thick, rich, and delicious. We are putting it up in bright new 60-lb. tin cans, two in a case (the ends of the cases are bound with hoop iron to protect them in shipment), and offering it at ten cents a pound—\$12.00 for a case of two cans. To some this may seem a trifle high in price; but it must be remembered that it costs more to produce such honey as this, and it is worth more;

besides, to a certain extent it is a novelty. It is *raspberry* honey—a honey with a flavor all its own—a flavor that smacks of the wild red raspberry of the woods. It is the honey that won the gold medal at the Jamestown Exposition against all other honeys from all over the United States. The dealer who builds up a trade for this honey can hold it against all odds.

If not acquainted with this honey, send me ten cents and I'll mail you a generous sample, and the ten cents may apply on the first order that you send.

W. Z. HUTCHINSON, Flint, Mich.

LISTEN!

DO YOU HEAR THOSE BEES WORKING?

Soon they will want room or will swarm.

Have you gotten your hives and supplies? If not, send your order at once. If you have The A. I. Root Co.'s catalog you can order from it. We sell their goods at their factory prices. We can fill your orders promptly now. Write for further information and our 40-page catalog.

JOHN NEBEL & SON SUPPLY CO., HIGH HILL, MONTG. CO., MISSOURI.

BEE KEEPING

will be a profitable industry this season.

Honey is high—short crop last year. The shortage of the honey crop for 1907 in the United States warrants bee-keepers to increase their colonies. About a half crop was produced, and in California, where the cheap honey comes from, only a quarter of the average crop was produced.

Get Ready Now for More Honey

Let us send you our catalog. We are manufacturers and sell only our own make of bee-supplies. Minneapolis is the largest lumber-distributing point; the Mississippi river furnishes us power, and our organization and labor conditions are the best for economical production. Send us an estimate of your requirements and let us give you prices. We have a large stock of standard bee-supplies on hand.

The A. I. ROOT COMPANY
SYRACUSE, NEW YORK

TO THE BEE-KEEPERS of CANADA.

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the **QUALITY**. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, "The best is cheapest."

BOOKS FOR BEE-KEEPERS

The Swarthmore Library.

A series of booklets on bee subjects by E. L. Pratt, of Pennsylvania, known to the bee-keeping world as "Swarthmore." These books are full of the most valuable information. The Swarthmore method of queen-rearing is spoken of as the most important innovation in bee-keeping of recent years:

INCREASE. The first of the series. Any one desiring to enlarge his apiary should learn the Swarthmore way. Price, postpaid, 25 cts. French edition, entitled "Accroissement," 50 cts. postpaid.

BABY NUCLEI. The using of little frames and a handful of bees for mating queens has created quite a stir in the queen-rearing business. From this booklet you get your information direct. Price, postpaid, 25 cts. French edition, entitled "Nuclei Miniatures," 50 cts. postpaid.

COMMERCIAL QUEEN-REARING. A complete description of the Swarthmore methods of queen-rearing in regard to cell-getting. Price, postpaid, 25 cts.

FORCING THE BREEDING-QUEEN TO LAY IN CELL-CUPS. This little book rounds off the Swarthmore system. It is the finishing touch, and ought to be read by all queen-breeders. Price 25 cts.

SIMPLIFIED QUEEN-REARING. Revised edition. It tells the honey-producer how to rear queens by the very simplest method ever published. Good queens for little money and little trouble, in just an effective and economical plan for the bee-keeper who works for profit. Price 25 cts., postpaid.

Bee-keepers' Ten-cent Library.

The following books are neatly bound in attractive papers, well illustrated. Just the thing for the beginners to help them with their troubles. Price ten cents each postpaid.

No. 1. **BEE-KEEPERS' DICTIONARY.** It is often confusing to a beginner or one who is not acquainted with the literature of bee-keeping to understand the different terms used by writers on the subject. This book is intended as a reference work giving clear definitions of current terms.

No. 2. **INMATES OF THE HIVE.** We often hear, even at this late date, about the "King Bee." This book is intended to correct such erroneous ideas.

No. 3. **HONEY-COMB.** This is a little book showing the construction and development of the honey-comb, and is alike useful and interesting.

No. 4. **HANDLING BEES.** Valuable especially for the inexperienced.

No. 5. **TRANSFERRING BEES.** This book details the most practical present methods of transferring from boxes to modern hives.

No. 6. **BUILDING UP COLONIES.** Plain instructions for getting colonies into the best condition for the honey-flow.

No. 7. **THE HONEY-FLOW.**

No. 8. **SWARMING.**

No. 11. **WINTERING BEES.**

No. 12. **SPRING MANAGEMENT OF BEES.**

No. 13. **BEE DISEASES.** There has long been need of a better book on this subject. The book is written by Mr. E. R. Root, after long comparison and careful study of the writings of leading bee-keepers on the subject.

No. 15. **ESTABLISHING AN APIARY.**

No. 16. **MODERN QUEEN-REARING.** Detailing the latest methods, by leading breeders, embracing the best of several systems. We have also a French edition entitled "Elevage Moderne de Reines," and a Scandinavian edition entitled "Moderne Dronningavl," 25 cents each.

No. 17. **HABITS OF THE HONEY-BEE.** A condensed account of the life and habits of the bee in simple language.

No. 18. **BEE-KEEPING FOR CLERGYMEN.**

No. 19. **BEE-KEEPING FOR WOMEN.**

No. 21. **FACTS ABOUT BEES.** Just what it's name indicates.

No. 23. **BEE-KEEPING IN JAMAICA.**

No. 24. **BEE-KEEPING IN THE WEST INDIES.** A practical book written for the English Department of Agriculture, by W. K. Morrison, valuable for all tropical countries.

No. 25. **HOW TO PRODUCE EXTRACTED HONEY.**

No. 26. **THE DZIERZON THEORY.**

No. 27. **DOVETAILED HIVE AND ITS USES.**

No. 28. **DIVISIBLE-BROOD-CHAMBER HIVE.**
No. 29. **MOVING AND SHIPPING BEES.**
No. 30. **THE BEE-KEEPER AND THE FRUIT GROWER.**

Popular Works on Bee Culture.

The list of books below are for the most part by writers of well-known literary ability, and are very interesting indeed, and are greatly valued by bee-keepers and others for their literary merit, and the popular style in which bee-keeping is depicted and we are very glad to have the opportunity to offer them to bee-keepers and others. The description of each work will give a fair idea of the same, but a pamphlet giving an extended view of these and the practical books on bee culture listed in the preceding columns will be sent on application.

THE HONEY-MAKERS. By Miss Margaret W. Morley. This is the story of the life of the bee, told in very interesting style—how it lives, gathers honey, and all about it. While clothing the general subject with an air of poetry, it seems to be entirely within the limits of known facts while attempting to deal with them. We believe it will give all thoughtful bee-keepers a greater liking for their business to read it. Probably it has more to do with the curious traditions connected with bees than any other book of the kind. Price \$1.50 postpaid; by freight or express, 10 cents less.

THE LIFE OF THE BEE. By Maeterlinck. This is a masterpiece of fine writing by a modern Shakespeare. The words fly from the pen of this writer like sparks from a blacksmith's anvil, the result being a glorification of the honey-bee. Maeterlinck is considered by many to be the finest writer now living, and any thing from him is sure to be worth reading. He is, to a certain extent, familiar with bee-keeping, but the truth about bees does not interest him so much as the romance of the queen and the drone and the swarming instinct. The book itself is well bound and beautifully printed. Cloth bound, 42 pages. Ed. 1903, price \$1.40 postpaid; by freight or express, 10 cts. less.

THE BEE PEOPLE. A book on bees, especially for children, from the pen of Margaret W. Morley. Including its elegant illustrations, it is, in some respects, the prettiest bee-book in existence. It has 177 pages, very coarse print, the readings being ingeniously interwoven with the illustrations showing the parts of the bee. The story of bee-life is told in a fascinating manner, and is well calculated to get the casual reader, as well as children, interested in this useful insect. The cuts go just enough into detail to explain fully the lesson taught, without confusing the mind with other things. We think the book well worthy a place in every bee-keeper's home. Fittingly designed cover. Price \$1.50 postpaid; by freight or express, deduct 10 cents.

THE SWARM. By Maurice Maeterlinck, author of the Life of the Bee. This is a book of 113 pages, prettily bound in cloth. Price \$1.20 postpaid; by freight or express, 10 cents less.

THE BEE-MASTER OF WARRILOW. Tickner Edwards. Cloth bound, 64 pages; 57 cents postpaid; by freight or express, 7 cents less.

BEE MODELS. THE ANATOMY OF THE BEE.

There are a good many bee-keepers who will admit they ought to know more about the anatomy of the bee; but owing to the difficulties surrounding the subject they have thus far been unable to acquaint themselves in the least with the marvelous structure of the honey-bee. For such persons there has been constructed a *pasteboard* bee, showing all the internals of a queen and also a drone in a manner that leaves little to be desired. With the aid of the key, any intelligent person may soon become well acquainted with the anatomy of the bee and the proper name of each organ. First there is a life-like representation of the queen and drone (separately). By lifting the outer covering the breathing apparatus and digestive system are unfolded; lifting again there will be found the reproductive system and poison-glands; and by again lifting, the nervous system is clearly outlined. Every thing is as clear as daylight, as each part and organ is numbered, and the key which we send gives the correct scientific name of the same. Our models of the queen measure $6\frac{1}{2}$ inches, while those of the drone are $5\frac{1}{2}$ inches. We can furnish the two with a key for 75 c. postpaid; or either one at 50 c. postpaid.

The A. I. ROOT COMPANY,

- MEDINA, OHIO, U. S. A.

"If goods are wanted quick, send to Pouder."
Established 1889

THE BANKER AND THE BEE

By the Bee Crank.

"For our troubles," the bankers exclaim,

"It's Teddy who must bear the blame."

"But that's nothing to me," Says the industrious bee;

"I'm hustling this year just the same."

The bee-men, the fruit-men, and the farmers are not doing much talking just now, because they are too busy. When folks are busy they can't afford to have to worry about delays in getting the materials to work with. My business is so systematized that orders for all standard goods are filled just as promptly during the rush season as during the dull sea-

son, and you can avoid complications by placing your rush orders here. Just at present I am shipping immense quantities of shipping-cases, honey-jars, sections, and smokers. I have the full line of Root quality goods, and they go at factory prices.

Hoosier² Italian queens on return train for 75 cents, untested. Select untested, one dollar. Reared during the warm honey-flow, and nothing could be nicer.

I can use more beeswax, and am paying 28 cents spot cash or 30 in trade, delivered here.

Walter S. Pouder,

513-515 Massachusetts Avenue, Indianapolis, Ind.

STRAY STRAWS

DR. C. C. MILLER

DID YOU NOTICE in the platforms of the two great political parties any thing said about the greatest public question of the day, the saloon question?

HERMAPHRODITE, that's what the queen-bee is — *Bee-keepers' Review*, 205. Doesn't that go pretty well with the "sting trowel" and the "umbilical cord"?

I'VE ALWAYS supposed it was cheaper to buy new plain separators than to clean old ones. I'm not so sure of it after reading E. F. Atwater's way of cleaning them, p. 878.

LIKELY you are right, Mr. Editor, p. 868, that my tags were oil-soaked, and not paraffine-boiled. Allee samee, I hope this country will some day catch up with Germany on the tag question.

BASSWOOD flow (very little basswood here) lasted 11 days. [It did not amount to much here. In our locality a good year for the clovers means a poor one for basswoods. But this is not invariably so.—ED.]

BRO. DOOLITTLE gives sound advice, p. 871, about mastering "awfully cross bees," only for one thing; he doesn't tell us how he'd do if he wanted to find a queen; for after pounding them into subjection his chances would be small for finding a queen on that trip.

LOUIS SCHOLL, do we understand from what you say, p. 872, that you have tried bottom-bars with only $\frac{1}{4}$ inch between them, and that the space was filled with glue? I've supposed this is a gluey locality, and I've never found that space filled with glue—never once.

REFERRING to the question whether abundance of stores in sight has a stimulating effect on bees, Editor Hill says, *American Bee-keeper*, 190, "Mr. Hand contends that the influence would be the same on the bees as that of bins full of wheat on a flock of hens. It should be noted, however, that it would probably make some difference in results as to whether the bees or the hens had access to the surplus-food supply. Food locked up in the granary would hardly influence the egg-laying of the flock, nor would tons of honey stacked away in the loft of the house have any stimulating effect on the bees in the hive."

HEATING honey for extracting late in the season is a fine thing; but Allen Latham gives a needed caution, *Review*, 214. Late in November he had the honey stacked in an old hen-house, paroid-covered; ran the lamp slowly Friday, faster at night, and still faster Saturday morning.

The sun came out warm, and he says that, on opening the door at noon, he found all the top supers had melted down, and the honey was drizzling all over all the supers in the place. Some sixty combs melted down, and 100 to 200 pounds of honey was lost. Even then the lower tiers had not become nearly warm enough to extract.

J. E. HAND, p. 881, seems to think that natural supersedure and deterioration go hand in hand. Did you ever stop to think, friend Hand, that, in the case of bees not under man's control, unless the whole colony dies, *every queen before her death provides for a successor by natural supersedure*? Do you think an all-wise Providence would thus deliberately plan for deterioration? And if that deterioration has been going on ever since creation, ought not wild bees to be about deteriorated out of existence? [We find supersedure cells generally quite equal to those reared during the swarming impulse. But cells reared under ordinary conditions are much inferior to either.—ED.]

MORE THAN one egg in a queen-cell is a very reliable sign of laying workers. But lately I found five eggs in a queen-cell in a nucleus with an old laying queen. [If you were raising queens in baby nuclei, doctor, you would find that, when the queen had laid every available cell full of eggs, she will begin to stick in two or three and even five eggs to the cell. This is a very common observation in our queen-rearing work; and, of course, under those conditions we do not expect any laying workers. But we may safely say that, when there is plenty of egg-laying room, cells empty, and other cells containing a plurality of eggs, there is probably a laying worker or drone-layer in the hive.—ED.]

H. C. DANIELS, you ask us to take a backward look, p. 894, to see if we can not see bad results from having bees in the shade. When I look back I see the very best results from bees under good apple-tree shade. [Here too; and, what is more, we believe that bees are a little more quiet in the shade than out in the hot sun; or perhaps we should put it this way: When hives are obscured by shrubbery, trees, and the like, cross bees are not quite as likely to follow one as where there is clear unobstructed vision. For example, before our grapevines leave out, robbers and cross bees will follow one much more persistently than afterward. Of course, it might be said that, when the vines are in full leaf, then is the time when the bees are approaching the honey-flow or are in it. But there is a condition after the honey-flow in August, in our locality, that is far worse for robbers than in that season of the year prior to the full leaf of the grapevines. But as has been pointed out by others, we believe that too dense

a shade of a big tree is detrimental. While it is very comfortable for the apiarist, the bees do not spring and summer quite so well.—ED.]

YOU ASK, Mr. Editor, p. 867, whether my yellow bees (Italians) swarm more than my "hybrids and blacks," and say, "If all of them swarm, then we should attribute this swarming to the peculiarity of the season rather than to the yellow blood." I have no blacks. I have made special effort in the past two years to get in Italian blood, and a good number of my colonies are full-blood or half-blood Italians. The rest are of my old stock of hybrids. I have an impression that the season is the worst for swarming I ever experienced. But all have not swarmed. There are six colonies that have never had an egg in a queen-cell; three had an egg in a queen-cell just once, and when the egg was destroyed the offense was not repeated; four had a cell or two occupied on two different occasions, but have gone on since without starting cells again. Except these thirteen, every colony has swarmed, or would have swarmed, so far as I can judge, if special treatment had not been given. These thirteen were all of the old hybrid stock. Yes, emphatically my yellow bees swarm more than my old hybrid stock. But that is no proof that Italians swarm more than hybrids. Please remember that for years I have been breeding from bees that showed least inclination to swarm, paying no regard to color (more fool I), and they approximate non-swarming, not because they are hybrids, but because of special selection; and if I had held to pure Italians all the while I might just as well have had a strain of pure Italians little given to swarming. The one important point in the case is that there is some proof—quite a little I think—that by continued selection one can approximate a non-swarming strain. [As you say, the whole point is that you have attempted to breed out the swarming tendency, and that the same effort applied to pure Italians would probably have been productive of the same results.—ED.]

EDITORIAL

By E. R. ROOT.

A GOOD SUGGESTION.

THE following note from Secretary Hutchinson will explain itself:

E. E. Pressler, of Williamsport, Pa., stamps upon his stationery and price lists the following: "Will be at Detroit Oct. 12." Why couldn't all of us who send out much mail get a rubber stamp and do the same? It would advertise the National convention in a most telling manner.

CANE OR BEET SUGAR IN KANSAS.

WE notice by the *American Grocer* that the Kansas Board of Health, which has the enforcement of the pure-food laws of that State, says that grocers who sell beet sugar for cane will be subject to prosecution. We wish this ruling might be general all through the United States, as it is impossible now to know what one is buying—cane or beet sugar. We always try to get cane exclusively for feeding; but the large sugar-refiners will make no statement as to what they are sending, other than that it is granulated sugar.

AN OLD TIMER.

WE had a call last week from F. H. Cyrenius, of Oswego, N. Y. While our friend is not one of the "old boys," he is an old-timer. He began the culture of bees when he was only about twelve years old, and has been an ardent student of them ever since. He is considerable of an inventor as well as a practical man in the field. He has promised to give us some items for publication.

IS BEESWAX DIGESTIBLE?

THERE has been some little discussion among our exchanges as to whether beeswax is digestible. The fact that most hydro-carbons, including fats, oils, and the like, are digestible, lends color to the theory that beeswax, also a hydro-carbon, may be partly so; at least, Mr. D. F. Robinson, in the *Canadian Bee Journal*, last issue, presents some pretty good arguments, supported by the authority of experts on food, in favor of the proposition.

A BEE-VEIL WITH HOLES IN IT.

BY the way, did you ever notice that a bee-veil with a few holes in it is almost as good a protection from stings as one with no holes? Even if a bee should happen to get through an opening, it finds itself a prisoner and is then more concerned about getting out than carrying out its designs of vengeance. When we talk about holes we mean small ones, say a quarter or half an inch in diameter. Larger ones, of course, will let in a direct onslaught of bees, and then they strike their javelins without stopping to argue the question.

GOVERNMENT OFFICIALS STUDYING FOUL BROOD IN CALIFORNIA.

DR. E. F. PHILLIPS and Dr. White, the Bacteriologist, are just now on the Pacific coast doing some field-work experiments on bee diseases. They are gathering data, which, no doubt will be presented to the public in the form of a bulletin. In our last issue we spoke of what the Bureau is doing in Massachusetts and the bordering States. It is a pleasure to know that our apicultural investigators are giving close and careful attention to this subject of bee diseases.

THE IMPROVEMENTS IN OUR EXCHANGES.

IT is a real pleasure to see the gradual and steady improvement in our apicultural exchanges. Our contemporary to the north of us, the *Canadian Bee Journal*, has shown new life since it went into the hands of the new managers. Away to the south of us in Florida the *American Bee-keeper* is giving us once a month a great deal of practical and valuable matter. The *American Bee Journal*, still the "Old Reliable," is furnishing a large amount of interesting as well as valuable matter, with many illustrations; and last, but not least, the *Bee-keepers' Review* is showing the enthusiasm of an editor who is fresh from the field; for Mr. Hutchinson is a honey-producer. We wish all of our exchanges success.

THE FOLLY OF MARKETING COMB HONEY TOO LATE.

LET us not again repeat the folly of last year, when thousands and thousands of pounds of comb honey were dumped on the market after the selling season. Much of that is still in the

market candied and has a slow sale. This is most unfortunate just now.

Along in last October and November there was a crying demand for honey; but it could not be had for love or money. After the demand was well nigh over, and hard times were beginning to come on, along came this honey. If it had all been cleaned up it would be much better for the market.

A BEE-ESCAPE BOARD IN TWO PIECES TO SAVE LIFTING OF HEAVY SUPERS.

MR. F. G. MARBACH, foreman of our machine-shop, suggests making a honey-board in two pieces. With a hive-tool pry up one end of the supers and slip under the narrow piece. The other end of the super may now be lifted up just enough to provide proper clearance for the other piece, which is now inserted far enough to meet the first piece. His idea is to save all lifting by prying one end of the super at a time with a hive-tool. Any old honey-board may be fixed in this way by sawing off one end, the small one not being more than one inch or so wide. Some of our bee-keeping friends can try it and see how they like it.

FEEDERS NOT WORTH PATENTING.

WE are constantly receiving designs for some new style of feeder on which the sender has applied for a patent, adding that he would like to know how much royalty we would be willing to pay. As we have said repeatedly we say again, we would not give one cent for a patent on any kind of feeder, because there are too many good unpatented feeders, and any one who gets out a patent on a feeder is wasting his good money for nothing. We believe in patents, own a number, and are paying royalties on others. Hundreds of patents have been granted on feeders; but we do not know of one that has earned its owner a cent.

CAUCASIANS HARDY.

IN setting forth some of the desirable and undesirable traits of these bees in our last issue, page 869, we failed to mention one point in their favor; and that is, their ability to stand wear and tear. Some time ago we made up a colony of pure Italians and pure Caucasians, mixing the two races in one hive. For the first month or two there was about an equal number of both races in the colony. After that, the old yellow bees began to disappear, while the old Caucasians continued to remain in strong force. They are good for springing and wintering. Our experience has abundantly shown that; but we couldn't and wouldn't stand their excessive swarming and bee-glue.

SENDING DISEASED BROOD THROUGH THE MAILS.

WE desire to caution our readers again when sending samples of suspected diseased brood to this office for diagnosis to wrap the specimen in paraffine paper, not in cotton batting, and put it in a stout wooden or tin box. Mark on the outside of the package the full name and address of the sender, and in the same mail be sure to send a letter giving full particulars. Specimens not having the mark and name of the sender will be burned without examination, and likewise all other specimens loosely or carelessly packed.

Another thing, do not use perfumery-boxes,

spice-boxes, or, last of all, tobacco or cigar boxes, to send brood in, because the odor so scents up the brood that satisfactory diagnosis is made difficult if not impossible.

We are perfectly willing to furnish information to our subscribers, but they in turn must observe proper precautions.

"WAX CRAFT."

THIS is the title of a new work in the hands of the printers, taking up fully its history, production, adulteration, and commercial value, by Thomas William Cowan, editor of the *British Bee Journal*, and author of the *British Bee-keepers' Guide*; and numerous other apicultural works.

Chapter I. is historical; chapter III. treats on wax-rendering, taking up all the various methods for accomplishing this by the aid of the sun, by artificial heat, through the medium of steam and hot water. Chapter V. has to do with the subject of refining and bleaching wax, removing impurities caused by the introduction of either mineral or vegetable waxes; commercial waxes, refining, etc. Chapter VI. deals with the adulteration of wax, the extent of it, the adulterants, with a list of the various kinds of waxes other than that made by the bees. Chapter VII. deals with the manufacture of comb foundation; chapter IX. with wax candles and tapers. Chapter XI. treats of the technical uses of wax.

No work of this kind has been published before, and we are of the opinion that it will fill a long-felt want without question. The size of the work is crown octavo. The price in paper covers is 2 shillings; in cloth, 3 shillings.

THE CHICAGO DRAINAGE CANAL AND THE SWEET CLOVER NOW GROWING ON ITS BANKS.

ON p. 940 is an article with engravings in regard to sweet clover on the banks of this great drainage canal. This reminds me that, on my return from California in the fall of 1903, I was greatly impressed with the piece of engineering as planned and carried out for that great canal. At the close of the article referred to above, we are told that they expended \$53,000,000. Well, there are places where the soil, stones, and gravel are piled up, to get it out of the way, in heaps that almost rival in size the *mountains of California*. At the time of my trip, railroads were constructed for the purpose of carrying this refuse material wherever it was wanted for filling in for railroading and other work. But I suppose it will be many years before these "hills and mountains" are entirely removed out of the way. The fact that sweet clover will take root and grow, and get sustenance from the air on such miscellaneous soils as those taken out at a great depth in the ground, is an additional proof of the great worth that it may have in making the most unpromising soil productive. This reminds me that the growth of sweet clover in the suburbs of Toledo is this year just wonderful. When the farming community all get to understand the way in which this plant does "missionary work" in restoring poor soils, we shall recognize what a wonderful gift to agriculture is this luxuriant sweet clover that has been so many times called by thoughtless people a "noxious weed."

A. I. R.

PRICES ON HONEY FOR 1908; WILL THEY BE LOWER THAN LAST YEAR?

The flow of clover honey in the central-eastern States has been exceptionally heavy and of good quality; but this does not signify by any means that there has also been a great crop in other sections of the country. In some parts of New England the season has been good to poor. The same is true in parts of New York and Pennsylvania. In Ohio the flow has been remarkably good; and it has been fairly good in Michigan, Kentucky, Indiana, Illinois, and Wisconsin; in Iowa, fair to poor.

Some unfavorable reports come from Kansas and Nebraska. Missouri reports fair to good. In California the latest advices show generally a poor season except in the orange districts. Reports from Texas are a little more encouraging. Advices from Colorado are not as yet very definite as to what the season is to be.

We see no reason why the *general* market should take a slump; but the Chicago and New York markets, as well as those intervening, will probably have plenty of clover honey, and prices will necessarily be a trifle lower than last year. In Cleveland the buyers are very shy. They do not know what to offer. Along this line we quote from a private letter from one of the largest concerns in that city. As they had no knowledge that they were to be quoted we do not feel at liberty as yet to give their name.

We are not ready to make an offer on comb honey until we have further information from the section where we usually buy our honey. We are confident, however, that the price will be much lower than usual this season. The abundant fruit crop and general condition of the trade, which affects the line of luxuries most, are reasons for our thinking this, and the large crop of honey in Ohio, we are afraid, will prevent our selling much in sections where we have sold it before.

We wish to offer the suggestion that the large producers seek out markets where there have not been good crops, and *seek them early*. Be careful, also, to avoid a center that is being glutted. Do not, under any circumstances, send a large shipment without first making careful inquiries; and avoid sending to new houses.

It possibly may be advisable in some cases, with a well-known reliable house, to send on commission; but send only a small shipment at first; and it that goes well, try another one immediately.

GLEANINGS is always willing to co-operate to the end that bee-keepers may get the best prices obtainable; but it would be the height of folly for us to attempt to "bull" the market when the conditions would not support it; for any bee-keeper who waits for better prices will be likely to be disappointed in that he may have to accept less than his first offers. Along in September the market will become more stable, but not higher probably. The number of offerings at present is making the buyers somewhat cautious.

Later.—After writing the foregoing, the following from one of the best and most reliable commission houses in Chicago has been received. As this has a direct bearing on prices we are glad to give it right here:

Mr. Root:—The honey yield of this season is beginning to come on the market. At this writing the demand for it is limited, but we usually have a very good demand by the beginning of August. What sales are being made now are on a basis of 15 cents for fancy white comb. For lots of any size this would be shaded, say a cent or so per pound, although a determination not to accept lower prices is our purpose at this time, as we believe

the fine quality of the honey will create a demand for it that will pay this price. The consignments received up to this writing are most desirable, in that the sections are well filled, and the honey securely fastened to the same, giving promise that much of the honey will grade A No. 1 to fancy.

August and September are favorable months for transporting honey, as the wax is strong and there is seldom any of it broken in transit. Indeed, we think that, at this time of the year, honey shipped without being crated in carriers of six or eight cases comes quite as safely as that in the carriers.

The demand for extracted for family purposes is quite limited, and will be for a little while to come; meantime, clover is being sold from 7 to 8 cents per pound; amber, 5½ to 6½. The variation in price is caused by quality, flavor, and style of package. Beeswax sells freely at 30 cents per pound when clean and of fair color.

R. A. BURNETT & Co.

Chicago, Ill., July 22.

THE PICTURE ON THE COVER FOR THIS ISSUE.

Something like twelve or fifteen years ago I purchased a rhododendron of the Storrs & Harrison Co., of Painesville, Ohio. I think the plant cost \$1.50. It was about a foot and a half tall, and it was in full bloom when I received it. The rhododendron, or flowering evergreen, as it has been sometimes called, is a plant that can be shipped safely when in bloom, without injury. Yes, it is said that you can take a plant out of the garden and set it on the dinner-table, and plant it back in the garden again when in full bloom, without any setback. Perhaps this might be done with a small plant; but the one on the cover page is now taller than my head, as you will notice, and from five to six feet across. It has a beautiful round head of bright glossy evergreen leaves, and has stood safely the frosts of more than a dozen winters, and has always given us more or less bloom in the month of June. Each bunch of blossoms is nearly the size of my cap, as you will notice; and there were perhaps over a hundred trusses of bloom like the ones you see. The color is a beautiful pink; and inside of each flower there are pencillings as if a skillful artist had dipped his brush in some golden paint and dextrously touched the blossom here and there. I explained to the grandchildren that these pictures inside of the beautiful flowers are done by God's fingers. The glossy evergreen leaves roll up in the winter whenever the temperature is much below freezing. When the sun comes out they will unroll in a very few minutes. But when a freezing blast starts up suddenly they will curl up in about as short a time. I think this plant stands the weather best on the north side of the house. It then gets shade when the weather is very warm, and the sun is not so likely to start it early in the spring. I do not think I ever invested money in any flowering shrub that gave me more satisfaction than this one.

On either side of me you can get a glimpse of some blood-red Japanese maples. They too have passed through many winters without any protection; and their brilliant foliage, especially in the spring, when the new leaves are out, is as handsome as a beautiful flower; and it is a flower that is *always* in bloom. Of course the leaves drop off in winter, unlike the rhododendron, which always has foliage.

When I asked Ernest to give the readers of GLEANINGS a picture of that beautiful plant in full bloom I did not contemplate putting myself before you so prominently; but he said I needed to stand up among the flowers in order to give you a fair idea of the size of the trusses of bloom.

A. I. R.

GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

According to the best advices obtainable, the sugar crop of the world is short, due to the shrinkage of the Cuban output by 500,000 tons. Corn is also high, so that glucose production must be curtailed until the price of corn goes down. The honey crops of Texas and California are considerably short of an average.

The Texas Agricultural Experiment Station has just issued an excellent bulletin on the honey-plants of the State. It is largely the work of Louis Scholl, assisted by his brother, E. E. Scholl. Professors Mally, Newell, Sanderson, and Conradi also contributed. To the Texan bee-keepers it will prove valuable, as they can obtain the correct names of honey-plants by consulting it. To students of honey-bearing plants it must prove invaluable.

MORE LAND FOR SETTLERS.

Secretary Garfield has ordered opened for settlement 18,000 acres of land embraced in the Sun River irrigation project in Montana. This forms what is known as the Fort Shaw unit, which was withdrawn from entry while the canals were building. The terms are somewhat the same as for other irrigation projects built by the United States government. Practically Uncle Sam will give away 205 farms of first-class land. The money paid is simply for the construction of the waterworks. If you desire more information, apply to the Statistician, United States Reclamation Service, Washington, D. C.

PARCELS POST AND GROCERS.

At the recent convention of the National Grocers' Association a strongly worded resolution was passed against parcels post in any form. As no one has proposed sending groceries by mail except on rural routes it seems as if the grocers went out of their way to take a slap at the farmers. It would be well if more resolutions of this sort were passed, for the farmers would soon be in a position to know who are their friends and who are their enemies. The special agent of the express companies in the national Senate, Mr. Platt, will soon retire (at the end of the term), and ere long we shall know just who is against this great improvement in our mail service, as Senator Carter intends to force Congress either to reject or accept parcels post.

MAMMOTH CLOVER AS A SOIL-IMPROVER.

In Michigan there is what is known as the "jack-pine lands," which have proved until lately a sort of white elephant to all who essayed to work them. Experienced farmers with means tried their hand at the problem of soil improvement, always to meet with defeat. Recently it was discovered that mammoth clover would grow luxuriantly on these sandy lands, and this proved to be the key to the whole situation. Growing this clover for some time fits the soil for other

crops, so that all the farmer requires to make a fair start is a supply of mammoth-clover seed. Michigan has some 2,000,000 acres of such pine lands; Wisconsin an equal amount, and Minnesota even more, so that the value of the discovery is considerable. Bee-keepers will be pleased, as mammoth clover is a honey-plant of considerable value. The United States Department of Agriculture has recently issued a bulletin covering this subject. We think it is free.

A LESSON FOR BEE-KEEPERS.

The millers of the Northwest at their recent convention decided to spend \$100,000 in an active campaign in behalf of white flour. They say they were forced to do this by the oft-repeated assertion of the breakfast-food manufacturers and others that fine bolted wheat flour, when made into bread, produces stomach troubles, whereas there is no truth in such a statement. For years Americans have had it dinned into their ears that fine white flour is injurious, with the result that the sale of it has been seriously curtailed—at least the millers entertain that opinion. Bee-keepers can learn a valuable lesson from the millers as to the value of printers' ink. They can learn another—not to allow derogatory statements about honey to appear in the public prints. After a while people get to believe such statements to be true, and act accordingly. The net result is that the whole industry is hurt.

A NEW KIND OF WAX.

Newspaper reports from Southwest Texas proclaim the discovery of a kind of vegetable wax which can be extracted from a native desert plant known as candala, growing profusely on desert lands in Brewster and Terrell counties in very much the same manner as rubber is extracted from the guayula plant in the same region. A Mr. Willet, a mining engineer, claims the merit of the discovery, and has just secured a concession from the Governor of Texas allowing him to appropriate all the candala-plants he can get for five years. He proposes to erect extraction-works at Sanderson, Texas, and interest local capitalists in his enterprise. He claims there is not less than 100,000,000 tons of this shrub in sight in Southwest Texas. This is a rather high estimate, for candala is a small shrub, and grass or shrub of any kind is not very common in either Brewster Co. or Terrell. We shall await further developments with great interest.

BEEES IN CALIFORNIA.

Prof. Cook seems to feel rather "blue" about the prospects for successful bee-keeping in Southern California. There are good prospects ahead. Note the great Harriman project mentioned last issue; also the Yuma project now being constructed, and the Phoenix project, which will be finished next year. True, these last are not in California, but they are not far away. Date culture, alfalfa-growing, and citrus crops will be the main stays of the farmers there, very likely. If so, bee-keeping will be a safe industry, as all three are excellent nectar-bearers. Cotton-growing and cantaloupes will also favor bee-keeping should the ranchers find these crops profitable.

The United States Reclamation Service has on its slate a project for damming the Colorado River, for a great scheme costing \$40,000,000 at least. These plans, when carried out, will result in great good to the bee-keeping industry in the far Southwest.

NOTES FROM CANADA

By R. F. HOLTERMANN.

Oh for some easy method of getting a young laying queen into a hive to replace one which is failing! I have seen many methods advocated, but I am afraid I lack the courage or faith to put some of them into practice. Others entail too much work and loss.

We have been spending day after day examining stocks for queen-cells, noting the general condition, giving room, and doing the many things necessary in modern bee-keeping. The honey-flow has been good over almost all the province. There have been remarkable yields of honey; and yet in some sections, owing to dry weather, the flow has been poor. Many ask what prices will be, and I am pleased that I am not on the committee which is to recommend a price. There should be moderation both ways. The prices should be neither too high nor too low. First-class honey will be protected by a duty to a certain extent.

INFERIORITY OF BLACK BEES.

I never before was so thoroughly convinced of the inferiority of black bees. My Carniolans and even the Italians can keep a twelve-frame Langstroth brood-chamber well filled with brood; but the black queen generally occupies less and less room with brood; and where there is a long flow of white honey, and then a fall flow, the black colony is simply not in it at all, because of the lack of bees.

THE NEXT NATIONAL BEE CONVENTION TO BE THE BEST YET.

Because of the energy which Secretary W. Z. Hutchinson is displaying, the good honey-flow bee-keepers are securing, and the great help which individual members of the association might give to create an interest in the meeting, the coming National convention at Detroit should in reality prove to be the *best yet*. I know of quite a number of Canadians who expect to be there.

MOVING A CARLOAD OF BEES TO THE BASSWOODS.

We are just preparing to take a carload of bees to basswood at Long Point Island. Two years ago I took 240 colonies there at an outlay of about \$200, and received practically no return; but the enterprising bee-keeper must run such risks. The result may be very different. This season a 10,000-lb. return would not be any more remarkable than a failure.

When moving we screen the hives in front and not on top, and we water the bees frequently, so that they are moved with comfort to themselves and to us.

BEES NOT SO MUCH INCLINED TO ROB IN CLOUDY WEATHER.

We always have a number of students at our apiaries so that we have more or less of a school or college, and we discuss methods and reasons for action. We were speaking of robbing, and to a young man from Finland, Russia, who is with me for the season, I said that, other conditions being equal, bees do not start robbing as readily in cloudy weather as when the sun shines. In robbing-time I prefer a cloudy morning to a bright one; for when the sun shines brightly, robbing is more likely to occur. Another young man who has been with me for years endorsed this statement, and added that it was something which, so far as he knew, had not been mentioned in the bee-books and papers.

THE BUILDING OF WORKER-CELLS AN INDEX OF THE PRESENCE OF THE QUEEN.

How many beginners in bee-keeping there are who do not know that, when the bees build worker comb naturally, it is a sure sign of the presence of the queen, and that it settles at once the often difficult question as to whether the queen is with the bees or not! Another way, if one is doubtful as to the presence of a virgin queen, is to give the bees a comb of young unsealed brood; and if the bees are queenless they will start cells. Many a queen is destroyed in introduction because the bees have other means of securing a queen. Avoid giving the colony young brood; and if such must be left in the hive, examine the combs, and in about 36 hours break down any cells that may have been started.

THE ASPINWALL HIVE PUT TO A SEVERE TEST.

Some object to the Aspinwall hive because it is large and can not be readily carried about. Such men, in advancing that reason, are at least dangerously near the class that would object to a modern reaper because the old sickle can be carried about more readily. I have five Aspinwall hives in my apiary. On a certain day I gave instructions to a young man to make a special hive for some of the combs which were to be taken out of the brood-chamber and replaced by the slatted frames between the remaining combs. Owing to the end-spaces, the Aspinwall frames are not interchangeable with regular ones, and can not, therefore, be put into an ordinary hive. The young man neglected to do this, and the following week three of the five colonies had the swarming impulse. Of course, this is no reflection on the hive, as, without the slatted divisions, it was not really an Aspinwall hive. We then put in these slatted frames, or divisions, and actually broke up the swarming impulse in two out of the three. The third colony swarmed, owing to one cell being missed; but the bees returned after the cell was broken down; and this colony, too, is now free from the swarming impulse. This was a rather severe test, as the hive is supposed only to *prevent* the swarming impulse and not to cure it.

HOW MUCH SHALL HONEY BE THINNED FOR FEEDING BACK?

The same young man from Finland is making a careful study of the A B C and X Y Z of

Bee Culture; and when we had occasion to speak recently of feeding back honey to complete sections, he stated that the A B C advised using one part of honey to four or five parts of water, and that the cappings frequently looked water-soaked. I told him he must be mistaken — that the prescription should be reversed — one part of water to four or five parts of honey, I thought. He then produced the book. Surely, the editor's pen failed to put down his thought. Such things do happen; but it should not be allowed to appear in another edition. [This statement is a mistake, of course, and we acknowledge with thanks the correction. These figures had been marked for correction, but in some way the change failed to materialize, and the matter was then overlooked. But would simply reversing the figures make the statement entirely correct? We have found that one part of water to two parts of honey makes a mixture that is of about the consistency of raw nectar, and we should be afraid that one part of water to four or five parts of honey would give too thick a mixture. We should be glad to hear from any who may have had experience in feeding back. Let us be sure that the consistency is right.—Ed.]

CONVERSATIONS WITH DOOLITTLE

MANAGEMENT OF SUPERS.

"When working for section honey, when should I put on the supers?"

"There are a number of things to be taken into consideration in deciding when to put on supers, Mr. Robinson. In working for comb honey, the more we can keep all the bees in one colony, the better. In other words, the stronger the colony the better chances we have of success."

"But do not strong colonies tend to induce swarming?"

"Yes. But we can do much toward restraining the swarming tendency."

"I should like to know about that; for as soon as my colonies became strong in numbers last year then they began to swarm."

"How much entrance did you give them?"

"The same as they have the year around—probably one-half inch deep by four inches long. Would that be enough?"

"That would be all right for winter; but for summer the entrance should be the whole width of the hive, and from one inch to 1½ inches deep, so as to give abundant ventilation beneath the brood-frames."

"But how do you get this height of entrance? My entrances are only half an inch deep."

"Is your bottom-board nailed fast to the hive?"

"No."

"Then all you have to do is to take a piece of seven-eighths board, the same length as that of the hive from front to rear, and mark off one inch at one end and nothing at the other, sawing through so you will have a wedge-shaped piece as long as your hive. Now, with two such pieces to each hive you are prepared to ventilate easily any hive

by simply raising the front and slipping the points of the wedges in till the thick ends come even with the front of the hive. You now have an entrance 1½ inches deep by the width of the hive."

"Will that keep all colonies from swarming?"

"No; but it has a tendency that way. In addition to this you will need to shade the hive from the hot sun between the hours of 9 A.M. and 4 P.M.; and in this you will add another tendency toward overcoming the swarming of bees."

"But the man of whom I purchased my bees told me that they did better out in the open than they would do in the shade of trees."

"Well, I guess he was all right there; but the shade I advise will allow the sun in the morning and later in the afternoon to strike the hive. It is for the seven hours during the hottest part of the day that the shade is needed."

"How is that to be obtained? I use tin on the tops of my hives to prevent leaking, and I have noticed that this gets so hot on warm days when the sun is shining that I can not hold my hand on it."

"No wonder you were troubled with swarming, with that small entrance and the almost melting heat from the top of the hive. A shade-board should be made out of any old light lumber. The rear of this board should be about three inches from the top of the hive to allow the cool air to pass under it, and the "pitch" thus given will carry off all the water when it rains."

"How big should the board be?"

"I make mine ten inches wider than the tops of the hives, and six inches longer. This longer space comes entirely on the south side of the hive so as to shade the front and the entrance, while the other is divided equally. In this way the whole of the hive is shaded during the middle of the day."

"I see. I have gained another pointer. But we have said nothing about *when* to put on the supers."

"I know we have not, for I thought it better to touch the real trouble with you first."

"I supposed my trouble lay in not knowing just when to put the supers on. When should this be done?"

"When you have your entrances fixed and your hives shaded as we have been talking about, keep an eye on the bees and your field as regards the clover bloom. As soon as you see that the white-clover blossoms are opening, and on pleasant evenings there is quite a show of bees at the entrance of any hives, they standing there with fanning wings, you may know that the colonies where you see such bees are strong enough for a super, and that they will enter it as soon as nectar above the wants of the brood begins to come in from the clover. That is about the only way to tell from the outside of the hive. You will know a little better if you open the hive. If you see that any of the cells along the top-bars of the frames are being lengthened out with new white wax, and see honey sparkling in the cells, you should certainly have the supers on at once; for, failing here, you are apt to induce swarming on account of the honey crowding the brood, and the bees becoming crowded in their hives."

"You would use starters of foundation in every section in the super, I suppose?"

"In all but the center tier of sections in the supers. These should have baits in them."

"What do you mean by baits? Do you smear the foundation in these sections with honey?"

"No, not that. Nearly if not quite every one working for section honey has more or less sections in the fall of every year which are not filled full enough to be marketable. The bees are allowed to take the honey out of the combs in these sections, when they are placed in the center of the supers so that the bees find drawn comb in the first super put on, ready for them to store nectar in as soon as any comes in from the fields. And, beginning thus, they will at once begin work in the other sections immediately surrounding these, and thus the bees are *baited* into the sections before they would otherwise go."

"I see. But suppose I or any one else does not have such left-over sections."

"Not having any left-over baits, the next thing is to find, if possible, some pieces of white comb as large as your hand, and fit them in the sections. It will pay you to do this, even if it does make a little extra labor. Yea, more. I would have at least one section in the center of each super, or the super first put on, even if I had to use old black comb for that section, and four would be better still. And if we have the sections filled or partly filled with comb left over, 4 times 4, 16, is so much the better; and if we could have the first super on each hive filled entirely full of such sections containing combs all white and clean, left over from the year before, we could almost bid defiance to swarming if our hives were shaded during the middle of the day, and the wide-open entrances given. If the colony is strong, as soon as it commences sealing honey in these combs a second super of sections, all full of foundation, should be given; and thus early in the season, and under these conditions of keeping down swarming, this super should be put under the one the bees are already at work in, and a few days later put another super on top of both, which will almost insure no swarming of that colony."

Borodino, N. Y.

GENERAL CORRESPONDENCE

FOUNDATION FOR SECTIONS.

Split Sections vs. Hot-wax Methods; Perfect Filling Desirable; a Reply to Mr. Atwater.

BY J. E. HAND.

Mr. Atwater, page 151, says, "With the Hand method all sections must be rehandled," etc. He seems to lose sight of the fact that empty sections can be put into frames more rapidly than after they are filled with foundation.

Sections may be filled with foundation and put into frames at one operation by my method. The difference in the two methods is that, with my method, four sections are filled with one continuous sheet of foundation at a single operation

after they are half way in the frames, and with the usual methods the sections are treated one at a time, and the operation repeated if bottom starters are used. It is easy to see which is the most expeditious method. Again, while sections with swinging sheets of foundation must be handled with care, and kept right side up, frames filled with foundation will by my method stand any amount of rough handling, and may be piled up like cord-wood.

Mr. Atwater calls for proof that my method is the most rapid. I am no longer young, and my joints are somewhat stiffened by rheumatism; but I can fill sections by my method at the rate of 500 per hour, and I can't do more than half that many by any other method that I know of.

The fact that the split-section method is much more rapid than either the hot-plate or melted-wax plan is a very small item when compared with the quality of the work as shown by the finished product, which results in a higher per cent of strictly fancy sections; and it is the fancy article that brings the highest price.

The manner of putting in foundation has much to do with the perfect filling of sections, and perfect filling makes a difference of one to two cents per pound in the selling price.

Unless the foundation fills the section perfectly, there will be pop-holes in the corners, and these greatly detract from the appearance of the finished product, and it is the appearance that makes quick sales.

I can agree with all that Mr. Atwater and Dr. Miller say regarding sections filled with foundation, and fastened on all sides with melted wax. I do not consider such a method as practical, for reasons already given by these gentlemen, and which I have proven to my entire satisfaction.

These objections do not apply to the split section, in which the foundation, though held in position in the center of the section, whether the hive is level or not, is not really fastened to the wood at all until the bees fasten it, which is after the stretch has been taken out of it.

Thus the stretch is not confined to any one section, but is equalized between the four sections, which eliminates the sagging and warping nuisance which is so vividly illustrated in Fig. 2, p. 152. It is true that sections split on three sides were patented in England, likewise sections split on one side and also the whole length; but so far as I can learn I am the first to use the continuous sheet in sections split on three sides.*

Regarding the line of wax that shows on the sides and top of split sections, I am not a prophet, and can't say what may happen in the future; but I am not going to lie awake nights for fear people will think my honey is not the genuine article, especially since I have sold tons of fancy honey in split sections, and the only complaint has been that there was not enough to supply the increased demand.

In figuring the relative cost of putting founda-

* Referring to this, if Mr. Hand will refer to Samuel Simmins' "Modern Bee-farm," edition for 1893, page 91, and later editions, he will find that the author used long sheets of foundation without cutting, which he put in three of these split sections at one operation, the same as Mr. Hand. The only difference was that Mr. S. used three sections while Mr. H. used four. This is the language that Mr. Simmins used in the above reference: "My three-side cut sections can also be used, . . . the sheet of foundation being placed across the three sections without cutting."—ED.]

tion in sections by the different methods under discussion, H. H. Root, page 18, Jan. 1, seems to lose sight of the fact that the accurate cutting of the foundation required to make a perfect fit, which is so essential when using the full-sheet and hot-wax plan, will cost about the same as the splitting of the sections, and I can save half the cost of putting it into the sections by reducing the time fully that much.

Regarding the appearance of the split section, it is true that the edge of the foundation shows on three sides. However, that can not well be considered as an objection, since the line is perfectly straight and true, and the section, being protected by the wide frame, is perfectly white and unsoiled; and the thin stripe around the section only adds to the appearance by breaking up the monotony of a plain surface, and gives the section a finished appearance.

The ordinary section of honey produced in a T super or section-holder, with the top soiled and discolored by propolis, actually looks cheap beside the split section with its solid block of honey without any pop-holes.

The real value of the split section, and its superiority over every other method, can be determined only by a comparison of the finished product, which results in a higher percentage of perfectly filled sections than any other method. And even if it cost twice as much to fill sections with foundation by this method, the difference in the selling price of the honey would make it up many times over.

Birmingham, Ohio.

[Some of our subscribers have had a chance to test the propositions advanced in this discussion during the past season, and we should be pleased to hear from all such. Let us have the facts.—Ed.]

CARBON BISULPHIDE FOR FUMIGATING.

How to Apply; Is it Safe to Use Cyanide of Potassium?

BY J. L. BYER.

Prof. Surface's article, page 571, May 1, regarding the eradication of the bee-moth by means of cyanide of potassium was read with considerable interest. While every statement made by him is true, yet I can not refrain from entering a protest against the use of such a deadly drug when we have something else just as efficacious, and practically free from any danger attendant on its use.

In common with Prof. Surface, the writer has no use for sulphur for fumigating combs, as the fumes of that article always (even when the slightest quantity is inhaled) cause me to be very sick—nausea and violent headaches being the main symptoms. The "just as good" I have in mind is, of course, the comparatively well-known drug, carbon bisulphide. The only danger accompanying the use of this article in fumigating any thing is the certainty of an explosion, if the room where the gas is circulating is entered by any one bearing a light or fire in any form. Of course, this is a circumstance easily guarded against, as combs are pretty sure to be treated in

the honey-house or other out-building. Certainly no one would think of using the cyanide treatment too near the living-rooms.

Like the cyanide of potassium, the fumes of the evaporating carbon bisulphide will kill the bee-moth (or any other insect) in all stages, whether as egg, larva, pupa, or winged moth; and, in direct contrast with the cyanide of potassium, the carbon-bisulphide treatment is so simple and so free from danger that the veriest novice can use it as effectually as a veteran. All that is necessary is to have a close room (or, better, a close box), size dependent on the number of combs to be treated. While it is not absolutely necessary that the receptacles be air-tight, yet the nearer that condition the less of the drug required.

On top of the combs (the fumes are heavier than air; hence go downward) pour a few ounces of the drug in an open dish, and the job is done. At two of my yards the fall flow is so light that we often remove supers at the close of the clover-flow, and allow what little honey that comes in afterward to go into the large brood-nests. These super combs, as well as any empty brood-combs that are on hand, are packed close together in large boxes holding over 300 frames of Quinby dimensions in each box. These boxes are made of matched lumber with close-fitting top of the same material. When the box is full of combs a common saucer is placed on top of the combs at each end of the box, the two saucers filled with the carbon bisulphide, box closed, and the combs are good for all time so far as moths are concerned.

In the summer of 1906 one of these large boxes was filled with over 300 combs in August at the Cashel apiary. At the time we had no carbon bisulphide on hand; and when we made our next visit to the yard we found that the small grubs were already quite numerous; and wherever the combs touched together the fine webs were much in evidence.

As explained before, two saucers of the carbon bisulphide were put on top of the combs, and the box closed. Two weeks afterward the box was looked into, and every moth larva was as black as a coal, and the combs were never looked at again till the following June, when not a particle of damage was found, barring the little injury that had been done previous to the carbon-bisulphide treatment.

I have had no experience with fumigating comb honey, and hence I could not say whether the gas would discolor the cappings or not; however, from absence of any after-effects on combs I am inclined to think that no damage would be done.

THE COST OF THE BISULPHIDE.

Just a word as to the cost of the carbon bisulphide. There is no question but that the cost of production of this drug is very low; but for the first few years of our experience our local druggist taxed us five cents per ounce. A friend knowing something of the drug trade "made me wise," and since then the same druggist now charges me 25 cents a pound.

At my three yards I usually use about one pound, so you see the cost is not worth mentioning.

I might yet say that, if no box is handy, small quantities of comb can be made temporarily free from the moth if the combs are in fairly well-

made supers piled one on top of the other. On top of the upper super place some carbon bisulphide, and then cover quite closely.

With all due respect for Prof. Surface, we would repeat that, in our judgment, the use of such a deadly thing as hydrocyanic-acid gas should not be recommended when we have a substitute just as good, and practically free from any danger attendant on its use.

HIVE-CLOTHS.

A Practical Plan for Those Who Wish to Use Cloths Under the Hive-covers.

BY WM. MUTH-RASMUSSEN.

Occasionally I see in my bee-papers some allusion to this subject, and, according to the old adage, "Many men of many minds," some bee-keepers must have cloths under the hive-covers, while others would not use them at any price. The Dadants have used home-made mats; A. I. Root at one time recommended enameled cloth, and other materials have been tried; but the material which is probably most commonly in use, and most easily obtainable, is burlap or gunny-sacking. When I lived in Southern California, some 30 years ago, it used to be a common saying that gunny sacks and baling-rope were legal tender among the bee-men. The baling-rope was used around hives when moving them, and for tying branches of sycamore-trees on a permanent framework to shade the hives during the summer.

Being one of those who must have a cloth under the hive-cover, I was naturally always on the lookout for the best material for this purpose; but for many years I found nothing better than gunny sacking. This, however, was very unsatisfactory, as the bees would gnaw holes in it, and the cloths had to be discarded and replaced by new ones every few years. Finally I read in the printed report of the National Bee-keepers' Convention, held in Los Angeles in 1903, that Mr. J. F. McIntyre used painted hive-cloths. It was not long before I started a correspondence with him, and, through his kindness in furnishing me with the desired information, as well as by my own practical experience with them, I am now enabled to give complete directions for making such cloths, which, I feel sure, will prove a boon to all who use cloths under the hive-covers.

MATERIAL.

I find that white duck is the best for the cloth; 8-oz. duck may do. As I could not get this here, I used a heavier quality. Mr. McIntyre prefers 6-oz. drill as being a little smoother. I tried sheeting, but found this too limber, and too easily pulled out of shape. I procured the duck, twice as wide as required, for my cloths, and then split the whole bolt lengthwise in the middle into two equal strips.

SOAKING.

One of these strips was then placed in an empty washtub by laying the cloth down zigzag fashion, so that it could be gradually drawn out without disturbing the underlying folds. After weighting the cloth down with stones, the tub

was filled with water and left thus over night. As the cloth will absorb a great deal of water it will not suffice merely to cover it, as then the top folds might be found high and dry the next morning. There should be plenty of water and to spare. The object of soaking the duck is to keep the oil out of the cloth, as the oil, according to Mr. McIntyre, will rot cotton fiber. The soaking will shrink the cloth, particularly in the direction of the warp, so that, in buying material for a given number of hive-cloths, one has to make allowance for the shrinkage. I found that the 11-oz. duck, which I used, shrunk half an inch to the foot lengthwise.

PAINTING.

The next morning the paint is prepared by mixing yellow ochre with boiled linseed oil in the proportion of equal parts by weight. After splitting the bolt, each strip of the cloth was about 20 inches wide, and it required 4 oz. of ochre and the same of oil to give each yard in length two coats. The paint should be stirred frequently while being applied, otherwise much of the ochre will settle to the bottom.

A low table is now arranged close to and with one end toward the tub by tacking a couple of foot-wide boards side by side on two trestles or saw-horses. These boards may be of any convenient length, say 8 or 10 feet. Rough boards are better than planed ones, as the wet cloth does not adhere so tenaciously to a rough surface.

When every thing is in readiness, the stones are taken out of the tub and the water poured off. If this is not done, pools of water will collect on the surface of the cloth and interfere with the painting. The cloth is now drawn out on the table until it reaches the further end, and the whole strip, as far as it covers the table, is given a coat of paint, leaving, however, about 2 inches of the end of the cloth unpainted, so that one can take hold of this to pull the cloth by without getting the fingers into the paint every time. The paint should be put on middling thick with a good wide brush, care being taken that no spot is left unpainted, as the bees will bite holes in the cloth if they can get to the fiber. When one table-length is painted, the cloth is pulled out on the grass or on smooth clean ground, and another table-length gone over in the same way, and so on until the whole strip of cloth has received a coat of paint. If the cloth adheres too much to the table while pulling it, slip a round stick, as a curtain-roller, between the cloth and the table, moving the stick toward the tub and leaving it on that end of the table, when the cloth will move along with the stick rolling under it without any difficulty. The painting should be done on a warm, bright, and calm day, so that the paint may dry quickly and the cloth not be flapped round by the wind. As the corners of the cloth have a tendency to curl up while drying, I put a stone on each corner. In two days, according to the weather, the paint will be dry, and a second coat is given—this time, however, without wetting the cloth. When dry again, the cloth may be drawn up on the table or laid on a smooth floor, and cross-cut into pieces of the right size for hive-cloths. If these are not put to immediate use they may be piled up and covered with a hive-cover with a weight on top. This will keep them flat and in good shape until wanted.

USE.

The cloth should be put on the hive with the painted side down. When it is removed during manipulation of the frames, do not lay the painted side on the ground, as it may be more or less gummy with bee-glue, and pick up sand and trash. If the sun is likely to shine on the cloth, while off the hive, the better way is to fold it with the painted side in. The painted surface gets very hot when the sun is shining on it. If the painted surface becomes too much covered with bee-glue or burr-combs it can be scraped off, while quite warm, after exposing it to the hot rays of the sun.

COST.

I figured that the material (cloth and paint) cost me about 10 cts. for each hive-cloth. In this out-of-the-way place every thing (except honey) is expensive. In more favored localities they would probably cost less. I used to pay 5 cents apiece for second-hand gunny-sacks; and as each sack would make only two hive-cloths, with some waste, the old cloths cost me 2½ cents each; but, as stated above, they had to be replaced every year or two. The painted cloths appear to be good for many years to come, and will, therefore, be cheaper in the end.

They are quite flexible, and do not crack; yet they are stiff enough to remain flat and smooth when peeled off from the hive. They are airtight and water-proof, so that, even if the cover should happen to leak, the water will not soak through the cloth. I have now used 250 or more of these hive-cloths for three years, and I have yet to find the first hole made in any of them by the bees. I did, however, find one case where a colony had died out; and, as it was not discovered for some time, the moth-worms took possession and made several small holes in the cloth, biting through from the painted side.

In conclusion let me say that I am very much pleased with the change from the old to the new style of hive-cloths, and I owe Mr. McIntyre a debt of gratitude for putting me on the right track in this regard. I hope that others may try it and be likewise benefited.

Independence, Cal.

ALSIKE CLOVER.

Profitable for the Farmer and for the Bee-keeper.

BY ADAM LEISTER.

[The writer of the following article, Mr. Adam Leister, is one of our neighbor farmer bee-keepers who makes a success both with his farm and his bees. In talking with him the other day as to why so many farmers were putting in alsike in place of the ordinary red clover he made some statements which he kindly consented to put in the form of an article. As he is posted as to all of the latest developments of both branches of his business, and a close observer as well, his article should merit a careful reading, especially by the farmer class of our readers.—ED.]

For several years the high price of the common or red clover, together with the uncertainty of a catch, has set farmers to thinking about some substitute. Alsike clover, with its pink-and-white blossoms, is covering vast fields to-day that would otherwise be barren. I have read

much about "clover-sick soil," and I have sown red clover for 35 years, and have closely observed the time for sowing, with all conditions bearing on this part of the program. At times my sense of reasoning utterly came to a standstill as to *why* the catch is not better.

The observing eye has noticed the spontaneous growth of alsike along roadsides and wet places where red clover is apt to winter-kill. The meager catches of the red clover, with its high price of late years, have unconsciously driven the farmer to the sowing of alsike clover.

As a milk-producer I consider alsike fully equal to red clover. Sheep thrive on it, and eat it with the greatest of relish. The bees have filled their hives this season much earlier than usual, for they have worked on the alsike, which is much earlier, more vigorous, and larger, than the white clover, and produced a very desirable grade of honey. Alsike clover certainly ought to receive one page in the seed catalogs. When mixed with red clover it makes a perfect stand. It is highly profitable for pasture, as it makes excellent hay for all kinds of stock; and last, but not least, it has a value for honey that is surpassed by no other clover. We welcome its presence, and look upon it as the most profitable crop that the farmer can grow when its honey value is considered.

Medina, O., July 6.

CURING CLOVER AND ALFALFA.

Wallaces' Farmer makes a good distinction when it says that the moisture in the stalk can not be easily taken out if the leaves are turned to a crisp, as they will be if the hay is dried in the hot sun.

We must learn more about this business of properly curing clover and alfalfa. First, that we may put it in the mow in the highest nutritive state. That is very important; for if we are wise we shall want our cows to derive the largest benefit they can from the hay.

Second, we must guard against the ever imminent danger of spontaneous combustion or spoiling from over-heating in the mow. To put clover or alfalfa in the mow so if will be safe, and come out in fine color and highest nutritive value, ought to be the purpose of every good farmer. Too many men are simply anxious to rush the stuff in without regard to these other more important matters. We have never yet found a way of curing clover or alfalfa that will encompass these ends except by curing it in the cock and under hay-caps.

Now, if the clover or alfalfa is put into the cock as soon as it is fairly wilted, the moisture of the stalk is evaporated through the leaves, the natural way, and all the juices and flavors are retained and moisture dried by the fermentive heat rather than the burning rays of the sun. In this way the hay is cured rather than dried, and the nutritive value is best preserved. Not only this, but the leaves themselves, the most valuable part of the hay, are preserved. Cure clover and alfalfa in the cock with the addition of the hay-cap, and if cut at the right time the process is complete.—*Hoard's Dairyman*.

DR. C. C. MILLER.

"The Smile that Won't Come Off."

BY E. R. ROOT.

Most of the time I write under the editorial *ave*, for, although nearly all the matter signed "Ed." is by me, I often reflect the opinions of my associates on the staff; but in this case I prefer to adopt the first personal pronoun, for I do not know how I could speak of a very good friend and valued correspondent disguised under the editorial cloak.

I am very glad to introduce Dr. C. C. Miller just as he looks at bee conventions, for most of the time he has a half-smile on his face, for that seems to betoken the geniality that runs all through the man.

Some years ago—yes, nearly twenty—I said to Dr. Miller, "You have a peculiar talent for making bright comments in convention, throwing in a few sentences and then sitting down. These comments always enliven the proceedings. Now, can you not edit a department for GLEANINGS made up of short items of running comment, something after the style of your convention work?"

Turning to me he said, his wonted smile vanishing for the moment into a serious expression, "Ernest, I doubt my ability to carry out your ideas, but I have confidence in your opinion. I will try it. If you do not like the stuff, throw it into the waste basket."

There, now you have the origin of Stray Straws. We had a department running, as we do now, called "Heads of Grain," and I suggested "Kernels of Wheat" as an appropriate heading; but Dr. Miller very modestly preferred Stray Straws, as he was not sure that he would be able to glean very much *wheat*. As to the general character of the Straws, and whether they are worth binding along with the other gleanings from many fields, I don't need to say. Our readers have long since settled that by the eager way they grab at the Straw-stack in Marengo.

Dr. C. C. Miller is probably one of the best-known apicultural writers in the world. He reads both the American and European exchanges, and his articles and comments on both sides of the Atlantic have brought him into prominence throughout all beedom.

His writings are further enhanced by a ripe experience of many years, for he is now in his 78th year, having been for forty years a bee-keeper, and a good one, especially in the production of comb honey; and, if I mistake not, his crops are sold before they are off the hive. This speaks volumes, not only for his method of management but for his careful honest grading, which is all done by the members of his family. The buyers know in advance just exactly what Dr. Miller's honey is going to be, and they are usually willing to pay above the market because they know beyond any question that there will be no after-quibble over the grading, quantity, or quality. There is no reason why many others can not sell their crop in the same way.

You may wonder why I have felt inclined to put in a picture of our correspondent at this par-

ticular time. Well, I have had intimations that our good doctor was not going to be able to keep up the fast pace which he has maintained all his life; and the thought came to me that possibly we might, not very many years hence, miss some of those writings which are so generally labeled with smiles.

Too often we pay tribute after our friends are gone, and just as often regret that we did not bestow some mead of praise while they were with us, especially if they are of the kind that can't be spoiled. For that reason I felt inclined to present the "smiling picture" which his family and all of us know is so natural—not because we see a smile, but because we know there is something *within* that makes a "smile that won't come off." What a happy world this would be if we all had that smile!

Dr. C. C. Miller has long since ceased to think of the dollars. All he seems to care for is enough to provide for himself and family. For many years his sole thought has seemed to be, "How can I help to make the world happier and better?" He is an active worker in the church and Sunday-school; but of late he has been admonished by his physician to let some of those outside things go. He is beginning to husband his energies; but, as any one can see who follows his writings, he makes a constant effort to bring the name of his Master before the world.

When I sat down to write this sketch I did not have in mind the writing of a biography or an obituary. I intended to dictate only a brief note expressing what I believe to be the real sentiment of our readers, if I may judge of what I see in the writings of our correspondents.

We sincerely hope that the doctor will have strength enough to attend the National convention at Detroit, for I doubt not there are many who would like to see a real "smile that won't come off," and many others who would like to get hold of his hand and shake it, and tell the owner of it how much they love him.

BOTTOM STARTERS.**Do Bees Build on Them First?**

BY R. L. HALE.

You wonder, Mr. Editor, whether it is not unusual for bees to build on the bottom starter first, when such is used, page 643, May 15. Last season we used on half of our colonies a $\frac{3}{8}$ -inch bottom starter, and over half of them were built at the bottom first, some not at the top at all. Of course, we had no honey-flow. But I find it the case always in the fall at the close of the honey-flow.

In the repeated discussion as to whether or not it pays to use a bottom starter, I will give the plan which I have used with half of my bees for four years, and altogether this season. I use a three-inch starter at the top. At the bottom I take a top starter and fasten it with a hot plate, and then hold it firmly in place and cut it off with the wax-plate, thus leaving a starter of about $\frac{1}{8}$ inch. I never have a crooked section from the fault of the starter.

DR. C. C. MILLER.

THE CHICAGO DRAINAGE CANAL, SHOWING THE BRIDGE AT ROMEO, ILLINOIS, AND THE BANKS, ON WHICH SWEET CLOVER IS MAKING GREAT HEADWAY.

SWEET CLOVER.

How this Honey-producing Plant Grows on the Banks of the Chicago Drainage Canal.

BY J. L. GRAFF.

Sweet clover, of the white variety, is found growing in such profusion on the towering banks of the Chicago drainage canal, between Chicago and Joliet, that apiarists are much encouraged in their attempts to produce honey in paying quantities.

Before this great sanitary canal was built, a large amount of wild clover grew in the Des Plaines Valley. It all but covered the right of way of the railroads traversing the region, and spread out to a wide expanse of prairie land. When the constructing gangs with their ponderous machinery of all kinds moved down the valley, digging out the earth and stone, and piling it mountain high on one side or the other, much of the clover growth was dug out or covered up.

Within the last few years, however, it has been noticed that the clover began appearing on the rough banks until at this time there are hundreds of acres of it. When the bloom comes, the bees get busy, and, as may be conjectured, they lay in a rich store of as fine a product as may be found in any milk-and-honey land in the world.

The accompanying pictures were made at Romeo, Illinois, and near the home of John J. Keig, a poultry-honey man. He breeds and raises Buff Plymouth Rocks, and also owns ten colo-

nies of bees, from the work of which he recently sold 500 pounds of honey. Other property owners in the valley keep bees that find the rich bloom on the canal banks and in the adjacent territory. Quite recently the drainage board had its attention called to the increase in the clover acreage within the sanitary district, which by this time embraces 260 square miles of territory, and no one at this time is able to say that the great corporation may not turn to producing honey within a bailiwick in which by this time it has expended \$53,000,000.

Ravenswood, Ill.

THE TROUBLES OF AN AMATEUR BEE-KEEPER.

Moving Day.

BY F. DUNDAS TODD.

A Danzenbaker hive requires little preparation for moving, as all the frames are firmly held in position. In the day time I fastened all the bottom-boards and supers to the hives with staples, then I nailed on top of each super three pieces of wood, straight on the one side but curved on the other. They were roughly shaped with a hatchet out of inch boards two inches wide. Over these I placed mosquito-wire netting, the pieces being large enough to overlap by a couple of inches all round. The margins were bent on the sides of the hives, and held in place by strips of quarter-inch wood fastened with finishing nails. The purpose of this covering was to give the bees

plenty of clustering room and especially plenty of ventilation. The cover was placed over all; and, being well above the edges of the hive, tended to cool off the bees during the night, which I felt would be a good thing, as the bees would probably be less inclined to hang out as they had been doing.

Bee-day in my yard was generally Sunday, and it was no unusual thing for two dozen of my neighbors and their children to be grouped round the hives watching with keen interest the various manipulations. The farewell scene, however, occurred on a Saturday forenoon, and so my gallery was limited to a circle of ladies; but they were treated to an unrehearsed performance that was more than funny. My boy, as usual, occupied the role of general assistant, and in such hot weather his raiment was as scanty as the laws of Illinois allowed. Notwithstanding frequent past experiences he always forgot to tie the bottom of his trousers; and since he wore no underwear, any stray bee that wandered above the region of his shoes had a splendid opportunity for quick business. Again and again I would admonish him, reiterating the rule about bees always crawling upward.

On this occasion we were very busy, and I was astounded to see him limp gingerly to the back porch, where he dropped on to the top step, leaned his back against the wall, and stuck his feet over the top railing. The position looked both uncomfortable and peculiar, so all the grown folks gathered round him to learn the cause of his trouble. We found him carefully holding up the slack of his trousers just above the knee, and after repeated questioning he sadly informed us that at least three bees were roaming at large in the domain of his nether garments; that he was

afraid they would sting, and he wished they would, just to get the anxiety off his mind. But why this attitude? Bees crawled up, surely we knew that; and since they had ventured as far in one direction as he wanted, he was reversing himself so that they could start the return journey; but if his feelings were any indication they were now pursuing a downward career, that was the same as upward to him. I proposed to kill each one with a swift slap above the cloth; but, no! he was sure the dying wretches would sting, and it was his leg, not mine. The good matrons gave their best advice, but this was no ordinary infantile ailment, so we awaited developments and all joined in a hearty chorus as three separate and well-defined exclamations passed his lips, each indicating a lessening of his anticipatory pains, but decided augmentation of his physical sufferings. In due course he fastened all slack material round his ankles, and returned to his labors. But even now you can not convince him that bees *always* crawl upward.

My son and I were up at four next morning. We found hundreds of bees hanging outside; but the smoker drove many in. In front of each entrance we fastened wire netting with strips of wood. We figured we could do all that was to be done at this stage in about 15 minutes; but one thing after another lengthened out the time to over an hour and a half. The wagon was pulled close to the hives; but as many bees were flying I told the driver to take his horse about a block away. Once loaded, my boy and I pulled the wagon about fifty feet at a time and proceeded to kill as many of the flying bees as we could, as we feared an attack on the horse might precipitate a runaway.

Just before starting I sprinkled all the hives

HIGH BANK OF THE CHICAGO DRAINAGE CANAL, SHOWING VEGETATION, MUCH OF WHICH IS WHITE SWEET CLOVER.

SHEPARD'S APIARY OF HOME-MADE HIVES.

with water from a watering-pan so they should not want for water; and, besides, it would tend to keep them cool. Of course, they were now clustered under the netting, and reminded me greatly of a big-sized box of black currants.

The day proved to be a very hot one; but I shaded the bees as much as possible and sprinkled them with water every half-hour or so. The trip of eleven miles took nearly four hours. The driver was a colored boy, evidently very fond of a horse, and on my hinting we might go a little faster he confided that the steed was "powerful slow," but if we gave it time it would surely get there. For about an hour before we arrived, we were threatened with a terrific thunderstorm, and I felt very anxious, as we were far from shelter most of the time. However, the storm circled round us and happily kept off until about an hour after we had placed the hives in their new location.

It took but a little while to place the stands, unload the hives, remove the netting, and make every thing shipshape. To make the bees take full notice, smoke was freely used, and boards placed in front of the entrances.

Next afternoon the purchaser called me up on the telephone to tell me the best hive had swarmed, and wondering "what in thunder" he should do about it. This was a proposition he had not bargained for. I told him what to do, and I heard no more about these hives until months afterward.

All bee-keepers know that 1907 was a poor season generally; yet these hives gave my successor, after July 17, 210 sections of honey, and in

addition four swarms. The news came to me from my friendly rival in a free confession that again I had bested him, he having secured 127 sections as against my total of 222 with 45 pounds of chunk honey extra.

Again the student with the Danzenbaker had whipped the practical man with the Dovetailed hive. Query: Wherein lay the secret of success?

And so, you will think, here ended all my troubles with bees. As a matter of fact, I had for the moment lost my pleasure, but I carried westward to the Pacific coast one incessant thought—why did these three hives develop so unevenly in the spring, and so unexpectedly? No, I had a fine lot of bees, both at the beginning of winter and the end, with an extra large quantity of stores. "With millions in the house," why did it not easily outstrip the other two? No. 2 was the weaker of last year's new hives, but laid in plenty of sugar stores, though not nearly as much as did No. 1. No. 3 was in fine shape so far as bees were concerned, but did not take down any thing like a sufficient quantity of sugar and water food. I was not surprised that it lagged in the breeding-up race in the spring; but the other two got on my mind, and so day and night I cogitated over the facts from as many angles as I could, but always without a satisfactory answer. Mr. Alexander, in one of his luminous articles in *GLEANINGS*, brought relief to my tormented mind. Hive No. 1 was honey-bound—that is, it was so "chuck full" of stores that the queen could not find enough empty cells in which to lay eggs. The remedy, had I known it, was to use the extractor. Benton, in his book, recom-

mends the same procedure; but though I had read his advice many times last season, I never suspected the principle was applicable to my own case. The best way to open one's eyes is from the rear; then we can see with the mind as well as the brain.

Hive No. 2 had sufficient stores and plenty of cell room for the queen, and therefore came along at a gallop. It exemplified the beauties of the happy medium, the too often unattainable balance of conflicting conditions. No. 3 was strong in bees but weak in stores, so "played safely."

I am free to admit that possibly—nay, probably—my solution is all wrong; but at any rate I have a working theory to guide me in spring manipulation—something I never had before, and I have always found a wrong theory more useful than no theory at all. With a theory one is always watching facts closely to see how they square with it; without a theory, one pays little heed, and soon forgets. So, thank goodness, I am in possession of a theory, but I am perfectly willing to discard it for one that looks better. Anyhow, this spring I will note carefully the ratio between the honey supply on hand and the cells available for egg-laying by the queen, so that I may learn what constitutes the ideal balance, for such must exist. I will take care that my bees have "millions of honey," but not necessarily "all in the house." A reserve store in the barn may probably be better.

Medford, Oregon.

THE BRITT APIARY, JACKSONVILLE, OREGON.

BY F. DUNDAS TODD.

In the early fifties, when Southern Oregon was attaining notice as a mining camp, there settled in its most important town at that date, a young

Swiss photographer by the name of Britt. He attained both fame and financial success in his calling, dying only a couple of years ago. But he is better remembered as the maker of the Britt place which is one of the show places in this part of the State.

True to his blood he chose a barren knoll for his home, and then proceeded by the liberal use of natural taste, brains, and water to convert it into a wonderful garden in which not one square foot of ground is unproductive. Forty years ago he added bees, and until the day of his death he was never without a fair-sized apiary. It is now managed by his son, who has about 40 hives of hybrids, about the only kind possible in this part of the world at this time where there are many keepers of bees but no bee-keepers.

Medford, Oregon.

HOME-MADE HIVES AND COVERS.

Big Honey Yield from Alsike Clover.

BY A. D. SHEPARD.

The hives shown in the engraving are home-made with the exception of the inside furnishings, which came from the factory. The most of the extracting-supers are also the "saw-and-hammer" brand, but they are not satisfactory, for they do not hold their shape. They get out of square, and warp away from the end pieces, making openings that invite robbers. My preference for home-made hives is to halve the ends and sides, and nail each way, which makes a strong corner.

The covers are patterned after the regular metal covers, except that, instead of simply three strips across the top, this rim is covered with wood, and on top of this is the metal cover. The heat of the sun does not strike through this as it does through the galvanized iron alone.

THE BRITT APIARY, JACKSONVILLE, OREGON, THE OLDEST IN SOUTHERN OREGON.

A HOT DAY IN JULY.

A super-cover is used with this metal cover. I nail strips $\frac{3}{8} \times \frac{1}{2}$ inch on one side of this super-cover, forming a tray in which I place several pieces of felt paper (such as is used under carpets), and tack one piece on the under side, as I use cloths or quilts over the frames. This cover makes a good heat-retainer, and helps to ward off the direct rays of the sun.

My home yard of 75 colonies springd badly in 1907. Several died, and I doubled up, somewhat after Mr. Alexander's plan, so that I had 35 colonies for the harvest. I took 3000 lbs. from them. A nice piece of alsike helped "a heap," giving me a crop of 5000 lbs.

I did all the work alone, except the help of a man six days during extracting.

River Falls, Wisconsin.

BEEES CLUSTERING OUT ON THE FRONTS OF THE HIVES.

Work Suspended Because of a Crowded Condition

BY E. BRITT.

On a hot day in July, 1906, when the thermometer reached the exceptional point of 104° in the shade, my bees were clustering on the fronts of the hives as shown in the engraving. I thought the heat alone was the cause; but upon investigation I found that the supers were crammed full of honey, and in two instances the bees were building comb on the outside. I keep from 30 to 50 stands, and it has never been necessary to feed or to provide any protection during winter. I have never had a failure of a honey crop. The hives are placed above the ground to keep the treads from meddling.

Jacksonville, Oregon.

[You do not say whether these bees swarmed under the conditions shown and described. If they did not, their non-swarmer tendencies ought to be encouraged. No wonder they clustered; and when they were compelled to build combs on the outside for want of room the wonder is they didn't swarm too. Perhaps they did.—Ed.]

THIRTY YEARS OF EXTRACTED-HONEY PRODUCTION.

BY GEO. W. MORRIS.

My apiary is run almost exclusively for extracted honey. In 1906 I took 4800 lbs.; in 1907, 7500 lbs. I realized \$1100 for the two crops, besides using about 1000 lbs. at home in the two years. Since I embarked in the bee business, thirty years ago, there have been at least ten years when I got no surplus honey, and even had to feed in some years. I am trying the divisible-brood-chamber hive this season. I believe in large hives, young and prolific queens, good management, and eternal vigilance in order to succeed.

I have had to do about all the work in the apiary myself, as my only son is afraid of bees, although he makes a good hand at the extractor. He can uncup and extract as fast as I can bring in and return combs to the hives. The most we ever took in one day was 600 lbs.

The cart shown in the engraving in front of the building is used to haul the honey to the extracting-room, and it is a very handy vehicle to have about the yard.

Cornishville, Ky.

[A good hand-cart in a bee-yard where the ground is reasonably level is a great labor-saver. If the ground is uneven, a wheelbarrow is better.—Ed.]

THE PROPER CARE OF EXTRACT- ING-COMBS.

Does it Pay to Give the Bees Wet Combs? Feeding Colonies for Winter; Thick Sugar Syrup Recommended.

BY E. D. TOWNSEND.

I formerly practiced spacing our combs after the last extracting, and criss-crossing them out of doors for the bees to clean up, as this was the way some advised. In some cases a part of the combs would not be cleaned by the bees as usual. When these were given to the bees to be filled the next season, we never could see any difference in the quality of the honey, whether the combs were cleaned or not. Some of the honey left in the combs candies, while the rest apparently disappears; at any rate, none shows up in the honey at extracting time. I take the precaution to give combs, from which dark honey had been extracted, to the bees, before the season opens, as I have explained heretofore. I used to think I was doing the bees a favor by giving them these wet combs to clean outdoors; but now I'm very sure it is an actual damage to them rather than a help; for with their mad scramble for the honey, they use up valuable vitality, and this, too, at a vital time late in the season, when all their strength is needed to carry them through the winter. Then I would rather have the honey left in the combs than have that dirty purging smeared over the stories and frames. The bees are so eager for the honey that they overload, thus causing them to purge before taking wing.

Upper stories set back on the hives are cleaned all right; but the honey is stored right back in the same combs, so this method is a failure.

Toward the end of summer, or in this location early in September, bees begin to curtail brood-rearing. When this is going on, and as the

brood-nest begins to grow smaller and smaller each day, instinct teaches the bees that a period of rest is in store for them. At this time they manage the interior of their hive as if they had full knowledge of the rigorous winter that is in store for them, for, as the brood hatches out for the last time in the fall, they busy themselves carrying honey from the outside combs and filling in those cells made vacant by the hatching of the bees. This carrying-in process of honey from the outside combs is continued until there is as much as ten pounds of honey placed in these empty cells in the middle of the brood-nest. If the honey in these outside combs is of good quality, all is well; but if it is of an inferior quality, and the colony does not winter perfectly, there is likely to be trouble.

Knowing of these conditions, and of the instinct of the bees, we take advantage of this period to feed all colonies that are short of honey for winter stores. If the honey in these outside combs is of an inferior quality we have fine results by feeding every colony ten pounds of sugar syrup. After the last extracting, the yard is gone over and the colonies "hefted" to see if they have stores enough to last them until the main honey-flow of the next June. Any colonies falling short of 25 lbs. are marked "short," and the amount of stores necessary to bring the weight up to 30 lbs. is marked on the hives. In estimating the amount of stores needed, but few colonies are looked into—just enough colonies are looked into to get the run of how they are as to amount of stores. Colonies with very old combs are much heavier than new swarms; and taking this into consideration it does not take long to get on to the knack of estimating very correctly, since all the new colonies are marked.

Knowing the amount of stores needed, it is best to buy 15 to 20 per cent less of granulated cane sugar than the amount that is to be fed. The

APIARY OF GEO. W. MORRIS, IN CORNISHVILLE, KY.

thicker we can make the syrup, and get the bees to take it, the less sugar it will take to make up the shortage. While bees will take a sugar syrup thicker than three parts of sugar to two of water, we have had rather better results with this portion of each. This makes a syrup that weighs in the neighborhood of 11 lbs. to the gallon; and as good honey weighs 12 lbs. to the gallon, there is but one pound of moisture to the gallon for the bees to evaporate. Of course, there are other losses, so if the colony needs 20 lbs. of stores, more than they already have (10 lbs.), they should be fed 25 lbs. of the syrup. This would put it in good shape, and it would not need looking after again, in regard to stores, until the white-honey flow the next June.

In making syrup of granulated sugar we use a boiler large enough to cover the whole top of the stove. This is made of galvanized iron, and is what we use to melt four 60-lb. cans of honey at a time. A wash-boiler might do, but would not be so fast. We weigh in the water; then, as the water comes to a boil, add the sugar, keeping the contents of the boiler well stirred, after the sugar is added, to prevent it from burning to the bottom. As soon as all the sugar is melted we empty it into a tank with a gate at the bottom, which is elevated, in order to run the syrup from the tank, to a 60-lb. honey-can on the scales. We set the scales to weigh 55 lbs. net to the can. This will fill the can about the same as 60 lbs. of honey.

The syrup is drawn to the out-yards in these 60-lb. cans, and is not weighed again. We feed in Miller feeders that hold 20 lbs. Four or five tin pails are provided to use in feeding. We weigh 10 and 15 lbs. of the syrup in these, and mark the levels on the sides of the pail. The combination of these two weights will make any weight we need, and it is much more convenient than weighing the second time, besides being accurate enough for the purpose. As we do not feed a colony less than 10 lbs., the hives are marked 10 lbs., 15 lbs., 20 lbs., 25 lbs., and 35 lbs. short, the latter weight showing that the colony has nothing but empty combs. The colonies marked to be fed from 10 to 20 lbs. are fed all their allowance at once. The few that are marked to be fed 25 to 35 lbs. are given their additional 5 to 15 lbs. as soon as their feeder will hold it. To expedite matters, the colonies that have to be fed most are fed first; so if any have to wait, it will be those that do not need so much, and may be fed when the first-mentioned colonies are getting their second feed.

We buy and keep, for the purpose, shallow supers with strips of tin nailed on the lower inside ends for the feeders to rest on. When not in use they pile up to good advantage, and, with a hive-cover on top, are kept away from the dust and flies.

Remus, Michigan.

[We wish to place strong emphasis on the statement of Mr. Townsend, to feed the syrup *thick*, and, we may add, give it all at once, or at most in two feeds. If possible, give it all in one feed, sufficient to meet the needs of the colony until the following summer. We fed last year, in small dribs, syrup half and half; but we found at two of our yards that the colonies that were strong in summer dwindled very rapidly in the

fall. The effect of slow stimulative feeding was to use up the vitality of the bees just at a time when we should have had a large force. In former years we fed *thick* syrup without any reduction in the strength of the bees.

Recent discussion in these columns has practically shown the advantage of thick syrup for winter feed, and in one large feed. For this purpose, feeders capable of holding as much as 25 lbs. are desirable. As to the feeder, any standard construction will answer very well. Even a large tin pan with wet cheese-cloth placed on top will give excellent results.—ED.]

COMB HONEY SOLD BY THE SECTION INSTEAD OF BY WEIGHT.

BY A. F. BONNEY.

I recently wrote the following letter to the Board of Food and Drug Inspection of the Department of Agriculture: "Inasmuch as liquor-dealers are still allowed to sell 'short' quarts, simply being required to put up a notice that 'All bottled goods are sold by the bottle, not by measure,' would the enclosed label conform to the law?"

I based my question on the fact that bee-keepers have used practically the same size of section ever since the section was invented. I also asked particularly how we were to tell that *comb* honey meets the requirements of the law, as to moisture and sugar, when it is sealed, inasmuch as one might test 50 per cent of the stock on hand and find it all right when the rest would run over or fall short. To this I received no reply, but the following letter shows the opinion of the Board in regard to the label.

Buck Grove, Iowa, May 1, 1908.

Dr. A. F. Bonney:—Replying to your letter of the 20th instant, I regret to advise you that I am not authorized to approve or criticize labels submitted in connection with the enforcement of the Food and Drugs Act of June 30, 1906, as you will note by reading F. I. D. 41, enclosed. As a personal opinion, however, I would say that the use of the expression, "This package is sold as a section, not as a pound," in connection with your honey, would not be in violation of the act. Your attention is drawn to regulation 29 (Circular 21) in which you will note that a statement of the weight of a food product is not required to be given on the package. I have examined the label which you set forth in your letter; and if the honey on which this is to be used fulfills the requirements of the standard for honey promulgated by the Secretary of Agriculture, and which is found on page 11 of Circular 19, enclosed, there would be no objection to its use, with the exception that you would be going too far to designate the article as *absolutely* pure.

F. L. DUNLAP,
Acting Chairman.

Washington, D. C., April 24.

COMB HONEY PRODUCED WITHOUT SEPARATORS.

How to Make the Bees Occupy the Whole of the Super at Once; Keeping the Brood-nest Free from Surplus Honey; Preventing Swarming.

BY ROLAND SHERBURNE.

The reading of Mr. Hand's article in Dec. 1st issue, page 1503, on the size and shape of sections, prompts me to give something of my experience. I have raised tons of comb honey without separators—in fact, I have never used them. It is to be hoped that some one will find a better plan than any we now have; but if I had to use separators to produce good comb honey I would give it up and run for extracted entirely.

Now, Mr. Editor, I want to protest most emphatically against extracted-honey producers telling us how to produce comb honey. The latter is a science in itself, and has little in common with the former. No man is in position to give advice on this subject unless he has made a success of raising comb honey himself, or at least has been intimately connected with it. Again, in extra good seasons we may get inflated ideas that will require the next two or three years to get rid of. My experience has led me to advise large hives and plenty of room when running for extracted honey, and a small brood-chamber as a working basis when running for comb honey.

I want to say a word in favor of the much used and much abused $4\frac{1}{4} \times 4\frac{1}{4}$ 7-to-the-foot section. One trouble with section-supers and brood-chambers is, there are too many misfits. Some put a T super or a super without separators over a ten-frame Langstroth body, and expect fine section honey. The result is nearly always a failure. Such large hives should always have a section super with separators, so if the bees have a mind to commence somewhere in it during a good honey-flow they *must* build straight combs. He does not blame the large brood-chamber—oh, no! He condemns the super. A year or two ago some one wrote that the T super was the poorest of all he had tried. I think he told the truth; yet I would like to add that I presume his super and brood-chamber were a miserable misfit. If a man wears a pair of boots that are too large or too small he will surely blame the boots for hurting—not himself for wearing them. My experience has been that an eight or ten frame full-depth Langstroth brood-chamber is too large as a working basis for any comb-honey super holding 28 sections without separators, to give best results.

I use a modified T super with $\frac{3}{8}$ stationary cleats on the sides for bee space outside the sections, and bodies with closed-end frames that meet the requirements in our locality as nearly as I can make them. In fact, I am working along different lines at the same time. I handle hive-bodies and half-bodies as horizontal divisible brood-chambers. I never handle frames in the brood-nest.

Thirteen years ago I commenced using T supers without separators, separated with wood-zinc queen-excluding boards from hives with eight frames six inches deep. If two swarms went

together, so much the better. The results were great; nearly all the honey was stored in the sections, which were often filled first. However, there was not enough honey left in the brood-chamber. The hive was too weak in bees and honey at the end of the early flow to recuperate for the fall flow if we had one. These six-inch bodies were to be used double as a brood-chamber the next spring and summer; but two of them proved too large, as a rule, for best results.

I next tried eight frames, 7 in. deep, inside measure, thus adding the capacity of one L frame. Such a body is large enough for an ordinary queen to keep filled with brood without adding an extra seven-inch body.

Here in Iowa I always prepare for two honey-flows whether they materialize or not—the white clover and fall flow. In the spring I double up all weak colonies until all are reasonably strong and I get them ready for the white clover. My aim is to start the bees to work in the sections without their getting the swarming fever. In this I am fairly successful, though not wholly, of course. I find that, if I can get the bees hard at work in the sections at first, then giving the right kind of room at the right time, I never have more than 25 up to 40 per cent of the colonies run for comb honey that swarm in the worst of seasons.

I am much taken with Mr. Hand's system, and shall try to work it in as fast as practical the coming year by combining his and mine. I hope to reduce swarming to a minimum.

I also have 100 or more half-bodies with extracting-frames $4\frac{1}{4}$ inches deep, inside measure. I intend to fill as many more as I can of these next season, and I shall use all of them in connection with the seven-inch frame. These shallow extracting-supers with $4\frac{1}{4}$ -inch-deep frame I consider very necessary in a yard run for comb honey, for they can be used in many ways above the brood-nest with a queen-excluder between to give more room and to hold odds and ends of honey before the main flow begins or they may be used, when necessary, to enlarge the brood-nest and give the queen more room, but especially to keep honey out of the brood nest. The old way of adding more full-depth combs does not take or keep honey out; it only gives more room for plugging. The uses to which these shallow half-bodies for extracting can be put have often been told in GLEANINGS, so I will not speak further in regard to them.

A queen that will not keep eight seven-inch frames reasonably full of brood in season is not worth keeping; but some need more room, and they must have it as soon as needed. I make it a rule not to put on a super of sections until the colony is strong enough to fill all or the greater part of it with bees at once. They will soon be working in all the sections, and these will grow naturally and evenly. This is the secret of success in using sections without separators. We are told to put on sections when the bees commence to whiten the combs; but unless the colony is strong the brood-nest will be plugged with honey, and we know what that means. I prefer putting a half-body over a queen-excluder to hold the honey, and waiting a few days. When ready I place the super of sections under the half-body and over the queen-excluder, and then there will

be no trouble about the bees entering the sections. In a short time I take off the half-body. When possible, by interchanging the sectional brood-chambers, I place the super of sections over the center of the brood-nest. In any event I want no honey between the brood and the top-bars next to the sections unless it be in the outside frames.

I find that seven to the foot is the limit in width for sections to use without separators, and am quite sure a narrower one would be better. I do not think this section should be used with separators, for it would be too light in weight for the trade. I like it because it comes so near averaging 1 lb., because I think I can secure more honey and with less work by this system in my locality; but I am ready at any time to change when I think it will pay.

I am glad to know we have such an able exponent of up-to-date bee-keeping as Mr. J. E. Hand. With his method of handling hives he is bound to make a success of these trial sections. Let us have all the results we can of his valuable experiments.

Lone Tree, Iowa, Dec. 12.

HEADS OF GRAIN

FROM DIFFERENT FIELDS

WHY WAS THE QUEEN NOT KILLED?

I have only one colony. About April 1 I found this to be queenless—hopelessly so, but with plenty of bees and stores. As to requeening I was advised to give a frame or two of brood and to introduce a queen later on, for to give a queen to a hopelessly queenless colony at this season was considered an uncertain procedure. This seemed like good advice, so I procured from a near-by friend two frames of brood with a quantity of bees on each frame, also the queen with them, intending to hold her caged and introduce later. In placing these two frames in my hive they were examined *very* closely; but I failed to find the queen, and concluded she was left, with many bees, in the box in which I brought them. Such was not the case, and the matter remained unsolved, on the supposition she had taken wing in the transfer. When I closed up my hive there commenced a battle royal in which I judge every strange bee was killed. This was April 17. On April 23 I examined my hive and found brood hatching out, but no queen-cells—plenty of eggs, the queen I had brought, and all going well. A full week's work had been put in. To make the story short, is it not likely that the turmoil caused by the battle had diverted the bees from the tendency to kill that queen until she had acquired the hive odor sufficiently to make her acceptable to them? This is the only construction I put upon it. A witness of this operation said at the time, "A hundred to one the queen is not in that hive; or if she is, she is killed."

Pottstown, Pa., May 22. EDWARD LESTER.

[A very good way, and one of the best, to introduce a queen is to give her with a couple of frames of brood and bees to the queenless colony.

Such colony, if it is hopelessly queenless, and the queen is placed between the given frames, will usually accept if it be a gentle strain of bees. If it be a cross one, it is a doubtful method.

In the case above recited we should judge the bees were hybrid, black, or a cross strain. It is then necessary to use smoke in uniting a strange lot of bees with them. In this case it might or might not have prejudiced the safety of the queen. It is a wonder, in the general free-for-all fight, that the queen was not killed. The bees were so intent on killing each other that they possibly did not notice her until she had acquired the same colony odor or the odor of the surviving belligerents. There are queer things that happen in bee culture, and this seems to be one of them.—ED.]

LIQUEFYING HONEY ON A SMALL SCALE WITHOUT DANGER OF OVERHEATING.

On page 145, Feb. 1, occurs the sentence: "With ordinary methods there is danger of scorching the honey on the outside of the mass while the center is still granulated." I have a plan which I thought of before reading the article and sentence quoted, and which is expressed in words found in the second paragraph, viz.: "There is a method that almost any one can fol-

A HONEY-LIQUEFIER; A HOUSEHOLD UTENSIL THAT CAN BE BOUGHT AT ANY LARGE HARDWARE STORE.

low, whereby a great difference between the temperature of the center of the granulated blocks and that on the outside can be avoided." Perhaps you have seen the tins (a tube running up the middle) used in making "angel cake." Well, we have a taller tin here in Boston, used for making brown bread, plum puddings, etc., with a cover on it that can be fastened. The tube is closed at the top (probably to keep water from running over into the interior and contents of the tin. We have just tried the thing, and succeed-

ed in liquefying honey, which was very thickly candied, in a very few minutes, using only moderate heat. In fact, as Mrs. Levens says, "It worked finely." There is a tight-fitting cover to the can.

The same principle could be made use of in constructing a can on a larger scale.

Malden, Mass. JOS. B. LEVENS.

LACK OF ENERGY DUE TO TOO MUCH HONEY IN THE HIVE.

Mr. Editor:—Noticing your editorial on page 742, on "diagnosing colonies by the bee-flight at the entrance," I am constrained to make a suggestion. In making a comparison of two colonies, you speak of one with a moderate amount of brood and a large amount of honey; but the bees, though a good force, are not flying much—but *why*, you do not know. Please allow me to ask why they should fly in the case you mention. There is no place to put stores if they brought them. Now, you just enlarge the brood-chamber by putting in empty comb; or put a surplus body on top, and scratch a few of the combs that have hard cappings that have gone over the winter, then notice the difference in the conduct of those bees. It is not the fault of the bees, but of the manipulation of the hive in the case mentioned.

WM. M. WHITNEY.

Evanston, Ill.

[In the case under consideration, of the colony with a large amount of stores and little activity at the entrance, we see, on looking up the reference, that we gave a wrong impression. The colonies in question had plenty of storage room; but relatively they had much more than those that were busily at work. The lack of energy, while it might have been due in part to the cause you ascribe, was more due to the queens. There were only three in all, and they did not do any thing all the season, and we have since re-queened them.—ED.]

MORE EXPERIENCE WITH BEE PARALYSIS.

On page 1568, Dec. 15, 1907, you asked to hear from other subscribers about the trouble mentioned by Mr. Youngman. Ten years or so ago I noticed a few shiny bees in one of my hives, which the other bees seemed to be worrying. Afterward this hive cast a big swarm, and the trouble seemed to vanish. Next season, in the early part, this swarm developed just about as Mr. Youngman says his did. There were plenty of shiny trembly bees as well as those not shiny, but which were greatly swollen on the inside and outside, and out on the rock in front. The colony was depopulated so fast that the bees were unable to store honey except for themselves. I examined their brood, and it appeared to be perfectly healthy. The other bees nosed around the affected bees, and it spread to other hives, though not to any great extent, so far as I could see, only a few bees among other hives being shiny. I sulphured this badly affected hive and burned the frames, brood, and honey. I was afterward told the trouble was paralysis. I have not had any as badly affected since, though there is more or less of it among my bees, and it does not seem to prevent them from building up strong for honey or to swarm, as they may be inclined.

In a few other colonies I have noticed some of the bees were swollen, and in one of these I found the queen outside, apparently paralyzed. I warmed her up, and she seemed to be about right. I then put her back, but afterward found her outside dead, if I remember right. Afterward I put the frames and bees into a super over another hive without any harm to the other bees so far as I could see. The stronger a hive gets, the less noticeable the paralysis becomes.

Alpine, Cal.

C. E. FOSS.

[It is generally believed that bee paralysis is a constitutional disease—that is, that it comes from the queen. Certain it is, in many cases at least, the removal of the queen effects a cure, but not always. In advanced stages the disease may be transmitted through the bees after the queen has been taken away. The brood or the comb does not, apparently, carry bee paralysis, providing all the bees are shaken or brushed off. All such combs can be given to healthy colonies.

Mr. O. O. Poppleton, of Florida, who has had a very large experience, advises, after the brood has been given to other bees, to brimstone the affected colony, as he thinks it a waste of time to try to cure the sick bees.—ED.]

DENTS IN THE THORAX OF THE QUEEN NOT DETRIMENTAL.

Referring to the May 15th issue, page 621, I would say that we have had a few queens with dents on top of the thorax, and have not noticed any incapacity in laying. By chance the queen that we chose to breed from has been marked with a large dent since the spring of 1907. If you think such a mark a defect, or a detriment in the effect on the daughters, then we would not breed from her. We selected her because her color is an attractive dark leather (not yellow); the workers are three-banded, and the most gentle we have in our apiary. They also build comb with white cappings.

Hemlock, O., May 20.

P. BIESEMAN.

[If the dent in the thorax of the queen does not interfere with her egg-laying she would, of course, be all right for any purpose.

According to our experience, the leather-colored strains are much superior to the bright, yellow stock. Nearly always more gentle, they are hardy, and good workers; but, unfortunately, the trade seems to prefer the extra-yellow stock. We are discovering that many are going back to the darker yellow. It is the original type of Italian before it had been tampered with by man.—ED.]

HOW TO ADD EMPTY SUPERS ON A COLONY STORING HONEY.

Do you leave the supers on after the cells are capped? I put one on this spring; and when it was about half full I put one under it and then the third, but they seemed to be very long about capping it, so I took the two top supers off and took what was well capped, and the others I put into one super and set it back. Was that right?

Mineral Ridge, Ohio. JNO. WAGGONER.

[Comb-honey supers should be taken off as soon as filled. Your plan of handling supers as outlined in your letter was nearly correct. Dur-

ing the fore part or the middle of the honey-flow the empty super should be placed *under* the one partly filled. As the season begins to wane, the empty one should be placed on top, for it is far better to get one super completed and well capped over than to have two partly filled, neither of them having any capped combs. In the case cited you should not have given the third super as soon as you did. The first super should be well capped over before giving a third.

As the season closes, or comes to a close, one can, where there are only a few colonies or a few supers to handle, take out the filled sections, placing all the unfilled ones in one super to be placed back on the hive; but in large apiaries this is impracticable, for the honey can then be handled only by full supers.—Ed.]

HOW TO TELL WHEN A COLONY HAS SWARMED.

I have a colony of bees that, so far as could be seen, had no queen, though it has been making much honey. It has been lying out on the alighting-board several days. I have looked several times for a queen, but could find none. The colony had considerable capped brood, but no unsealed. On 27 I found three queen-cells, and saved one and destroyed all others. This morning the colony swarmed and went away. On examining the hive I found what I thought—the queen hatched from the recent cell.

I have two other colonies in the same condition—not so much capped brood as the other, but no signs of brood in the larval state. Had the first a queen? Have these other two a queen? If so, why don't they lay, showing signs of their presence? M. F. SAULE.

Crestline, O., July 2.

[It is our opinion that the queen of the first colony died just before the bees were ready to swarm. If the bees had not been hanging out, and were reduced in numbers, we should say that a swarm had issued from the hive. At all events, as soon as the first virgin hatched she led out a swarm.

In the case of the other hives mentioned, we should say that swarms had issued, leaving capped brood and queen-cells.

If one does not keep a close watch on his colonies he will be liable to let swarms get away, with the result that he will have weak colonies left, a lot of queen-cells, and more or less after-swarming.

We may usually set it down as a rule that, where a colony is reduced in strength, has capped brood, no eggs nor queen-cells in the height of or following a honey-flow, a swarm has issued. If we find the same condition, either before or after the honey-flow, it can be explained on the ground of supersedure.—Ed.]

WHY SHADE FOR BEES IN SOME PARTS OF CALIFORNIA IS DETRIMENTAL WHEN GIVEN ALL THE TIME.

It was a surprise to note Mr. Leslie Burr's comment upon the average "Californian's horror of natural shade," in the Sept. 1st issue of GLEANINGS for last year, p. 1152. I say surprising, because Mr. Burr has spent a season in California, actively engaged in apiary work, and

must have noted the sharp contrast in temperatures between night and day. Here is the point: The nights are cool, and the hives do not become sufficiently warm for bees to do their best work until too late in the morning. Especially is this true when comb honey is the desired object.

The wax-workers can handle their material only when the temperature is sufficiently high to render the wax pliable. It is a case of no comb built, no honey stored, with bees in shade, and a cool spring season combined. The last season emphasized this very strongly. For the benefit of young apiarists who may possibly establish apiaries in a locality where the nights are cool, I would say, *place your hives in the sun*, in double rows, back to back, as suggested by Mr. Burr. But he must be able to control the shade to fit the conditions. Give it, if needed, and it will be needed if a Langstroth frame is used, or if the combs are new and tender.

The above is in explanation, rather than in criticism, of Mr. Burr's article, which is full of helpful suggestions. F. E. BAGNELL.

Simi, Cal.

DEAD OR FOUL BROOD IN THE HEIGHT OF A HONEY-FLOW.

I have run up against a trouble which may be serious. I am keeping only a few stands of bees. Yesterday, while looking over my bees, I found one colony which had three cells of foul brood, and I think the colony will swarm in about a week; then I am going to give them your starvation cure.

What is your experience in confining bees three or four days on a set of frames filled with full sheets of foundation? Will it leave the foundation in good condition to make comb?

Wellsboro, Ind.

W. H. SANDERS.

[It is our opinion that what you report is nothing worse than dead brood. During very hot weather, especially if the bees have been sent by express or freight, some of the brood dies because it is overheated or improperly nourished. It turns brown, and in some cases assumes a slightly ropy character. This would rather indicate foul brood, except that we find this condition in the height of the honey-flow when the weather is hot, whereas real foul brood generally disappears when honey is coming in freely. In your case, at least, we should say there was no disease of any sort, but would advise you to keep a close watch to see if it becomes any worse. If you look through the hive you will find in the course of a week that this dead brood will all disappear.

If you confine bees in hot weather for three or four days on foundation the probabilities are that the foundation will stretch and may melt down altogether, making a bad mess in the hive. The bees should not be confined in the hive unless they are kept in a cool place, say down cellar.—Ed.]

PROPOLIS FROM SWEET-GUM TREES.

I have noticed several theories as to where bees procure propolis. In this locality it is gathered almost exclusively from sweet-gum trees. I have 75 colonies, and care for many others, and have never discovered at any time any other substance than pure gum wax. W. C. DAILEY.

Crothersville, Ind.

A HIVE-LIFTING WHEEL-CART.

Honey production having grown from retail to wholesale, hives, of necessity, need handling more rapidly and easily. As shown by your journal, honey-producers are trying to evolve a portable crane. Now, why multiply tools when they are already too numerous? The above suggested the idea given herewith. Every professional apiarist surely must always need a hand-cart of some sort. Then why not try to make it do more than one thing? By the plan shown in the illustration I think any one can modify the details to suit his needs; as, owing to hives being so various in many ways, one particular pattern would suit only one man. In a truck made as suggested, I would have the floor-boards of the truck nearest the front free—just to rest on the handles—and kept in place by cleats on the under side, either to come inside or outside of handles, so that when the truck is wanted to lift hives off the bottom-boards or to carry to another stand they can be removed; and by opening the front pull-bar the handles may be sprung open sufficiently to go easily each side of the hive; and when the pull-bar is put back in place and the pin put in, the hive can not slip or shift. The drop-leg shown will hold the hive up and leave both hands free, and two ends and sides clear to work at. As regards the drop-leg, make the joint so that the leg will be free to work only one way—back and forth; otherwise the weight of the hive will swing the truck round and let the hive down. I suggest a joint something like the hinge of a rule; and below the pin the leg swings by, have a hole right through the joint and leg to put a pin through; then the truck can not possibly move. Now, when you lift a hive by the truck you can, if you wish, move it sidewise, or back or forth, as needed; and in putting it back you can guide it home to $\frac{1}{16}$ inch. When the drop leg is lifted for ordinary work about the yard I would have short fixed legs to come, say, just back of where the back of the hive comes for lifting; and when the drop-leg is hooked up to the side-rails it is out of the road. With the loose floor-boards in place,

you have a handy cart for carrying supers and the many other things needed in a yard worked for bread and butter. With a pair of wheels and an axle a handy man would make it in a day, and have a tool that would make many a hard task pleasant and easy. JOHN BELL.

Greenhithe, Auckland, N. Z.

[The arrangement shown is very good, providing the ground is not uneven, and hives so placed that one can get around with the outfit. We are working on a modification, the lift being in front of a pair of wheels rather than in the rear. All these devices seem like a lot of machinery, and it is a question how far they can be used to advantage. We shall have more to say on this question at a later time.—ED.]

A NEW HIVE-LIFTER.

I would not bother with a hive-lifter for one super or for two or three eight-frame comb-honey supers; but when I have a good crop I have two, three, four, and sometimes five ten-frame supers on at once, and then is the time I expect a lifting-device to be of use.

The standard or upright part of my lifter is a $2\frac{1}{2}$ -inch boiler-tube 5 ft. 9 in. long. There are three oak legs, $\frac{3}{8} \times 3$, by 4 ft. 6 in. One end each of these three strips is fastened to the upright pipe 18 inches from the lower end. The other end is connected to the lower end of the pipe by a light iron brace, making a triangle of each leg. The angle is such that the lower end of the upright is three or four inches above the ground. Three light iron braces about ten inches from the center connect the legs and hold them the right distance apart. The upper part of the lifter is a piece of barn-door track 3 ft. 9 in. long. It extends out 2 ft. 4 in. from the center, and is free to make a complete circle.

The tackle-block may move in toward the center or out to the end of the track; a bolt through the end of the track prevents it from running off. The end of the track has supported the weight of a 210-pound man.

This first machine weighs about 40 lbs. It is heavier than necessary. The proportions and details could be much improved, making a lighter machine; but just as it is, it is very easy to handle, as one can take a good hold with scarcely any stooping. It would be easier to pick up the

hive-lifter than to lift one ten-frame shallow extracting-super. My hives are in pairs. I can, therefore, handle two colonies with one move of the machine. With two or three supers on, it is hard work lifting to put on another or to get at the brood-nest. With the lifter I expect to lift as many as four at once, swing them to one side, manipulate the colony, and put on a fifth super if necessary. In taking off honey with escapes, I think it can be put right on to the wheelbarrow.

H. E. GREENWOOD.

Oshkosh, Wis., March 23.

[This lifter embodies some good principles. It represents a good deal of machinery, and probably could not be used to advantage except where there were more than two supers. We have been making some preliminary tests with devices of this sort, and find that the time taken to place them and get the standard vertical is considerable if the ground is uneven or the hives are arranged in groups. Still we are of the opinion that in the case of the "sky-scrapers" a device of this kind can be used to very good advantage, thus saving considerable strain on the back, and at the same time enable one to put an empty under the partly-filled supers without doing any direct lifting himself.]

It is our opinion that the three legs on the machine should not be attached to the upright standard rigidly. They should be more in the nature of a tripod with legs having a certain degree of adjustment, thus allowing one to make up for the uneven ground; for it is very important that the standard or upright be vertical, otherwise it will topple over when the load is put on the projecting arm.—ED.]

HOW TO DISINFECT HONEY FROM A COLONY AFFECTED WITH FOUL BROOD.

I have a number of colonies, I don't know how many, affected with foul brood; and if I shake them I shall have to wait till fall, and feed them on the fall flow. Would it be safe to shake them now and feed back the honey taken from them after heating or boiling it? Would it be safe to use partly drawn and filled section-supers from over-diseased colonies?

J. G. CRISLER.

Walton, Ky.

[You can feed back the honey, taking it from the hive that has had the disease, providing it has been boiled for 20 minutes, allowed to stand for two or three days, and boiled again for the same length of time. In the interval the germs undergo a state so that the second boiling takes effect and destroys any germ life that may exist. We would not advise you to put supers that have been taken off from diseased colonies on to healthy ones; but the honey from the diseased ones would be perfectly safe to use for the table or to sell; but be careful to place it where the bees will not get at it and so spread the disease by robbing.]

When honey is coming in freely, don't shake the combs, as it will be spilled over the ground, on the hive, on tools, on clothing, and everywhere. At such times, brush with grass or weeds and then burn whatever you use as a brush. No honey should be spilled or daubed on tools from a foul-broody colony, as you might thereby spread the disease to other colonies.—ED.]

DOES IT PAY TO KEEP OVER A QUEEN THAT IS POOR HER FIRST SEASON?

I notice some writers say that, if a queen fails to lay enough eggs in a poor season to keep up her colony, the next year (if a heavy flow comes on) she may turn out to be as prolific as any queen in the yard. I do not agree with this; for I have invariably found that, if a queen was no good in her first season as an egg-layer, she was of no account the next season; therefore, if I find that a young queen is practically worthless the first season it is her last one, for more bad honey failures come from no-account bees, caused by no-account queens, than all other sources of failure combined. Early in the spring one can estimate the good qualities of any queen, almost, by the hustle displayed.

J. A. BEARDEN.

Harms, Tenn., June 1.

HANDLING QUEENS WITH CLEAN FINGERS.

Doesn't it look reasonable and very important to have perfectly clean hands, so as to be free from any odors, etc.? Then rub the fingers and thumb over wax or comb before picking up and caging a queen and her attendant bees. Sense of smell is very keen with bees.

Hallowell, Me.

E. P. CHURCHILL.

[We doubt the advisability of smearing the hands with beeswax or combs, as that might introduce the odor of another hive. Better put nothing on them, and, when washing, avoid scented soaps.—ED.]

DOES SAGE YIELD HONEY IN IDAHO AND UTAH?

Does sage yield honey in Idaho and Utah? I saw miles of it there, but could not learn that bees get any honey from it.

FR. HOLMES.

Hillman, Mich., May 14.

[Possibly some of our readers can reply to this question.—ED.]

Is it safe to introduce a queen in a hive where it has been queenless for some time?

Martinsburg, W. V.

C. H. MASON.

[It is a little risky to introduce a queen, especially a valuable one, in a hive that has been queenless for some time. The colony may have laying workers or a virgin. In either case it would be practically impossible to introduce a fertile queen. Before attempting to introduce we would advise giving a frame of *unsealed young brood*; and if the bees build cells therefrom it would be safe to introduce, as the presence of the cells would indicate that the bees were without a queen.—ED.]

Is there honey in the second-crop clover?

Willink, N. Y.

A. G. STERLING.

[Some honey is secured from a second crop of clover. It depends upon the season and somewhat upon the bees.—ED.]

Convention Notices.

The Central Tennessee Bee-keepers' Association will meet at the rooms of the Nashville Board of Trade on Saturday, Aug. 8.
J. M. BUCHANAN, Sec'y.

OUR HOMES

BY A. I. ROOT

Therefore shall ye lay up these words in your heart and in your soul, and bind them for a sign upon your hand, that they may be as frontlets between your eyes. And ye shall teach them your children, speaking of them when thou sittest in thy house, and when thou walkest by the way, when thou liest down, and when thou risest up.—DEUT. 11: 18, 19.

I hardly need remind you, friends, of the great work that the juvenile court is doing in this land of ours. Instead of punishing boys for their crimes and misdemeanors, this juvenile court is looking after the parents and others, to see how far the blame rests on some grown-up person instead of on the boys. I have told you something about Judge Lindsey, and how he has been punishing the saloon-keepers and others, and in various ways making bad boys good ones without shutting them up in prison and fining them; and I think we can all say, "May the Lord be praised for the better methods that are being instituted, not only in our great cities, but in the country also, for a way of leading boys out of iniquity and into righteousness by gentler means than the strong arm of the law."

Not ten minutes ago I was told that one of the boys in our employ had been helping himself to some Yellow Transparent apples that are just beginning to ripen close by our home. Now, this would ordinarily be considered a small matter; but just now apples of every sort are very scarce and expensive. We have only this one tree, and I have been watching it carefully in order to get the first ripe apples. You may remember that apples are my medicine. This boy's business is in the lumber-yard; but when he goes after the horse he uses, he goes pretty near the apple-tree. If there were only one boy it would be a small matter; but if all the hands in the lumber-yards scattered over our grounds should help themselves to our early apples there would not be enough to go around, let alone having enough for our own use. I met the boy soon afterward, and started to explain to him why we could not well spare those early apples; but as there were others standing around I hesitated. A boy's feelings are easily hurt, as I can well remember, even if I am almost seventy years old. I did not say any thing to him about it at all just then; but instead of that I hung up a board on the tree, in plain sight, saying, "Hands off."

With this preface I wish to tell you that I have just returned from a trip to our "cabin in the woods" in Northern Michigan. When I got ready to go up there just after the 4th of July, three boys in our neighborhood petitioned to go along and camp out in said cabin. I consented under certain conditions. Their mothers were to instruct them in the art of cooking so they could keep house and board themselves; and each one was to take along a few needed utensils.

We reached Traverse City in good health and spirits on the 7th of July. I had planned taking the boys up to the cabin on a gasoline-launch; but there had been a storm, and the waves were already throwing up white caps. A fishing-boat, however, had just brought in five tons of fish, and the managers of it said *they* would take us if we could wait until they unloaded—that is, if we

would not get seasick from the rolling and tumbling. These boys, fourteen, fifteen, and sixteen years old respectively, clamored for the trip on the fishing-boat. They were sure *they* would not get seasick. Well, when we reached the dock, eight miles away, the boys declared it was the most delightful boat-ride they had ever had in their lives. Of course, they could not stand up without holding on to something; but they got up near the pilot, and he explained to them how he met each great wave, and told them stories of fishing adventures on the beautiful waters of Grand Traverse Bay. Sometimes the boat would actually jump from the top of one large wave to the next, and then it would come down and strike the water with a crash that seemed as if it would smash the boat in pieces; but it was built for just such business.

We started up the hill toward the cabin, with our valises and other luggage. About as soon as we struck solid land, however, I looked over the wire fence and saw great luscious strawberries in such abundance that I was sure the proprietor had some to spare. As they belonged to Mrs. Heimfurth, my nearest neighbor, I took the liberty of inviting the boys to refresh themselves, and we ate to our hearts' content. When I got to the house I took out some money to pay for our treat; but my good neighbor absolutely refused to take a copper. She said they were short of pickers, and they really had more berries than they could take care of.

In a little while we were up to the cabin—see picture on page 658, June 15th, 1905. It was the first time I had paid the dear old place a visit this year, and I eagerly scanned the premises to see how my stuff had prospered since the fall before. The first thing that caught my gaze was my eight different varieties of currants. The fruit was dead ripe, and some of the great clusters were up higher than my head; and, by the way, it seems to me I never saw currants anywhere so delicious as those in that fruit region of Northern Michigan; and the glittering red of the ripe fruit that had not been molested by birds or any sort of currant-worm, it seemed to me, was more enticing than any thing else one can well imagine. Then I glanced beyond the currant-bushes to the mulberries. Let me explain a little.

Some six or seven years ago, when ordering some peach-trees and other stuff I told the nurseryman to put in two of his very best improved mulberry-trees, but I said nothing about the price. When I found he had sent two trees at \$1.50 each, I protested, and he finally cut the price down to a dollar. One of the trees almost died, and I was tempted to dig it up and throw it away, but I finally concluded to give it one more chance. For two years it put out only a very feeble growth; but now, however, it is a great tree with branches higher than my head. The other one made a prodigious growth, with branches which went away up in the air, and then down to the grass. One of my neighbors said it was what is called the "weeping" mulberry, and that it was worth nothing for fruit but only for ornament. Until this year it had been only a great mass of long trailing limbs, and I had decided that my dollar mulberry-trees were just a big swindle; but, lo and behold! on that July morning both trees were bending under their

loads of luscious fruit. And that was not all. The berries had been dead ripe, evidently, for some little time, and the fruit had dropped on the ground and almost covered it. One of the trees bore berries of a jet-black color, not as large as the ones we have in Florida, by considerable, but I do not know but they were just as delicious. The other tree, the weeping mulberry, was a surprise. The fruit was of three different colors—black, pink, and white; and the berries of all these colors seemed equally ripe and delicious. Why, I would not take ten dollars apiece for those two mulberry-trees, and yet I had been cherishing unkind thoughts all these years toward the man who sold them to me.

Of course, the boys made haste to appropriate their share of the fruit, even if they had just had a treat on strawberries. I think, while I am about it, I will finish up what I have to say about the fruit of that region right here.

The next day we walked over through the woods to a neighbor's house, that of Mr. Werner, a good farmer. He always has good crops of every thing, no matter what the weather is. On the side-hill close to his house were some of the finest-looking cherry-trees I ever saw in my life; and when we passed there the trees were literally black and red and yellow with their loads of the choicest and most luscious cherries I ever saw. The foliage on the trees was of a bright rich green that indicated perfect health. I went up to the house and asked permission for myself and boys to sample the cherries—offering, of course, to pay for them. The good lady said we were quite welcome to all we wished to eat.

I wish to stop right here to say that Mr. A. L. Hatch, away up in the northern part of Wisconsin, told me three years ago something about growing fruit. He said that wherever one can get plenty of healthy foliage he will get nice fruit sooner or later.

As I began to wonder at the great luxuriance of those cherries I looked at the ground beneath. It was a rich sandy loam. It probably had been improved by turning under clover or stable manure, or perhaps both. The boys all agreed with me that they had never tasted any cherries equal to those. As the trees were small, corn was planted between the trees, but not very close to the trees; and that corn, even away up there in the north, was about equal to any we have in Ohio at the same time. Of course, every thing is much earlier here in Ohio than there.

Perhaps I should explain that this visit was made just after we had eaten so many mulberries and strawberries. Later on we visited Mr. James Hilbert's cherry-orchard, containing over 400 trees. Before we got in sight we heard the laughter and voices of the pickers, for most of them were girls and women. About thirty were at work. While the cherry-trees did not all show the careful and thrifty appearance of those of Mr. Werner, the crops were literally wonderful. Owing to the recent heavy rains the fruit on some of the trees had become overripe; and Mrs. Hilbert pointed out a tree of Black Tartarians that she said they would not pick because a large part of the fruit was too ripe to bear shipping. She told the boys and myself that we were welcome to all we cared to eat or carry away from that tree. Well, now, I specially en-

joy fruit that most people consider too ripe. It agrees with my digestion better. As we were two and a half miles from home (through the woods and over the hills) I told the boys I thought they could eat just as many of those fully ripe cherries as they chose, without endangering their health. I know I ate a tremendous lot of them, but not one of us four experienced any bad effect from them whatever. I was anxious to see if those young growing boys could bear a great quantity of ripe fruit just as I do when tramping through the woods over hills.

After we had satisfied ourselves with Black Tartarian cherries Mrs. Hilbert told us we must be sure to look through another cherry-orchard over the hill. Oh dear me! I do wish the readers of GLEANINGS could get a glimpse of that cherry-orchard. My good friend Hilbert had ordered all sorts of cherries in order to test them in his locality, and so there were black and white, yellow and red cherries, big cherries, mottled cherries, and cherries of every description; and as we went from one tree to another and tested one and then another, we were tempted to say every time that the last was the best. If you like a cherry that is rather tart, I would recommend the one they call the Dyehouse, especially as it is found in the Grand Traverse region. I bought six Dyehouse cherry-trees some years ago and planted them here in Medina; but we decided *here* they were rather inferior; and this emphasizes the importance of growing any kind of fruit in a locality where it thrives the best. The Grand Traverse region of Northern Michigan is emphatically the place for strawberries, currants, cherries, peaches, and (I think we can add) apples. Last year they had an enormous crop, but there was almost none throughout the rest of the United States, and they are expecting to have another pretty fair crop this year. Everybody grows strawberries in that region, especially of late; and carloads and carloads of strawberries, cherries, and other fruit are constantly being rushed to Chicago and other great cities.

Just now they are also having a wonderful crop of huckleberries. These latter grow wild, without any care or attention whatever; and the yield is so great that wagonloads of people come from miles around and camp out to gather huckleberries. Some of our neighbors near the cabin drove fifteen or twenty miles and brought home loads of berries. Carload after carload of *huckleberries* are now being shipped from various parts of Northern Michigan to the great cities; yet, so far as I can learn, no attempt whatever has been made to cultivate this luscious fruit. Indeed, I believe the greater part of it grows on land that is considered of no value otherwise, or at least is uncared for by anybody.

Now that we have finished the fruit I wish to say something about the "crop of boys" growing up in our country. The two younger boys of our crowd had never before been away from home. I do not know that they had ever been away from their parents over night. About the second day while we were busy at dinner (I think I shall have to digress enough to say that we had black bass for dinner, besides all the fruit I have mentioned) one of the boys stopped eating suddenly. I began to fear he was sick, and was going to

look for some extract of Jamaica ginger. He admitted he was sick, but could not explain just *where* the pain was located. Pretty soon the tears were running down his cheeks, and he finally reluctantly confessed that he was *homesick*. A little later another one was homesick. Then I talked and reasoned with them. I told them about how I had been homesick, and how I got over it. When my arguments seemed unavailing, I told them I could get them all back home to their parents in less than twenty-four hours, if they insisted on it. "But," said I, "boys, I can tell you from my own experience that, if I get you back home now, when you come to think it over you will be more homesick to get back to the cabin in the woods than you are now to get back to see your fathers and mothers."

When prayer-meeting night came at that little church over the hills, that I have often told you about, I persuaded them all to go with me a mile up and down hill through the woods to that pretty little meeting-house. Of course, I had to talk to the people, as I always do when I get around in that neighborhood. In my talk I spoke about the homesick boys. I said it rejoiced my heart to see boys who love father and mother so much that they really consider home the dearest spot on earth. Then I told them about Mrs. Root being sick down in Florida; and I asked the friends to shake hands with the boys and give them to understand that there were good kind lovable people away up in Northern Michigan as well as down in Ohio. After prayer-meeting one of the boys said, "Why, grandpa, I believe that was about the best prayer-meeting I ever attended in my life," and I guess the others thought so too, for there was no more homesickness after that. Now, friends, I am giving you a good rational remedy for homesickness if you ever happen to experience it. Go to prayer-meeting. There is something especially inspiring about that little church, the Sunday-school, its Endeavor society, prayer-meeting, and its preaching services. Ever since the revival I told you about up there, there has been almost constantly something going on to improve it. It has been neatly papered recently, and carpeted. A very nice furnace warms it up in winter, and on this last 4th of July several of the boys and men got together and made a cement platform in front of the door. The planks had been getting old and rotten. I told them in my talk that such work was laying up treasures in heaven, where moth and rust do not corrupt, and where thieves do not break through and steal; and among all the good investments God has permitted me to make, dear friends, I do not know of any other one that gives me more pleasure when I come to think of it than what I have invested in the Bingham church away off there among the hills.

When I first went into that community, about eight years ago, the church and Sunday-school were pretty badly run down; but the saloons at Bingham were doing a big business. Saloons and Sunday-schools can not both well prosper in the same neighborhood. Since the revival I have told you about in the little church over among the hills, the saloon business has gradually gone down; and on this visit I was rejoiced to hear that the saloon had finally given up business entirely. It died a natural death for want of patronage. And this reminds me that I told the su-

perintendent of the Anti-saloon League for the State of Michigan, something like a year ago, that I would give \$25.00 to help inaugurate some temperance work in the neighborhood of our Sunday-school. Now, I do not know how much that did with closing up that saloon; but my impression is that God in his gracious goodness took the matter in hand before the League got around to it, and through the influence of that little church and Sunday-school the business that has wrecked so many homes in years past died out of itself without the aid of the League. Of course, I paid them the \$25.00 all the same. May God be praised for *such* victories over intemperance.

The plan was that, after I left the cabin and went back home, the boys should stay and camp out a week or two as they chose. As other boys may be interested in a like camping-out at some of the North Michigan health resorts I think some of you may care especially in regard to the expense of such a trip. The round trip from Toledo to Traverse City was \$7.50. I told the boys that 25 cents a day each for provisions ought to cover the cost. Butter, milk, and eggs are cheaper there than here in Ohio, and one can get them at almost any farmhouse. The neighbors will usually furnish bread also at a reasonable price. Well, at the time we figured up as I came away, the whole expense was only *21 cents a day each*; and we indulged in some luxuries also that might easily have been cut out. At first we commenced by cooking elaborate meals—ham and eggs, potatoes, postum cereal, etc.; but after many of their tramps through the woods or down to the bay they came back too tired to do any cooking; and so they adopted a *menu* consisting of cereals or shredded biscuit, and milk, and in a little time all three of the boys declared they felt better, and their strength held out better, with just these wheat preparations and milk than with a cooked meal.

Now, this testimony was worth lots to me because it verified T. B. Terry's teachings concerning uncooked food. These boys discovered, too, that it was ever so much less labor to do up the dishes when each one had only a bowl of milk with cereals to go with it. I preferred the Pettijohn rolled wheat uncooked, but the boys seemed to prefer shredded wheat biscuit, toasted corn-flakes, or something of that sort. Many of the staple grains with milk, and occasionally an egg apiece, will surely keep the average person in better health than what is usually termed a "good square meal." We did not go to the trouble of putting fruits on the table, because they were so abundant taken right off from the trees or bushes, and in the latter way we avoided the great quantity of cane sugar that is generally served with fruits on the table.

I am getting several letters daily in regard to this matter of diet and health. Now, just try it, friends, and see if you do not feel better and happier, besides saving a great lot of useless work in getting up these expensive articles of diet. Most of you can live without any meat if you choose by using milk and eggs as I have indicated. Do not forget plenty of good ripe fruit. If you say you can not afford to go into the markets and buy it, then get a little piece of land and *grow* it yourself. It will cost you less than

to buy medicines at the drugstore as you have been doing; and I am sure it will be more pleasing in the sight of God.

After I came away and left those boys alone I was almost homesick for their companionship once more. Their daily talks and discussions had endeared them to me in a way that I shall never forget, I am sure. Of course, we read the Bible every day and had talks in regard to the Sunday-school lesson and kindred topics; and when I took my leave and reminded them that as they were, at least some if not all, members of the Endeavor society, they should remember that iron-clad pledge, to read at least some part of the Bible every day, and they promised me that they would do so. If they do this, and even if there are no fathers or mothers around, or old people to look after them, I feel that the great Father above will keep an eye on them; and I am sure it is a great thing for boys in their teens, especially if they have been brought up carefully in their homes, to try camping out in the woods, doing their own cooking, keeping an account of their finances, and planning on a small scale to be men, and take their places soon as men in this world of ours.

In a recent issue of the *Sunday School Times* we are told of a German father who set his son up in business when the boy was quite young. The son made a failure, but the father did not seem to be much troubled about it. He said he wanted to see how the boy would manage *after* the father was dead and gone. Therefore he decided to let the boy make a test of it before that sad event came to pass. The next time the boy went into business he made a success of it and became a good business man. His early failure taught him some lessons he could not have learned otherwise. It is also an excellent thing to let every boy have a little practical experience in the way of cooking his own meals, keeping house, and learn the consequences of letting every thing drop where he used it last. May God in his great mercy not only be with those three boys away off there in the woods, but with *all* the boys and girls growing up in this land of ours.

POULTRY DEPARTMENT

KEEPING HENS WITHOUT MALES—SOMETHING FURTHER IN REGARD TO THE MATTER.

Mr. Root:—I can not refrain from taking you to task for your remarks on page 837 relative to hens without males. I am surprised to think that a person of your intelligence should think for one moment that hens under such conditions could be happy. "Male and female created he them;" and had you observed them closely under such conditions I think you would agree with me that it is the next thing to, if not quite, cruelty. I shouldn't even think you would need to observe them to know that it would be so. "Doth not reason itself teach you" that animated creation can not be happy long at a time unless both sexes are present? Try it yourself.

Of course, I think folks many times keep too many males; but, "for the sake of humanity, if for no other reason," don't encourage such nonsense if not cruelty.

I enjoy nearly all of your writings, as those of no other man, and hope you may live 50 years yet to give us the benefit of your words; but I think you wrote that without consulting Mrs. R.

Cincinnati, N. Y., July 14.

EMMET B. KIBBE.

My good friend, I own up that I took very much the view you did in regard to the matter,

and I have always maintained that the happy hen is the one that lays the egg; and therefore I was greatly surprised to see the statement from the Geneva station, that hens without males will lay more eggs. Your *theory* is all very good; but if we get more eggs by keeping pullets by themselves, I think we shall have to sacrifice sentiment to plain facts. I *did* consult with Mrs. Root, but her remarks were mostly concerning the surplus of males that are so often allowed in flocks of chickens on the farm and perhaps in country villages. Where a lot of males, especially a lot of young cockerels, are allowed to annoy the hens, the "cruelty" comes on the other side of your argument. I have been carefully scanning the poultry-journals to see what their experienced men have to say in regard to the matter, and I am surprised to find so little touching on a matter of such exceeding importance, not only to poultry-keepers but to consumers of eggs. But I have been rejoiced to find the following in the *Rural New-Yorker* for July 4—from one of the very best authorities. See what they say about it:

MAPES, THE HEN-MAN, AGAIN; "GERMLESS EGGS."

I see on page 470 in "Brevities," that Mr. Mapes is selling guaranteed "germless eggs." As I am in the poultry-business I should like Mr. Mapes to tell us in full how it is done.

D. W. M.

It is a wonder to me that the trade has not sought for "germless eggs," backed by the guarantee of a responsible party, long before this. Most people in this part of the world want animal food in some form as part of their bill of fare, rather than an exclusively vegetable diet. Of all the forms of animal matter used as human food, an egg is best calculated for transportation to distant markets, and can be successfully kept in good condition easier than flesh, fish, or milk. Nature has provided in an egg all the elements of matter needed to grow and sustain the life of a chick for three weeks or more, thus making a complete food of it. The only other example of a complete food which we find in nature is milk. While milk is easily susceptible to all sorts of bacteria and other forms of decay as soon as drawn, an egg is done up in a neat package inclosed in a case that is almost impervious to air and water, and then surrounded by a protecting calcareous shell or case. In the case of a germless egg, this package of animal food will keep in good condition for eating for weeks and months in ordinary surroundings, either summer or winter. If, however, at a certain period in the formation of the egg it is fertilized, we have an entirely different proposition so far as preserving it in good condition for eating is concerned. It now only awaits the application of a certain amount of heat for this germ of life to begin to develop into the chick for which nature has provided this package of food. The necessary heat may come from the bodies of broody hens sitting on the nest, from an incubator, from the sun, or even from fermenting manure or other substances. It takes but a short exposure to the necessary heat for development sufficient to be discerned with the naked eyes, even without breaking the shell. Remove the source of heat after development has once begun, and death results within the shell; and instead of an appetizing package of food we have what might properly be called a coffin.

In view of these facts, is it any wonder that a germless egg is more to be desired than a fertile egg when looking for table supplies?

A hen will lay the same number of eggs, regardless of whether there are males in the flock or not. Just at what period in the development of the egg the germ of life is enclosed, is not so well known; but for all practical purposes we may conclude that two weeks after the males are removed from the flock the eggs laid will be germless. Ten days after I removed the rooster from my "hen-barn" I placed four eggs in an incubator, and one of the four proved to be fertile. About 95 per cent had previously been fertile. At present there is no known way of determining whether or not an egg is fertile, short of applying sufficient heat to start the germ into life, hence the consumer who buys germless eggs must depend largely upon the honesty of the seller. This seems to present great possibilities for building up a reputation, and placing a little bit of "character" into the eggs as well as the barrels of apples we place upon the market. The most approved style of package at present seems to be small boxes or "cartons" holding one dozen each. These are sealed, and the guarantee printed on the box or seal. In view of the chances which the ordinary grocer's egg runs, either from being left in the nest several days under a broody hen, or sitting about a hot grocery, or in the freight car moving slowly to market, or standing upon some siding switch, to say nothing about the subsequent

months in cold storage, it is a wonder that so many eggs reach consumers' tables in edible condition.

It seems that there are three if not more very important considerations in this matter. First, we get more eggs. Second, according to Mapes we get *better* eggs, or eggs that will keep fresh and in good order ever so much longer. Third (and this last argument I do not see mentioned at all), if you have some high-priced stock, and have a surplus of eggs, you do not want other folks following you to the grocery and buying eggs to set under a hen. To avoid all of this, have your choice stock in pens. We are told on pretty good authority that we get more eggs in confinement in a yard than where the fowls have unlimited range. These eggs from your choice stock you sell to neighbors or anybody else at a proper price. The eggs from the rest of your flock that you sell in the market for food are sold at a slight advance because they are fresh and "germless," and the label on each box warns the public that they are *better* for table use, but entirely *unfit* to set, because they would not hatch any way. Then when somebody comes to you, and wants eggs, you ask him whether he wants table eggs at 30 or 35 cents a dozen or eggs for hatching at, say, \$1.00 a setting.

Just one more point: As a proof that eggs will keep a long while in fair condition when germless, even during hot weather, I may mention that I have boiled eggs for chickens, taken right from the incubator, and they looked so good and wholesome that I tasted the yolk several times, and could see nothing wrong about it. In the hot climate of Arizona, where they have a temperature of over 100 degrees for days at a time, eggs have actually hatched out in the stores where they were offered for sale. Other eggs that were germless, kept in the same temperature, were fit for cooking even after they had been kept three or four weeks. Does not this seem to indicate that eggs that can not be used in a short time after they are laid *should be* germless so far as we are able to manage it?

GROWING PARTRIDGES INSTEAD OF CHICKENS, ETC.

After I left the boys, as I have mentioned in another column, I started with my valise over the hills through the woods to the station. I had enjoyed myself so much during the previous week that I was wondering if I could not invent some excuse for staying up in that locality a considerable part of each summer. Let me digress a little.

Just as soon as I got back to the old cabin I put the hammock into that little clump of maple-trees on the hill that overlooks the bay; and just before dinner (the boys cooked the dinner themselves, and it was a nice one too) I lay down in the hammock, as I have mentioned several times before, for a refreshing nap. Oh how I *did* enjoy it! It was a hot July day; but the breeze from the bay rustled the leaves over my head and gave a delicious coolness to my brow as I lapsed into unconsciousness. When I awoke, twenty or thirty minutes later, there was all through my being a sense of cleanness and purity that I have never found in any other locality. Whenever I sleep in a close room my mouth tastes bad when I awake; but up there in that pure

air every thing seems to be pure and sweet and wholesome, and it produces an exhilaration that I never get anywhere else. Perhaps I am exaggerating the advantages of that climate. To tell the truth, I have not *tried* a hammock in the open air, either in Ohio or down in Florida—that is, to any great extent. Well, now, let us get back to that trip through the woods over to the station.

I was considering what I could do up in those wild woods to keep busy and pay expenses during the summer time. As I rushed along I almost ran over a partridge. I have told you before that they are all through my woods up there; and as nobody is allowed to shoot them at this season of the year they get to be quite tame. It seems as if my foot almost struck that mother partridge, for such she was. She went rolling and tumbling out of the way, making a plaintive noise as if she were hurt. I caught on at once; and by searching around in the grass where she first started I found a whole brood of little partridges, just feathered out enough to be handsome. The minute I saw them and took a look at the plump handsome mother, still tumbling around as if she were hurt so she could hardly move, I said to myself—no, I guess I said it out loud, for I was off alone in the woods—"Dear me! why can't I come up here and raise partridges with my Cyphers' incubator just as easily as I raise Leghorn chickens down in Florida?"

As I hurried over to the train I began figuring what nice plump young partridges would bring in the market compared with Leghorn chickens. Perhaps they would not stand confinement; but then Bro. McClave, of New London, O., raises wild *ducks* right along, and lets them fly wherever they wish to go. They always come home at night to roost and for their feed.

When I got over to Manistee I told my brother-in-law, Mr. C. D. Gardner, about my project; but he at once "poured cold water" by the pailful on my speculation. Said he:

"Why, Mr. Root, you can very likely grow your partridges all right, and with comparatively no trouble; but the minute you undertake to sell a partridge in the market you will be arrested, fined, and perhaps imprisoned. A man right here in Manistee, raising brook trout on his own farm, with water from his own spring, was making money hand over fist; but the game laws interfered. It is against the law here to sell trout or black bass. He took the matter into the courts, and fought them until it cost pretty nearly every dollar he was worth. But he had to give it up."

Now, will somebody who is posted on this matter tell me if this can be true? Is it possible that there are laws which forbid the farmer from growing trout or partridges on his own premises and selling them for what they are worth in the market? Of course, I understand the importance of preventing sportsmen from depopulating our woods and inland lakes of fowl and fish; but he who grows thousands of partridges and fish where none grew before, or at least in limited numbers, is, it seems to me, like the man who makes two blades of grass grow where only one grew before. A plump partridge, as everybody knows, is about the finest table delicacy the world affords; and, if I remember correctly, my father and mother,

when they were early settlers, used partridge eggs in place of hens' eggs when they found a big nestful in the woods. Can any of the friends furnish me any literature in regard to the domestication of our American partridges?

Now, for fear you will say this article doesn't belong in the poultry department I wish to quote a little more from that sharp keen business man, Mr. Gardner. I was recommending to his wife (my sister) that she get some chickens so as to keep her outdoors. By the way, she has so far recovered from her malady that she walks all over town at a brisk walk, and stays out of doors a great part of every day. Well, her good husband said something like this:

"The chicken business does not pay. Sooner or later they eat their heads off. I have seen it tried over and over again all my life. Even the men who raise fancy poultry and get big prices do not make it pay in the long run."

When both my sister and I entered a protest he added:

"Oh, yes! there is a man over south a couple of miles who raises eggs for market. He has some little boxes that will hold just a dozen, and every box has a rubber stamp on it telling the day the eggs were laid. He gets an extra price for his fresh eggs, and somebody said he was doing pretty well at it, but I do not know how long he will keep it up."

I know there is a lot of truth in what Mr. G. said. It is so around Medina, and it is so almost everywhere; but let me give you a plan by which you can *prove* that poultry will pay. Get half a dozen fowls to start with, and then grow chickens. Down in Florida, or even here in the North in the summer time, you do not need to invest any thing more except for feed. See what you can do by way of increase in just three or four months. In Florida, with a little incubator I increased from five to nearly a hundred in one winter. Here in Medina, during the past three months, with the aid of sitting hens (no incubator) I have hatched nearly one hundred chickens from the eggs laid by three choice pullets. The expense of feeding, especially where the fowls have a large range, is but a very small item compared with the value of the stock. When it comes cold weather, so that something must be invested in the way of winter protection, instead of undertaking to winter them suppose you just sell out for what they will bring during October and November. Very likely you will not make very great wages; but if you are obliged to be outdoors on account of health, as I am, I think you will find it quite a profitable investment all around. It is an easy matter to keep an account of what your stock costs, and the feed during the summer; and the fun of seeing the chickens hatch out is worth to *me* a "whole lot."

THE DECLINE OF BUCKWHEAT.

Probably few bee-keepers are aware that there has been a serious decline in the production of buckwheat as a farm crop in America. In 1866, which is the furthest back we can go for an authentic record, the area of land devoted to buckwheat was 1,045,000 acres, and the yield was 22,791,000 bushels. The value of the crop for

that year was \$15,413,000. At present the area in buckwheat is about 750,000 acres, with a yield of 14,500,000 bushels, valued at \$8,000,000. In former times Pennsylvania led the way in buckwheat production; but now she holds a secondary position to New York, which at present holds the banner.

Possibly adulteration had considerable to do with the fall of buckwheat in popular esteem; for until the passage of the national pure-food law it was generally mixed with any kind of dark flour which happened to be cheaper. Some people refused to buy the mixed goods; and if others did purchase the stuff, what they got was only half buckwheat at the most.

The demand for buckwheat flour is better than it used to be, and there is a big field for the grain in connection with poultry. For the latter it is an ideal feed, and has the merit of being easily grown. The probabilities are that buckwheat will rise to its former position. Bee-keepers could do much to help it to attain a higher position among the crops. There is plenty of suitable land for buckwheat in New England, New York, and Pennsylvania, and it is a pity that more of it is not grown.

W. K. M.

TEMPERANCE

A MINISTER WHO IS NOT AFRAID OF BECOMING UNPOPULAR BY SPEAKING THE TRUTH.

The following, by the Rev. U. S. Tabor, we clip from the *Manatee River Journal*, Florida, for May 22. Perhaps I should explain that the temperance people of Manatee Co. have lately organized what they call The Patriotic League, and this clipping is in regard to it:

You can generally count that the sheriff who goes around with the smell of liquor on his breath will not disturb the peace of anybody but a kinky-headed negro who is selling it. If he goes to search a drugstore he will wire the boys, "Look out! I'm coming! Get all the booze hid out."

This is a local-option county. More than once it has shown that a majority of her people did not want intoxicating liquors sold within her borders. Now, why have we had 29 persons with license to sell liquors in the county? Because the laws have not been enforced. And why have the laws not been enforced? Because the people of the county have not demanded their enforcement. And why have the temperance people not demanded their enforcement? Because there was no one to speak except private individuals, and they felt that their speaking would not produce results.

But suppose that all the people in this county were organized; and suppose that the president of that organization, representing hundreds of voters, the best men in the county, and hundreds of women—the good and true in all our churches and out of our churches—should demand of the officers of this county (in the name of the organization) that the laws be rigidly enforced, and assure that officer that these hundreds of the best people were back of him, what would be the result?

There would not be a blind tiger left to tell the tale; the whisky crowd would quit poking fun at us and saying, "Prohibition doesn't prohibit." If it does not, it is your fault and mine. Are you willing to act the part of a man, a patriot, and, as far as your powers go, with love to all and malice to none, stand as a soldier by the side of your neighbor for the enforcement of law? If so, join The Patriotic League of Manatee County.

My good friend, have you such a minister in your locality to stand up bravely for godliness and righteousness? Perhaps you have if some good man like yourself would show him this article and tell him you are ready to stand by him and back him up in the glorious work of putting down sin and Satan and holding up Christ Jesus.

"Practice Makes Perfect."

A little girl sat on her father's lap, looking into the mirror, and inquired if God made both her father and herself. Being assured that he did she remarked that he was doing better work than he ever did before.

It is simply the old adage over again, and it is true of *The A. I. Root Co.'s* Bee-keeping Supplies; and while perfection can never be attained they are as near perfection as improved machinery and years of practice can well make them. If you have never seen them, or if you have, and have not a catalog, send at once for my 40-page catalog, illustrated profusely, and giving prices of every thing used in the apiary. *It is free for the asking.* Special price list of shipping-cases, and all kinds of honey-packages—wood, tin, and glass. Send a list of what you will need at any time and let us tell you what they will cost you delivered at your station.

Cash or goods for wax at all times.

HIGHLAND FARM QUEENS

are the result of years of careful selection and judicious breeding from the best honey-gathering strains of superior long-tongue red-clover Italians in America and Italy. Highland Farm methods will produce perfectly developed, long-lived, and prolific queens. If you want bees that will winter well, build up rapidly in the spring, and roll in the honey, Highland Farm queens will produce them. We are now sending queens of this celebrated strain by return mail at the following prices:

	1	6	12
Select untested queens	\$.75	\$4.00	\$ 7.50
Tested queens	1.25	6.00	10.00
Select tested queens	1.50	8.00	15.00

Safe delivery and satisfaction guaranteed. Send for queen circular—it tells why Highland Farm queens are superior to others. Address all orders to

J. E. HAND, BIRMINGHAM, ERIE COUNTY, OHIO.

GRAY

CAUCASIAN

QUEENS.

1905-1906 Queen-breeder in Apiary of Dept. of Agriculture, Washington, D. C.

During that time Caucasians were being distributed by the department so that I handled many of the imported queens and bred much of the stock which other breeders are using, and am in a position to furnish the best of Caucasian queens. They are hardy and prolific, but not great swarmers; are builders of white combs, great honey-gatherers, and their extreme gentleness has won for them the name "STINGLESS." Queens are reared from imported mother of gray type. Have three-band or leather-colored Italians also. They are hustlers.

GRAY CAUCASIANS.		PRICE LIST AFTER JULY 1.		THREE-BAND ITALIANS.	
Untested queens	1, \$.75; 6, \$4.25; 12, \$ 8.00.	Untested queens	1, \$.60; 6, \$3.35; 12, \$6.50.	Untested queens	1, \$.75; 6, \$3.35; 12, \$6.50.
Select untested queens . . .	1.00 5.50 10.00.	Select untested queens . . .	.75 4.00 7.50.	Select untested queens . . .	.75 4.00 7.50.

SAFE ARRIVAL AND ENTIRE SATISFACTION GUARANTEED.

No bee disease ever in this section.

Descriptive circular and testimonials free.

LESLIE MARTIN, :: Birdcroft Apiaries, :: LEBANON, TENNESSEE.

ITALIAN QUEENS

And nothing but Italians. An improved superior strain is what QUIRIN-THE-QUEEN-BREEDER raises. Stock is Northern-bred and hardy—not a single colony lost during the past winter; have five yards, all wintered on summer stands. Am now taking off supers of nice white-capped clover honey. Prices of bees and queens as per below:

Prices of Queens after July 1.	1	6	12
Select queens	\$.75	\$4.00	\$ 7.00
Tested queens	1.00	5.00	9.00
Select tested queens	1.50	8.00	15.00
Breeders	3.00	15.00	
Straight five-band breeders . .	5.00		
Two-comb nuclei, no queen . .	2.25	12.00	22.00
Three-comb nuclei, no queen . .	3.25	18.00	32.00
Full colonies on eight frames . .	5.00	25.00	

All queens now go by return mail. Safe arrival and pure mating guaranteed. We employ 400 to 500 swarms. Can furnish bees on L. or Danz. frames. Add price of whatever queen is wanted to nuclei or colony. No order too large, and none too small. Over 20 years a queen-breeder. Address all orders to

QUIRIN-THE-QUEEN-BREEDER, Bellevue, Ohio.

ITALIAN QUEENS

Fine young prolific 3 and 5 banded Italian queen, untested, only 75c; extra-fine queen \$1; tested, \$1.25. Full colonies in 8-fr. hive, with queen, \$5.50; 3-fr. nucleus, with queen, \$2.75. Safe arrival guaranteed. Directions to introduce go with queen. Price list free.

J. L. FAJEN, ALMA, MO.

NOT CHEAP QUEENS. BUT QUEENS CHEAP

500 Best Strain Italian Queens Ready to Mail March 1st. Untested queens in lots as follows: 1, 75 cts.; 6, \$4.20; 12, \$ 7.80. Tested queens in lots as follows: 1, \$1.00; 6, \$5.70; 12, \$10.80. Breeders' queens in lots as follows: 1, \$5.00; 3, \$12.00. Nuclei with un'd queen: 1-fr., \$1.75; 2-fr., \$2.25; full colonies, \$4.75. Westwood Red-clover Queens

Are the bees that got the honey in 1907. Better try them for 1908. Nuclei and full colonies a specialty. Price list on application. **HENRY SHAFFER, 2860 Harrison Ave., Sta. L, Cincinnati, O.**

QUEENS of MOORE'S STRAIN OF ITALIANS

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardiness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the *Bee-keepers' Review*, Flint, Mich., says, "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, \$1.00 each; six, \$5.00; doz., \$9.00. Select untested, \$1.25 each; six, \$6.00; doz., \$11. Select tested, \$2.00. Extra select tested, \$3.00. Breeders, \$5.00 to \$10.00.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

J. P. Moore, queen-breeder, Rt. 1, Morgan, Ky.

ITALIAN QUEENS

Bred from best stock to be had in the country, and by best methods, insuring beautiful, vigorous, long-lived queens. Prices for 1908:

	1	6	12
Untested	\$1.00	\$5.00	\$9.00
Tested	1.50	8.00	15.00
Select tested	2.00	10.00	14.00
Breeder	5.00		
Two-frame nucleus	2.25	12.00	22.00
Three-frame nucleus	2.75	15.00	28.00
Full colony on eight frames	5.00	25.00	

Add queen wanted to above.

I shall offer no Caucasians for sale this season.

E. M. GRAVES, loamosa, San Bernardino Co., Cal.

W. H. Laws

says that, while his trade is very satisfactory, and about as large as he can handle, yet he does not want you who are new to him to forget that the very best of honey-gatherers and a square deal is what you will always get when you buy Laws queens.

You should try his strain of Red-clover Long-tongue Italians, one firm alone having bought over 3000 of the Laws queens in the past six years; and more than half the queens sold this season are sent to customers who have bought in former years. A long string of testimonials testify to their merits, and you will make no mistake in buying Laws queens.

Single queens, \$1.00; 6 for \$5.00. Some very fine breeding queens on hand. Safe delivery and satisfaction guaranteed at \$5.00 each. Address

W. H. LAWS, Beeville, Bee Co., Texas.

ITALIAN QUEENS BY RETURN MAIL OR MONEY REFUNDED

Warranted, 75 cents each, six for \$4.00; tested, \$1.50 each. Circular free.

GOLDENS, 10c.

Send 10 cts. (silver) for cage of living bees, **HARDY GOLDENS**, and examine before ordering, if you care to see the most beautiful race on earth. C Oscar Fluhrly, Sandusky, W. Va.

GOLDEN-ALL-OVER and RED-CLOVER ITALIAN QUEENS

My stock is the result of years of careful selection, and is equal to any in the country. The prices are only such as to insure long-lived, prolific queens, whose workers will be hardy and good honey-gatherers. Write for 1908 circular. PRICES.

	1	6	12
Untested	\$1.00	\$5.00	\$9.00
Select untested	1.25	6.50	12.00
Tested, \$1.75 each; select tested, \$2.00 each.			

Positively all orders filled in rotation.

Wm. A. Shuff, 4426 Osage Ave., Philadelphia, Pa

Long-tongued

Red-clover Queens

Bred by their Originator

Do you want to get some specimen queens of the world-famous red-clover stock of Italian bees? Then buy from me, because I am the originator, and surely ought to know how to breed them in their purity. When you get them from me you know you have the real strain. For years I have devoted time and skill to this stock, trying to reach perfection. I can submit many splendid testimonials in favor of this stock to show my work has not been in vain. Try them, and YOU will be pleased also. I endeavor to please the practical man looking for definite results in dollars and cents. Many years' experience as head apiarist of The A. I. Root Co. enables me to fill the most exacting order with complete satisfaction to the purchaser. Let me show you how well I can please you.

TRY SOME OF MY

RED-CLOVER AND GOLDEN QUEENS

Italian strain, untested, 50c each. Mailed promptly; safe arrival and satisfaction guaranteed. Send for prices of breeders and tested queens. M. BATES, Greenville, Ala., R 4, box 29.

TO LAND SELLERS

There is a continual demand for farms or ranches suitable for bee-keeping. If you have the right kind of place, and can satisfy us on that point, we are certain you can dispose of it to one of the 35,000 readers of GLEANINGS IN BEE CULTURE, by inserting a small advertisement in its pages.

There is no other medium by which you may reach the great constituency of bee-keepers. The cost of such an advertisement is small when compared with the results.

WRITE TO

THE ADVERTISING MGR. OF

MEDINA, OHIO

Convention Notices.

There will be a semi-annual session of the Nebraska State Bee-keepers' Association held in Lincoln during the State Fair. The meeting will be held on Wednesday evening, Sept. 2, at 7 o'clock, at the bee and honey house on the State Fairgrounds.

All bee-keepers in attendance at the fair should be present. There will be interesting discussions, exchange of practical experiences, and renewal of acquaintance. Come to the fair and see one of the best honey exhibits displayed in any of the central States, and enjoy a meeting of one of the growing State bee associations.

LILLIAN E. TRESTER, Sec.

Lincoln, Neb.

SPECIAL NOTICES

By OUR BUSINESS MANAGER

JAPANESE BUCKWHEAT.

We can supply seed in two-bushel lots and upward at \$1.50 per bushel, no charge for bags, although at this price we have very little margin. One bushel, \$1.75; half-bushel, \$1.00; peck, 60 cents, bag included in each case.

ONE-FRAME OBSERVATION HIVES AT A DISCOUNT.

We have a few one-frame observation hives, slightly shop-worn, which we offer at reduced price to close out before taking inventory. They are almost equal to fresh new goods. There are seven with surers, which we will sell at \$2.25 each, and two without surers, at \$1.90 each.

OUR ST. PAUL BRANCH.

Mrs. H. G. Acklin, manager of our St. Paul branch, is expecting to take an extended vacation, and has secured the co-operation of Messrs. Palmer & Pilcher, who will be permanently identified with this branch in the future. On my recent visit to St. Paul, adjusting the loss by fire, I met both gentlemen and can heartily commend them to our patrons of that office. While the care of bees was new to them, they were apt and capable, and were fast mastering the mass of details connected with the handling of supplies as well as the bees.

A HONEY-PUMP.

Some months ago there was described in these columns an outfit for bottling honey; and one of the items described was a small rotary pump that would raise honey from the receptacle where it leaves the extractor up into an elevated tank so that it would flow by gravity through the filling-pipe to the glass bottles and jars. We have been investigating pumps for handling liquid honey, and are prepared to offer the No. 1 Blackmer pump to run with a belt at \$25.00. This can be belted up to the same engine that runs the honey-extractor by putting a four-inch pulley on the opposite side of the engine from that which drives the extractor. For those who do not have an engine to drive it we can supply the Little Giant pump, with handle to work by hand, for \$20.00.

REVISED PRICES OF HONEY-EXTRACTORS WITH BALL-BEARINGS AND SLIP GEAR.

The addition of the letter "B" to old numbers indicates ball-bearings.

THE NOVICE EXTRACTOR.

In ordering odd-sized extractors, give outside dimensions of frames and length of top-bar.

- No. 4B.—For all frames 13 inches or less in depth and 13½ inches or less in width (wt. 50 lbs.) . . . \$10 0
- No. 5B.—For L. or Simp. frames standing on end, or any other frame not over 9½ in. deep or 18½ long, top-bar 20 in. (wt. 45 lbs.) . . . 9.50
- No. 7B.—For frames deeper than the L., but not over 11½ in. (wt. 60 lbs.) . . . 10.50
- No. 10B.—For deeper frames not over 13½ in. deep, or 18½ wide (wt. 60 lbs.) . . . 10.50

THE COWAN RAPID REVERSIBLE EXTRACTOR.

- No. 15B.—2-frame Cowan for L. frames; comb-pockets, 99% in.; diam. of can, 20 in. (wt. 80 lbs.) . . . 12.50
- No. 15BR.—2-frame Root Automatic reversing, with brake, size as above . . . 14.00
- No. 17B.—2-frame Cowan, for frames not over 11½ in. deep, 23 in. in diameter (wt. 100 lbs.) . . . 13.50
- No. 17BR.—2-frame Root automatic reversing, with brake, size as above . . . 15.00
- No. 18B.—2-frame Cowan for frames not over 12 in. deep, 24 in. in diameter (wt. 120 lbs.) . . . 14.50
- No. 18BR.—2-frame Root Automatic reversing, with brake, size as above . . . 16.00
- No. 20B.—2-frame Cowan, for frames requiring larger than 24-in. can . . . 16.50
- No. 20BR.—2-frame Root Automatic reversing, with brake, size as above . . . 18.00

The Root Automatic reversing device with brake is applied to 2-frame extractors, as in table above. This device can not be added to a Cowan, but the extractor must be made for it.

THE ROOT AUTOMATIC REVERSIBLE EXTRACTOR.

- No. 25B.—4-frame Root Automatic for L. frames, 28 in. in diameter (wt. 180 lbs.) . . . 25.00
- No. 25BP.—Same as above with power gear . . . 30.00
- No. 27B.—4-frame Root Automatic for frames not over 11½ in. deep, 34 in. in diameter (wt. 210 lbs.) . . . 28.00
- No. 27BP.—Same as above with power gear . . . 33.00
- No. 30B.—6-frame Root Automatic for L. frames, 32 in. in diameter (wt. 210 lbs.) . . . 32.00
- No. 30BP.—Same as above with power gear . . . 37.00

No. 37B.—6-frame Root Automatic for frames not over 11½ in. deep	37.00
No. 37BP.—Same as above with power gear	42.00
No. 40B.—8-frame Root Automatic for L. frames, 36 in. in diameter (wt. 210 lbs.)	40.00
No. 40BP.—Same as above with power gear	45.00
No. 47B.—8-frame Root Automatic for frames not over 11½ in. deep	46.00
No. 47BP.—Same as above with power gear	51.00

Other sizes built to order. Prices on application. Give outside dimensions of frame and length of top-bar, and number of frames you want to extract at one time.

In the foregoing list, B, of course, indicates that the extractor is fitted with ball-bearings. R indicates that the Root automatic is meant, and P indicates that the machine is fitted for power, and requires the use of an engine.

BALL-BEARING EXTRACTORS.

For some time we have been on the lookout for a good ball-bearing at a price low enough to enable us to use it in our honey-extractors without greatly increasing the price. We have now found what we have been looking for, and propose from this time forward to equip all our extractors with ball-bearings. This we can not do at the regular price; but the machines will be so much improved in durability and easy-running quality that you will be well repaid for the slight additional price. In addition to the ball-bearings we are arranging a slip-gear device on all most all hand-power machines, to enable one to throw the gears out of mesh and stop the crank from revolving the moment you stop applying power, and allow the reel to spin on its ball-bearings, throwing out the honey while you uncup the next lot of frames ready to put into the extractor. None of these improved machines are in the hands of our dealers, as we did not get them perfected in time for this season's trade. You must not expect the new features on any extractors you may order this season unless you especially request it or mention it in your order.

Special Notices by A. I. Root

UP-TO-DATE POULTRY-BOOKS, ETC.

Besides the poultry-book that we give away to everybody who sends \$1.00 (as mentioned in GLEANINGS for May 15), providing he sends 6 cts. for postage, we have the following up-to-date valuable books which we offer at half price to any one who sends \$1.00 for GLEANINGS and asks for no other premium, or any one whose subscription is paid up for one year or more. First we have two books, the regular price of which is \$1.00 each; to the subscribers of GLEANINGS, as mentioned above, 50 cents each, postpaid. The first of these books is:

Poultry-plant Construction, most profusely illustrated with plans for houses, diagrams, bills for material, and descriptions of the largest and most successful poultry-plants now running, including houses for ducks as well as chickens.

The second dollar book is entitled Successful Poultry-keeping. This is a book of 176 pages, 9x12, brimful of illustrations. It comprises the whole business in every department, from setting hens to caponizing.

Then we have the following books at 50 cents each:

Artificial Incubating and Brooding.

Poultry-houses and Fixtures, with a special department in regard to fresh-air or curtain-front poultry-houses.

The Chick Book; all about raising chickens; profitable broiler-raising, etc.

The Plymouth Rocks.

The Bantam Fowl.

The Leghorns.

The Asiatics.

Ducks and Geese.

Eggs and Egg-farms.

Besides the above 50-cent books we have also 6 more 50-cent books entitled Cyphers Series, as follows:

1. Profitable Poultry-keeping in all its Branches.

2. Profitable Care and Management of Poultry.

3. Profitable Poultry-houses and Appliances.

4. Profitable Egg-farming.

5. Profitable Market Poultry.

6. Capons for Profit, by T. Greiner.

The above 15 books are 50 cents each, but only 25 cents to those who send \$1.00 for GLEANINGS, or to any one whose subscription is paid up for one year or more; and if you find when you get any one of them that you do not care for the book at 25 cents, send it back and we will return the money. As we have only a limited stock of these books perhaps you had better order soon, and mention some other one in case the one particularly wished has been sold out. We have still a good stock of the book entitled Profits in Poultry, for which you may send 6 cents to pay for postage as described in GLEANINGS. This is a good-sized book that we give away, but it is not up to date like the others.

Well, something has lately come up about capons that may make this latter book especially valuable. The writer, in one

of the recent poultry-journals, says capons can be easily taught to take care of chickens just as well as the mother hen; and you can give them chicks from the incubator or take them away from the hens when hatched, and he will be just as good a mother as the mother-hen, and he will grow and get fat at the same time. The writer says he has repeatedly given a good-sized capon 30 or 40 chicks, and he says the capon would scratch and "cluck" for them and brood them as well as the mother. Greiner's book does not tell us any thing about this. Perhaps he did not know it. If his eye should alight on this will he please let us know? and if any of the rest of you have had experience in giving chicks to a capon as I have described I wish they would write me briefly in regard to it. If a capon can be made to receive and brood chicks it looks to me as if he would be ahead of a "fireless" brooder or any other kind. I am inclined to think there may be at least some truth in this, for I have seen a half-grown chicken adopt other small chickens, and care for them almost like their own mother.

Finally, we have quite a number of copies of a book called Reliable Poultry Remedies; or, the Causes, Symptoms, and Treatment of Poultry Diseases. Now, while I have very little faith in doctoring either chickens or human beings with drugs or medicines of any kind, I find this book exceedingly valuable in its hints about the prevention of diseases among poultry. A great many times, and I do not know but I might almost say the greater part of the time, when your fowls are ailing it is because of some carelessness or neglect on your part. This book will enable you to see almost at once where the trouble is.

The regular price of the book is 25 cents, or 13 cents only to the readers of GLEANINGS.

THE WRIGHT BROTHERS' FLYING MACHINE, AND OTHERS, UP TO DATE.

We learn by the papers that, some little time ago, Wilbur Wright, the elder of the brothers, while making some experiments in flying, was pretty severely burned by the escaping steam of the cooling-coils of his engine. He said, however, he was not hurt, and to prove it he walked half a mile or more to his stopping-place; but as we go to press we learn by the *Woman's Daily* that the hurt was more severe after all, and will probably interfere with some of their plans for flights over in Europe. It is just like my good friend Wilbur to say he was not hurt, even when suffering severely, and we hope and pray that he may soon be fully recovered.

From the magazine called *Aeronautics* we learn that De la Grange, on the 30th of May, made ten circles with his aeroplane, staying up in the air 15 minutes and 26 seconds. The distance covered was from 14 to 15 kilometers. As a kilometer is equal to about 3/4 of a mile, the speed made was about 40 miles an hour. Farnam has also made a successful flight, carrying a passenger, and afterward won the \$2000 prize by making a 20-minute flight of 15 miles.

The "June Bug," as it is called, has also made some very successful flights here in America, in one of them winning the *Scientific American* trophy. This flight was made July 4, and the machine made something over a mile, at the rate of about 40 miles an hour. We are further told that De la Grange has planned to arrive with his machine in the city of New York about the 20th of August, that Farnam is probably here by this time, and the prospect is that "something will be doing" now right speedily. In fact, it may be that something has already been done while I dictate these words.

CLASSIFIED ADVERTISEMENTS

Notices will be inserted in these classified columns at 25 cents per line. Advertisements intended for this department can not be less than two lines, and should not exceed five lines, and you must say you want your advertisement in the classified columns or we will not be responsible for errors.

Help Wanted

WANTED.—Man and wife for farm in Dutchess Co., N. Y. Man to have knowledge of bees. Address
B, Room 409, Evening Post Bldg., New York City.

Poultry Offers

A. I. Root's Bee-goods, Poultry-supplies, Seeds, etc.

STAPLER'S, 412-414 Ferry St., Pittsburgh, Pa

FOR SALE.—Write for prices on clover, basswood, and buckwheat honey in 60-lb. cans and kegs; also comb honey and beeswax, all guaranteed to be pure.

W. L. COGGSHALL, Groton, N. Y.

FOR SALE.—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts. J. P. MOORE, Queen-breeder, Morgan Ky.

FOR SALE.—Choice white extracted honey, mostly clover and raspberry mixed, in new 60-lb. cans. Price on application. Sample, 10 cts. JAMES McNEILL, Hudson, N. Y.

FOR SALE.—2000 lbs. white-clover honey, mostly comb, heavy, well ripened. What am I offered? J. M. MOORE, Holden, Mo.

FOR SALE.—About 7000 lbs. of fine extracted white and alsike clover honey, in 5-gal. square tin cans, 2 to box, at 8 cts. per lb., f. o. b. C. M. BUTT, JR., Viriopia, Wis.

FOR SALE.—1908 crop of Northern Michigan red-raspberry and clover honey; heavy body, light color, fine flavor. Price \$10.50 per case of 120 lbs. (two cans). Cash with order. IRA D. BARTLETT, East Jordan, Mich. Box 156.

FOR SALE.—Our own production of comb honey, 4x5 plain sections, No. 1 quality, at 16 cts. per section. Our comb honey won every important premium in the State last year. If you have a place for some "gilt-edge" comb, write. E. D. TOWNSEND, Remus, Mich.

FOR SALE.—Clover and raspberry honey; also basswood honey; well ripened, rich body and delicious flavor; extracted from capped combs. Two 60-lb. cans (120 lbs. net), \$10.75. Ask for sample if a choice article will please. F. B. CAVANAGH, Boscobel, Wis.

FOR SALE.—150 cases of No. 1 comb honey, 15 sections in 3-inch glass, no-drip cases, 6 cases in a crate, very fine, at \$2.40 per case, f. o. b. cars here. Also 8000 lbs. clover and basswood extracted, in new 60-lb. cans, 2 in case, very heavy body and fine flavor, at 9c, f. o. b. cars here. Sample free. W. H. TOWNSEND, Hubbardston, Mich.

FOR SALE.—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 9½ c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order. LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

It is just as I expected! The bees are now, this 21st day of July, gathering basswood honey, and piling it on top of the raspberry. It will be raspberry and basswood honey mixed this year. Then about the time this August 1st GLEANINGS reaches you we will be extracting. Rich, ripe, and rosy will be the kind of honey I will have for sale this year. Some of it has been on the hive 60 days. Doesn't it make your mouth water to think of it! It will be put into bright new shiny 60-lb. cans that you can see your face in. I am asking 10 cts. a pound for this delicious honey—just a little more than it takes to buy the ordinary kind. Ask for a sample, and be convinced. E. D. TOWNSEND, Remus, Mich.

Honey and Wax Wanted

WANTED.—White ripe extracted honey; will pay cash. GEORGE RAUCH, No. 5343 Hudson Boulevard, North Bergen, N. J.

WANTED.—Comb, extracted honey, and beeswax. State price, kind, and quantity. R. A. BURNETT, 199 South Water Street, Chicago, Ill.

WANTED.—We are in the market for No. 1 white extracted honey in any quantity. Correspondence solicited. State kind, quantity, and price asked. We also have for sale 60-lb. honey-cans, 2 cans in case. Both cans and cases in A1 condition, at 30 cts. per case. MICHIGAN WHITE CLOVER HONEY CO., 31-33 Griswold St., Detroit, Mich.

Wants and Exchanges

WANTED.—Refuse from wax-extractors and old comb or cash ARCHIE COGGSHALL, Groton, N. Y.

WANTED.—Eastman Panoram kodak, No. 4. Will trade a 6½x8½ View outfit, or sell outfit and buy kodak. F. C. WOOD, Dola, O.

WANTED.—Refuse from the wax-extractor, or slumgum State quantity and price. OREL L. HERSHISER, 301 Huntington Ave., Buffalo, N. Y.

Breeding queens of pure Caucasian and Carniolan races—price \$3.00. Order from A. E. Titoff, Expert in Apiculture, with Russian Department of Agriculture, Kieff, Russia. Remit with orders. Correspondence in English.

GLASS HONEY-PACKAGES

HERSHISER JARS.

There is nothing handsomer made for exhibiting honey or for bottling for a fancy trade. We have recently put a large stock, not only here at Medina, but in Chicago, New York, and Philadelphia, from any of which points the jars are supplied at the following prices:

PRICE LIST OF HERSHISER JARS.

¼-lb. square Hershiser jars with aluminum cap, \$.95 per case of 2 doz., weight 10 lbs.									
1 ½	“	“	“	“	“	“	“	“	15 “
1	“	“	“	“	“	“	“	“	24 “
2	“	“	“	“	“	“	“	“	20 “
1 ½	“	round	“	“	“	“	“	“	14 “
1	“	“	“	“	“	“	“	“	24 “
2	“	“	“	“	“	“	“	“	18 “

We can also supply the square jars with cork stoppers, either in partitioned cases or in crates, including the corks, from any of the four points named, as follows:

5-oz. square jars in reshipping-cases, \$.80 per case of 2 doz.; \$3.25 per crate of 1 gross.									
1 ½	lb.	“	“	“	“	“	“	“	4.25
1	“	“	“	“	“	“	“	“	5.75
2	“	“	“	“	“	“	“	“	7.50

TAPER-PANEL JARS—1-2 and 1 lb. capacity.

This is a new jar which we are introducing this year, and we believe it is a winner. It has been made especially for us. The cap is a very neat and simple one, securely closing the jar honey-tight. At the low price for which we offer it, this jar should have a large sale. We have them packed only in reshipping-cases of two dozen each, ready to ship when refilled with honey, without additional packing.

½-lb.	Taper-panel jars in cases, \$.80 case; 6 cases, \$4 50. Wt. 18 lbs.
1-lb.	“ “ “ “ “ “ 1.00 “ 6 “ 5.70. “ 25 “

NO. 25 JAR. SIMPLEX JAR.

These are two popular jars of 1-lb. capacity, of which we have sold large quantities. For a year we were unable to get any more Simplex; but they are being made again; and while they are costing us more than they did, they are such a handsome jar that we have secured a further supply. The No. 25 jar we can furnish either with the porcelain top with lacquered band and rubber ring, or with lacquered tin cap lined with thick wax-paper wad. This latter style costs less than the

Simplex Jar.

other, and will not be subject to so much breakage in shipping. These are all packed in reshipping cases of two dozen each at the following prices:

Simplex jar, in reshipping-cases,	\$1.10	case; 6 cases,	\$6.30.	Weight	24 lbs.	per case.
No. 25 " porcelain top, "	1.10	" " " "	6.30.	"	25 "	per case.
No. 25 " tin top, "	.90	" " " "	5.10.	"	22 "	per case.

TIP-TOP JARS.

This is a reliable jar with glass top, rubber ring, and spring-top fastener. We have it in two sizes, holding $\frac{1}{2}$ and 1 lb., packed either in reshipping-cases or crates of one gross at the following price:

Half-pound Tip-top jars in reshipping-cases, \$1.00 per case of 2 doz.; \$5.00 per crate of 1 gross.

One-pound Tip-top jars in reshipping-cases, \$1.10 per case of 2 doz.; \$5.50 per crate of 1 gross.

HALF-POUND TUMBLER, NO. 12.

For a cheap glass package for half pound of honey the tin-top tumbler is very popular. We supply with these tumblers, besides the tin top, a wax-paper disk for sealing it tight when filled with honey. These are packed four dozen to case, or 32 dozen to barrel, at the following prices:

No. 12 half-pound tumblers, \$1.00 per case of 4 doz.; \$6.40 per barrel of 32 doz.

MASON FRUIT-JARS.

These are very largely used for canning fruit, and are often used for honey as well. As we buy them by the carload, we can make the following prices at Medina, all put up complete with porcelain-lined caps and rubbers, in cases of 1 doz.

Pint size . . . dozen,	62c;	6 dozen,	\$3.50;	12 dozen,	\$6.75.
Quart size . . . "	65c;	6 "	3.60;	12 "	7.00.
Half-gallon size, "	85c;	6 "	4.85;	12 "	9.50.

Triumph wrenches for Mason jars, 15c each; by mail, 20c.

All glassware shipped in original packages is furnished as put up at the factory by experienced packers and should reach destination in fair condition. We decline to be responsible for breakage. Should there be an excessive amount of breakage, report the case, giving particulars, and we will present the matter for adjustment to the factory.

STURWOLD'S SHOW-CASE.

This case is 28 inches high and 20 inches square, outside measure, top and bottom. The glass of which it is made is 16x24. The case is to be set up in any grocery, drugstore, or any other place of business where you want your honey exhibited or sold. The frame is of chestnut, filled and varnished, and finished in natural grain. Price, plain, \$5.00; with name and address, \$5.50. As the glass is very apt to be broken in transit, we will ship them, if you prefer, with glass boxed separately, at the same price. In flat, no glass or finish, \$2.50; glass included, \$4.00.

SAMPLE MAILING-BLOCKS.

Price 6 cts. each; by mail, 8 cts.

These conform to the postal regulations for mailing liquids.

A small wide-mouthed bottle with cork is enclosed in a screw-top case. Requires three cents postage when mailed filled with honey. Used for submitting samples of extracted honey.

SHIPPING-CASES.

In packing your comb honey for market do not injure your chances of selling at top prices by using poorly-made shipping-cases. Separate your honey into grades. The best will bring enough higher price to pay you well for your time in sorting, and you will be building a reputation for reliability and square dealing which will greatly assist you in making future sales. Having graded the honey carefully use neat, bright, well-made cases to pack it in. For list of our cases see our general catalog. For one cent a case extra we furnish cases with sliding cover and corrugated paper sheet for bottom of case, which saves breakage in shipping. In shipping small lots by freight pack several cases into a carrier with hay, straw, or other spongy material underneath to take the jar when handled roughly.

JAMESTOWN, N. Y.

PORTER BEE-ESCAPES

HIVE ESCAPE

When taking off surplus this is the greatest saving device. It does away with the shaking of the heavy supers, the cruelty of excessive smoking which causes the bees to uncap their honey and start robbing. Just tip the super to the angle of 45 degrees and insert the board. In a few hours it is free of bees; then take off your super. You can as well afford to be without a smoker as without the Porter Bee-escape.

PRICES

Each, 20 cts.; dozen, \$2.25; postpaid. With board, 35 cts. each; \$3.25 per 10; by express or freight.

TESTIMONIALS

They are perfect in action.—British Bee Journal.

No bee-keeper can afford to be without them.—Prof. Cook in American Bee Journal.

Worthy of highest commendation.—Eugene Secor, judge on awards, World's Fair, Chicago.

I would not do without them even if they cost five dollars apiece.—W. Muth-Rasmussen, Independence, Cal.

They are absolutely perfect. I can not tolerate my own make since using them.—John S. Reese, Winchester, Ky.

They are one of the best things ever brought into any apiary, and should be used in every bee-yard in the whole world.—Wm. McEvoy, Foul-brood Inspector, Ontario, Canada.

There is no robbing or fighting or disturbance in the apiary when the surplus honey is taken off with them. They are simply perfect.—W. Woodley in British Bee Journal.

HOUSE ESCAPE

To be used over the doors and windows in the extracting-house, or any place you wish to clear of bees. The most persistent robber can not return. Some bee-keepers make a practice of taking off the filled supers and stacking seven or eight in a pile. The Porter Honey-house mounted on a board makes the best kind of escape. Don't wait till to-morrow before you get a supply. You can not afford to be without them longer.

PRICES

Each, 25c; dozen, \$2.75; postpaid.

TESTIMONIALS

The Porter bee-escape clears the supers of bees so perfectly and quickly and easily that it makes the taking off of honey a pleasure instead of a dread as in former years.—G. M. Doolittle, Borodino, N. Y.

The removal of full honey-boxes has become an amusement since we began using the Porter bee-escape.—Ed. Bertrand, Editor Revue Internationale d'Apiculture, Nyon, Switzerland.

This number of the Review contains more unqualified praise of the Porter bee-escape than any other issue has ever contained of any other implement; but so long as it is deserved, who cares?—Bee-keepers' Review.

They are the greatest thing on earth for expelling bees from supers.—G. J. Flansburg, South Bethlehem, N. Y.

I would not be without them for four times what they cost.—Dr. W. A. Tufts, Musson, La.

Undoubtedly the best bee-escape is the one invented by R. & E. C. Porter.—W. S. Pouder, Indianapolis, Ind.

Bee-men are certainly behind the times if they can afford to use them and do not.—M. H. Mendleson, Ventura, Cal.

FOUR GREAT SPECIAL NUMBERS

SEPTEMBER, OCTOBER, NOVEMBER, and DECEMBER, 1908

A second great enlargement and improvement. With the June issue The Guide to Nature commenced its second era (of three months) with so many improvements as to surprise delightfully every patron. Beginning with the September number there is another decided advance, and the numbers for September, October, November, and December will eclipse all previous efforts in value and interest to readers.

There is to be a new and beautiful cover, and many other mechanical improvements. We have in hand and there are promised a large number of interesting articles and expressive photographs. Several new features which we are not yet free to announce are in preparation. The September number will surprise and delight.

It has taken a few months to "find ourselves." But we can tolerate the delay in the satisfaction that we are doing the "finding." It takes a little time to get under full headway. By the September issue we shall have had that time.

The magazine just as it is in June, July, and August is of higher grade than any other nature magazine ever published. It fits the present increasing interest. We have full confidence that those who know the magazine agree with that statement.

Neither the Prospectus nor any form of announcement can fully portray the merits of the magazine. We ask a fair trial and your hearty co-operation. Let the magazine speak for itself, and let us have the benefit of your suggestion and criticisms.

Single copy—15c. One year—\$1.50. Less than one year at single-copy rates, with the exception that, to new subscribers only, is offered a four months' trial for 50c.

READ WHAT EXPERTS SAY OF IT

The Christmas mail brought me what is probably as useful and beautiful a Christmas present as I ever received—a morocco-bound copy of the new edition of the A B C and X Y Z of Bee Culture. Bee books and journals have come to my desk of which it seemed as though the least said the better. Not so with this book. On the contrary, it seems as though words were lacking to do it justice. There are many other bee-books, each filling its niche, but, in all the world, there is nothing so comprehensive as the A B C and X Y Z of Bee Culture. There is no point in the wide domain of apiculture that is not touched upon in this volume, and the information is the very latest and most authentic, well written and well illustrated. The amateur and the expert are both served equally well.—W. Z. HUTCHINSON, editor and proprietor of the *Bee-Keepers' Review*, and author of *Advanced Bee Culture*.

No bee-keeper's library can be at all complete without a copy of this magnificent apiarian work. It has reached a sale of over 100,000 copies already, being the most largely sold book on bees in the world. Better send to us for a copy to read during the long winter evenings.—*American Bee Journal*.

This work of 536 pages is, as its name implies, a complete cyclopædia of everything pertaining to bees and bee-keeping. It was originally compiled by A. I. Root, who in the 1877 preface, after stating his indebtedness to Langstroth, Quinby, and others, says that "A great part of this A B C book is really the work of the people, and the task that devolves on me is to collect, condense, verify, and utilize what has been scattered through thousands of letters for years past." Since the first copy of this work appeared, now thirty-one years ago, it has undergone many revisions, and has had many additions, both of letterpress and illustrations, while the rapid advancement in bee culture has made it necessary in many cases to remove whole articles and rewrite them entirely. The revision has been ably carried out by E. R. Root, the present editor of *GLEANINGS*, who has had the assistance of a number of well-known and able men. In the preface the names of the writers of the different articles are given. For instance, we find Dr. C. C. Miller writes on honey-comb and out-apiaries; Dr. E. F. Phillips on the eye, parthenogenesis, and scent of bees; E. R. and H. H. Root on wax and wintering, both of these having carried out a number of experiments on these subjects. There are also articles by W. K. Morrison and Mrs. Comstock. It seems almost superfluous to say any thing about a book of which already 100,000 copies have been sold; the simple fact speaks for itself that it fills a want, and is an attestation of its worth. Among the articles that have been revised we find the new methods of queen-rearing described, so that the practical bee-keeper will have the latest and best ideas on the subject before him for reference. The new methods of wax-production are treated in an exhaustive manner; and as this subject is of more importance than formerly, greater space has been devoted to it. We have nothing but good words for this work, and recommend our readers to get a copy of the 1908 edition. The work is profusely illustrated and beautifully printed, and is a credit to the publishers.—By T. W. COWAN, Esq., editor of the *British Bee Journal*. Mr. Cowan is the author of two first-class books on bees and bee-keeping, "The Bee-keeper's Guide" and "The Honey-bee."

Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

EASTERN GRADING-RULES FOR COMB HONEY.

FANCY.—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

NEW COMB-HONEY GRADING-RULES ADOPTED BY THE COLORADO STATE BEE-KEEPERS' ASSOCIATION.

No. 1 WHITE.—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

No. 1 LIGHT AMBER.—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separated honey to average 21 pounds net per case of 24 sections; no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

No. 2.—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separated honey to average not less than 19 pounds net.

Cases of half-separated honey to average not less than 20 lbs. net per case of 24 sections.

Cases of unseparated honey to average not less than 21 lbs. net per case of 24 sections.

INDIANAPOLIS.—The demand is good, but prices very irregular and unsettled. Producers are offering fancy white comb as low as 12 cts., and white-clover extracted in five-gallon cans as low as 7 cts. Amber grades are not mentioned here at present. Beeswax remains steady at 28 cts. cash and 30 in exchange for merchandise.

Indianapolis, Aug. 5.

WALTER S. POWDER.

SAN FRANCISCO.—Spot prices quoted by packers on honey are unchanged. The crop is being gradually gathered, and considerable new honey has been marketed. White-sage honey is very scarce this year. Stocks are light, and there is a good demand both here and in the East. In view of the shortage, little change in prices is anticipated. Water-white comb, per lb., 16 to 17; white, 15; water-white extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 5¼ to 5¾; candied.

Aug. 1.

Pacific Rural Press.

ZANESVILLE.—Some native honey is now arriving on this market; and, while the demand is by no means heavy, yet the movement is more satisfactory than would be naturally expected in view of the general business depression. For No. 1 to fancy comb the jobbing trade is offering 12 to 13 cts. on arrival. The market is still unsettled, though there is a tendency toward lower prices. So far the demand for extracted is confined almost entirely to small retail packages. Beeswax is in some demand in a retail way. For good yellow beeswax 1 am offering 28 cts. in cash or 30 in exchange for bee-supplies.

Aug. 7.

EDMUND W. PEIRCE,
Zanesville, O.

CINCINNATI.—Quite a number of shipments of fine honey are now coming in, but prices are ruling lower than last season. In fact, we have never seen buyers so disinterested in a new crop of honey. We are offering the choicest at 14 and 15 by the single case. The demand for extracted honey is dull, which we attribute to the lack of activity in the business world; and, secondly, this is one of the dullest months in the year. We are selling amber extracted at 5½ to 6½ according to quality and quantity purchased. Fancy white extracted honey brings from 7 to 9 cts. Beeswax is somewhat easier, and we are paying 27 cts. cash and 29 in trade, delivered here. The above quotations on honey are the prices at which we sell—not what we are paying.

July 21.

THE FRED W. MUTH CO., Cincinnati, O.

KANSAS CITY.—There is quite a supply of native honey coming to market, prices ranging from \$3.25 for fancy white to \$2.75 for amber and off grades, the demand being for only the best qualities. There is a little demand for extracted at 7½.

Aug. 3.

C. C. CLEMONS & Co.

BUFFALO.—New honey is arriving now quite freely. Quality is very good. Buyers seem slow to buy. They are holding off for lower prices. In order to get it to moving, prices must go lower. No. 1 to fancy white-clover comb, 14 to 15; No. 2 ditto, 10 to 12; No. 3 ditto, 9 to 10; white-clover extracted, 7 to 8; ditto amber, 6 to 6½. No dark honey is arriving. Beeswax, 28 to 30.

Aug. 11.

W. C. TOWNSEND.

CINCINNATI.—There is an abundance of comb honey arriving daily, but no demand for it. We can give no other reason than, perhaps, hard times. People do without it. There is a fair demand for extracted white clover, which is selling at 7½ to 8. Amber in barrels is selling at 5½ to 6. Beeswax, light demand, is selling at 33.

July 22.

C. H. W. WEBER, Cincinnati, O.

PHILADELPHIA.—This has been unquestionably the greatest honey season we have had in the East for a quarter of a century. The first lot, of 3000 lbs., arrived in Philadelphia on the river boat yesterday, and was offered at 10½ for the amber and 12½ for white, no other sales being made. The market is not as yet established; but we are looking for low prices. Beeswax is firm at 28.

July 24.

WM. A. SELSER, Philadelphia, Pa.

DENVER.—We are entirely closed out of comb honey, and ready to receive consignments of new-crop comb, the first arrivals of which should move quickly at good prices if fancy stock. Extracted honey is in fair demand. We quote white extracted, 8 to 9; light amber and strained, 6½ to 7½. We pay 25 for clean yellow wax delivered here.

July 23.

THE COLORADO HONEY-PRODUCERS' ASS'N.,
F. Rauchfuss, Manager.

BOSTON.—Fancy white comb honey, 17; No. 1 white comb, 16; California white sage, extracted, 9; California light amber, 8; Southern honey in barrels, slow sale, 5 to 6.

July 1.

BLAKE-LEE CO., Boston, Mass.

LIVERPOOL.—Honey is steady. Market prices are fully maintained. Chilean extracted, 4 to 6; Peruvian, 3½ to 5½; California, 7 to 9; Jamaican, 4 to 5; Haiti, 5½ to 6. Beeswax is quoted, African, 29; American, 30 to 33; West Indian, 29 to 32; Chilean, 30 to 36; Peru, 33 to 34; Jamaican, 33 to 34.

July 18.

LYONSVILLE, MASS.

Reasons for the Price

OF MY

Raspberry Honey.

I ask ten cents a pound for my raspberry honey. This is slightly above the market price, but there are reasons.

In the first place, very little raspberry honey is produced. It is a novelty—something out of the ordinary—like orange-blossom honey for instance.

In addition, it is of very superior quality; so much so that it was awarded the gold medal, in competition with other honeys, at the Jamestown Exposition. It has a flavor all its own—a flavor that smacks of the wild red raspberry of the woods.

Another most important reason why I should get a good price for my honey is the manner in which it is produced. It is left on the hives for weeks after it is sealed over, and thus acquires that finish, that smooth, oily richness, that thick, rich deliciousness that can be obtained in no other way.

It costs more to produce such honey, there is not so much of it,

and it is worth more than the ordinary honey; just as big Northern Spy apples, streaked with crimson and filled with juicy spiciness, are worth more than ordinary fruit.

As a finishing touch the honey is put up in bright new 60-lb. tin cans, securely boxed, and the boxes bound with iron so that they will bear shipment; in fact, I will guarantee safe arrival in perfect condition.

For a single 60-lb. can the price is \$6.25; for two cans in a case (120 pounds) the price is \$12.00 a case, regardless of the number of cases that are taken.

If you are not acquainted with this honey, send me ten cents and I'll mail you a generous sample, and the ten cents may apply on the first order that you send.

BANKING BY MAIL

We will pay you 4 per cent—compounded twice a year on your savings account whether large or small—secured by assets of over 700,000. Send to-day for particulars explaining how you can open an account safely and conveniently by mail.

Under ordinary circumstances all or any part of your deposits may be withdrawn at will.

Send for the booklet to-day.

**THE SAVINGS DEPOSIT
BANK COMPANY**

MEDINA, OHIO

CHOICE QUEENS

ITALIANS AND CARNIOLANS.

1 untested, 75c; 12, \$7.50. 1 tested, \$1.00; 12, \$11.00.

1 selected tested, \$2.00. 1 breeder, \$3.00.

Nuclei, full colonies, and bees by the pound at low prices.

CHAS. KOEPPEN, Fredericksburg, Va.

Taylor's Strain of Italians IS THE BEST.

Long tongues and goldens are the best of honey-gatherers; 19 years a specialty, breeding for the best honey-gatherers. Untested, 75 cts. each, or \$8.00 a dozen; tested, \$1.00 each, or \$10.00 a dozen; select tested, \$1.50 each. Breeders, the very best, from \$3.00 to \$5.00 each. We sell nuclei in full colonies. Bees in separate yards. Safe arrival guaranteed. Send all orders to

J. W. TAYLOR & SON, Beeville, Bee County, Texas.

BEE READY!

Do you know, Mr. Bee-man, that there will be a fall flow again this year? Remember how you got left last year by getting caught without supplies? I have Root's goods by the carload and can get them to you sooner than the "other fellow." Free catalog.

E. W. PEIRCE, ZANESVILLE, O.

Italian Queens

GOLDEN AND CLOVER STOCK.

Choice queens, 75 cts. each; six for \$4.00, or \$7.50 a dozen

GEO. W. BARNES, Box 340, Norwalk, O.

ITALIAN QUEENS

Large prolific queens of the Moore strain. Nice to handle, and good workers. Untested, 60c; 6 for \$3.25; doz., \$6.00, now going by return mail. **S. F. TREGO, Swedona, Ill.**

HARDY GOLDENS!

Yes, I have them, and they are hardy—winter well, very gentle, and extra good hustlers. I know many goldens are the reverse of all this. I also know why, so do the breeders who sell them. My prices are high; but, every thing considered, they are cheap (see June 15th issue). I sell 20 goldens to one of any other race. Untested queen, \$1.00; select tested, *guaranteed*, \$2; tested, 3-band, \$1. **C. Oscar Fluharty, Sandusky, W Va**

CARNIOLAN, BANAT, AND CAUCASIAN QUEENS

Home-bred, \$1.00 each; five at 80c each; Imported, \$4.00 each.

FRANK BENTON, - Box 17, - WASHINGTON, D. C.

RED-CLOVER QUEENS

200 lbs. honey from my breeding colony. Mostly red-clover honey. Untested queen, 65 cts.; tested, \$1.00; doz., \$7.00. Four-frame nuclei and fine tested queen, \$4. **G. Routzahn, Biglerville Pa.**

TRY SOME OF MY RED-CLOVER AND GOLDEN QUEENS

Italian strain, untested, 50c each. Mailed promptly; safe arrival and satisfaction guaranteed. Send for prices of breeders and tested queens. **M. BATES, Greenville, Ala., R 4, box 29.**

**"A cent to
two cents
per pound
extra."**

A prominent and reliable commission merchant was looking at two different lots of honey of about the same grade standing side by side, only one lot was packed in "Root Quality" cases. He remarked that he could sell the honey in the Root cases for a cent to two cents per pound EXTRA because of the attractive appearance the *case gave the honey.*

The difference in cost in packing honey in the "Root Quality" case or in the no-quality kind is from *one-eighth to one-twelfth* of a cent per pound. You can't afford to use other than the *best.* We sell "Root Quality" cases in Michigan. Order now.

**M. H. Hunt & Son,
Lansing, .. Mich.**

WHAT'S THE USE OF HAVING FINE HONEY IF IT IS IN POOR PACKAGES?

If you are among the fortunate ones who have secured a good crop of honey, surely you will not be so unbusinesslike as to sell it in second-hand or inferior cases. Your honey will sell far easier in nice new cases or tins. **WE HAVE THEM.**

John Nebel & Son Supply Co., High Hill, Mont. Co., Mo.

BEE KEEPING will be a profitable industry this season.

Honey is high—short crop last year. The shortage of the honey crop for 1907 in the United States warrants bee-keepers to increase their colonies. About a half crop was produced, and in California, where the cheap honey comes from, only a quarter of the average crop was produced.

Get Ready Now for More Honey

Let us send you our catalog. We are manufacturers and sell only our own make of bee-supplies. Minneapolis is the largest lumber-distributing point; the Mississippi river furnishes us power, and our organization and labor conditions are the best for economical production. Send us an estimate of your requirements and let us give you prices. We have a large stock of standard bee-supplies on hand.

Dovetailed Hives, Sections, Section-holders, Separators, Brood-frames, Comb Foundation, Smokers, Extractors, Shipping-cases, etc.

TO THE BEE-KEEPERS of CANADA.

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the QUALITY. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, "The best is cheapest."

"If goods are wanted quick, send to Pouder."
Established 1889

THE PERSONAL ELEMENT IN BUSINESS

By the Bee Crank.

The big corporations of the day are like monstrous machines in which men are only cogs in a wheel. When a court of justice undertakes to discipline them it finds difficulty in locating personal responsibility on any one, from president to office boy.

My bee-supply business is not run in this way. True, I do not do every thing myself. I am fortunate in having competent assistants. But I keep in touch with every transaction, and you may be sure that your order, whether large or small, receives my own personal attention.

This explains why "If goods are wanted quick, send to Pouder," you get them quick. If you have experienced the other kind of service and believe, as hundreds of my patrons do, that the personal attention of the man you deal with is worth while, send me your next order as a trial.

I have a full line of Root's standard goods in stock, ready for immediate shipment. I sell them at factory prices and give you Pouder service. Just now the demand is for shipping-cases, sections, and honey-jars, and I am prepared.

Better send for my catalog if you haven't it. If more convenient, order from Root's.

Beeswax.—I have a large demand, and can use all you have to spare at 28 cents cash or 30 cents in trade, delivered here.

Hoosier-Italian queens, reared during the warm honey season. Untested, 75 cents each; select untested, \$1.00.

WALTER S. POUDER, Williamsburg, Ind.
Dear Sir:—I earnestly hope the foul-brood measure will become a law. It would be a great thing for Indiana, and I would feel like taking hold of the business in a much more earnest way. I have taken nearly 2000 pounds of comb honey from 18 colonies this season, and the bees are Walter S. Pouder's Hoosier-Italians. Truly yours, THOMAS A. OLER.

Walter S. Pouder,

513-515 Massachusetts Avenue, Indianapolis, Ind.

NO. 16

STRAY STRAWS

DR. C. C. MILLER

R. F. HOLTERMANN thinks it important that no young brood be present where a queen is to be introduced, p. 932. In Germany the opposite view is held. Which is right? [Who else has any thing to offer on this question?—Ed.]

WHEN BEES put burr-combs between two supers of sections they are generally of pure white wax; but sometimes I find them quite dark, when, so far as I know, the sections above and below are all right. Do the bees bring up dark wax from the old brood-combs, conclude it's too bad to darken the pretty sections, and end by dumping it between the supers?

A YIELD of 174 sections from a single colony before the close of July is something that doesn't happen every year "in this locality." This year it has happened, and the bees are still pegging away as if doing their best to kill us with work. We're still alive. [This would indicate, doctor, that you have had a good season. If one of your best colonies gives a yield of 174 sections, your average must have been high. Would you be kind enough to tell us what it was?—Ed.]

DR. S. P. SCHROEDER thinks he has positive proof that the bees and not the queen do the killing of the other queen. Over a brood-chamber was an excluder, then an extracting-chamber covered with wire cloth, over which was a nucleus which reared a young queen. After the young queen had been laying a week or more the wire-cloth was replaced by an excluder. The next day he looked for her, but she lay dead on the upper excluder. Most certainly in this case the queen was killed by the bees, for the queens could not get within several inches of each other. Pretty clear proof. [The proof here is quite conclusive. We should be glad to hear from any others who have been able to make any accurate observations on the point.—Ed.]

EVER NOTICE that bees are more particular about the combs they put brood in than about those they put honey in? Give a colony a comb which is so bad that it is a question whether it will be accepted at all, and the bees will first use it for honey, and afterward for brood. Does the honey help to soften the comb? Even foundation is often drawn out and used for honey before being used for brood. Colony No. 101 had distinguished itself as a honey-producer, and I wanted a freshly built comb of brood from that colony to start queen-cells from. If I gave an empty frame it would be mostly filled with drone

comb. So I gave a frame filled with worker foundation. It was promptly drawn out and filled with honey, but not an egg was laid in it till 15 days after it was given. [Yes, we have noticed just what you have described.—Ed.]

LATELY I've been taking a lazy way to introduce queens. Instead of putting the caged queen between the brood-combs or over the top-bars I just stick the cage in the entrance. Then after leaving her fast in the cage for three days I take out the cage and uncover the candy so the bees can let her out. That's much easier than to open the hive to get at the cage, especially if there are four to six supers on the hive. Then at any time I can easily see whether the queen is out of the cage, for it occasionally happens that a queen stays in the cage for days after the bees have eaten out the candy. Then, too, there may be some advantage in the position of the cage, for Mr. Doolittle has told us something to the effect that the bees feel the presence of a caged queen more if she is caged near the entrance. At any rate, I have tried it in at least eight cases, and it worked all right. [We believe this plan is all right, and may be safely practiced in the case of medium-priced queens.—Ed.]

YEARS AGO, on hot days my bees hung out in great clusters. Just been down to the apiary, this July 30, 11:30 A.M., with the thermometer 93 in the shade, and not a single colony hanging out. Entrances are much larger now than formerly, super-room more abundant, and there is ventilation at the top of the hive back of the super. Don't know of any thing else to account for the difference.

2:40 P.M. Thermometer now 99 in the shade, but not a colony hanging out. [More and more the evidence is accumulating, to the effect that top and bottom ventilation in the height of a honey-flow as here described may be profitably used in preventing the clustering-out and keeping all the bees at work. It used to be said that top ventilation of a super should not be tolerated for a moment; but so many of our good men have found to the contrary that we may well stop to consider whether the old dogma should not now be laid aside. In this connection, also, more and more proof is coming in that a large entrance during the height of the honey-flow is an advantage, although there are some good bee-keepers who claim that the old entrance, $\frac{3}{8}$ inch deep, is amply large.—Ed.]

IN POOR SEASONS I've often known a bait section in a super to be filled and other sections untouched. This year it happened in a flood of honey. A weak stray swarm took possession of some idle combs. I straightened it out and gave

it a super with a bait comb. It filled the bait and sealed it before touching the other sections.

OPINIONS differ as to whether a colony will swarm out with a virgin on her bridal trip and never return, leaving the colony queenless. This year No. 25 sent out a swarm, and I had reason to know that it had a virgin queen. I hived the swarm, gave it a frame of brood, set it on top of its old hive, and when the queen began laying I united it with the colony below, which had remained queenless. No. 97 swarmed out in the same way, and clustered on a tree. I knew it must have a virgin, but I left it to its own devices. In a quarter of an hour—may be half an hour—it returned of its own accord, although part of the cluster remained till the next day. No. 69 did about the same thing. Query. If I had not hived No. 25, would it have returned of its own accord, or would it have left for parts unknown? Please understand, in each of the three cases it was not merely a small escort accompanying the queen, but a rousing big swarm. [Your experiment seems to favor the view that a swarm will not go off, leaving nothing in the way of a queen or cell in the parent hive. Has any one else any positive evidence to offer on the subject?—Ed.]

EDITORIAL

By E. R. ROOT.

A BEE-KEEPER'S DICTIONARY.

THE *American Bee-keeper* has expressed the opinion that there would be a demand for a bee-keeper's dictionary. Mr. W. K. Morrison, of this office, has carefully compiled such a volume, adding a lot of lately coined words as well as all those in current use in various parts of the country among bee-keepers. It has been off the press now for nearly a year, and is filling a long-felt want.

A HIVE-LIFTING WHEELBARROW.

ON page 997 we present drawings of a hive-lifting wheelbarrow which we believe might be made very effective, although we have never tried it. But the trouble is, that many bee-yards are located on uneven ground, where it would be impracticable to use an outfit of this kind. Some apiaries are located in back yards, where the room is very limited. In these the hives would necessarily have to be arranged so close together that it would be impossible to use a wheelbarrow of any kind.

BE CAREFUL TO WHOM YOU SELL YOUR HONEY.

THE season for marketing honey has begun. While it may seem like an unnecessary repetition, we desire again to caution you to be careful to whom you send your honey. When you sell for cash, be sure that your man is responsible. If you can not learn any thing about him, you had better sell on commission; for then he can be held liable if he takes your honey without rendering you returns. But he may make very meager returns, and delay making payment. So we advise you not to trust any one unless he has a good rating and a reputation for dealing on the

square. Better take a little less price, and deal with a man of known reputation.

EXTRA-YELLOW ITALIANS REPORTED GENERALLY CROSS.

WE are getting complaints from all over the country, to the effect that extra-yellow bees are much crosser than the old-fashioned hybrids of blacks and Italians. This has been our experience year after year; but, strangely enough, we are compelled to furnish this yellow stock because the trade will have it, in spite of its bad temper and also its lack of hardiness. While there are some strains of extra-yellow blood that are gentle and hardy, they are the exception. So far as experience has shown us, there is nothing better than the old-fashioned leather-colored Italians; and we are inclined to believe that a little admixture of black blood improves them for honey.

A VISIT FROM A RUSSIAN GOVERNMENT OFFICIAL.

WE had the pleasure of a visit from Mr. Dmitry Arcibasheff, manager of the Farm Implement Bureau of Ministry of Agriculture of St. Petersburg, Russia. He was accompanied by Mrs. Arcibasheff, and the two were making a rapid tour through the United States, stopping off but a few hours at Medina.

We found Mr. and Mrs. Arcibasheff very intelligent and interesting people. They were gathering data on the subject of bee culture with a view, probably, of carrying it to Russia.

The Russian government has already taken a lively interest in the general subject of bee culture. It was only recently that it appointed Mr. Abram Titoff as apicultural expert with headquarters at Kieff.

BOUNTIFUL RAINS AND DROUTH.

WE have been having some bountiful rains in this locality. Only once had we begun to feel the pangs of drouth; but that was almost immediately followed by a long and copious rain. White and alsike clovers are still out; for every time we get a rain like those we have been having, it seems to start the blossoms out again.

A recent trip through Southern Michigan showed that that State had been suffering from a severe drouth; and we observed that, along the line of the Pere Marquette Railway, the grass had been burned down; and as the train whizzed by, every now and then we could see the burning fences or burning grass. The crops, too, were beginning to show a lack of rain. Reports show that there is drouth in many parts of the country.

THE HONEY-MARKET SITUATION.

VERY little has developed new other than as reported in our last issue, page 930, except that quite a number of discouraging reports have come from the State of New York. But there has been a good crop of clover honey in the clover belt as a whole. In some sections of it, however, the season has been poor, especially in parts of New York and Maine. The fruit crop, in spite of statements to the contrary, seems to be very meager in many of the States; and this will have a tendency to make the market for honey

more stable in spite of the large crop of honey that has been secured. Reports from everywhere show that clover honey this year is of exceptionally fine quality. It has been an old-fashioned clover year.

In Eastern Colorado the indications show that there will be a fair crop. As to the Western part of the State the following letter will explain:

The western part of Colorado has had but a very light flow from alfalfa, and unless we have rain there will be no flow from sweet clover.

GUY CLARK.

Crawford, Col., July 26.

DANGER OF ROBBING AT THIS TIME OF THE YEAR; THE VALUE OF THE ROBBER-TRAP.

Now is the time to avoid robbing. Nothing costs the bee-keeper more than to let a bad case of robbing get started; for so long as these robbers exist at all they will continue to annoy both the bee-keeper and the weak colonies. We do not nowadays intend to let robbing get started; but if it does, we use the robber-trap. This is nothing more nor less than a common hive with a Porter bee-escape so arranged at the entrances that the robbers can pass into the hive but not out again. Something more effective than the Porter for this purpose is a long flat wire-cloth cone, the apex of it reaching about to the center of the bottom-board. The robbers will enter this better; and as the point of the cone is so far from the entrance they do not find their way back. This trap is put on the stand of the robbed colony, when, presto! they are caught. When the robbers are once trapped they should be taken immediately to an isolated location or brimstoned. Having once acquired the stealing habit they will do tenfold more damage in a beeyard than they can ever do good, and it is "a mighty good riddance" when they are removed entirely.

SUSPENSION OF THE "AMERICAN BEE-KEEPER."

THE announcement appears in the August issue of the *American Bee-keeper* that that number will be its last. In extending words of good by, the editor, Mr. Harry E. Hill, offers his thanks to friends and collaborators in this very nice way:

GOOD BY.

To every thing earthly there must be an end. So far as the present editor and publishers are concerned, the end of the *American Bee-keeper* has been reached. This is the last edition of the *Bee-keeper*, and I wish to express my sincere appreciation of and gratitude for the courtesies of my numerous readers whose kindnesses enabled me, during the first eight years of my connection with the paper, to increase its subscription-list from six hundred to nearly three thousand copies a month. Memories of these friends will always be recalled with pleasure.

After nearly eleven years of pleasant associations with the bee-keeping brethren of the English-speaking world, as editor of the *Bee-keeper*, it is with a feeling of profound regret that I bid them good by, and to each and every one of my readers I wish a full measure of success and happiness.

For several years past, other business interests have claimed my full attention, and I have repeatedly tendered my resignation to the publishers. This has always been met by the question, in substance, "What will you take to stay with us?" I was compelled to name my price, and it was always promptly conceded. This old round world never held two more whole-souled, honorable, conscientious, and worthy business men than W. T. Falconer and D. E. Merrill, who have been my employers in this work, and I naturally wished to do all in my power to reciprocate their courtesies in business, and I held on.

Mr. Hill is a good bee-keeper and a ready writer. He has an easy-flowing, forceful style, and his stepping down from the apicultural field of bee buzzings will be regretted. We trust that

we may hear from him occasionally through other mediums now published. He has other business interests outside of bee-keeping, and long since desired to be relieved.

The untimely death of Mr. D. E. Merrill, of the Falconer Co., mention of which we made on page 757, June 15th issue of this journal, so increased the responsibilities of Mr. Falconer that he did not care to continue the publication of the paper. It is announced that all subscription moneys paid ahead will be refunded as soon as it is practicable to do so.

CYRENIUS' CLIPPED TURKEY FEATHER FOR BRUSHING BEES.

Mr. F. H. CYRENIUS, of Oswego, N. Y., of whom mention was made on page 928, last issue, while here at Medina, inquired if we had ever used a turkey feather for brushing bees off from combs.

"Yes," we said, "that is older than the hills."

"But," he said, "the feather I use is trimmed down to within $\frac{3}{8}$ inch of the midrib. This makes the bristles stiff, and, unlike a brush or broom, it does not roll the bees off from the combs, making them angry, but *lifts* them off their feet—the stiff spines of the feather passing right under them."

He has sent a sample trimmed as he recommends. If you can imagine a long stiff turkey feather with the soft portion on either side trimmed down to within $\frac{3}{8}$ inch of the quill or midrib, you will have his improved brush. He calls attention to the fact that this brush is so light that it can be carried over the ear like the old-fashioned quill pen of the schoolmasters of yore olden times.

We suggest that some of our extracted-honey men try the clipped-quill brush, and report how they like it.

A GOOD SCHEME FOR EMPTYING COMBS CONTAINING ODDS AND ENDS OF HONEY, WITHOUT THE USE OF THE EXTRACTOR.

ON reading this heading you may say there is nothing very wonderful about this—that all one needs to do is to scatter the combs, after the honey-flow, around in the yard where the bees can get at them, when they will very soon clean them up. Y-e-s; but it causes more or less of an uproar; and after the honey is gone, the bees are likely to pounce upon weak nuclei or to sting viciously. We would not advise practicing this near a public highway unless the combs would be emptied along about nightfall. They should then be taken away. During the night the bees will recover to a great extent from their excitement, and will be less likely to cause disturbance next morning.

The suggestion has been made to remove all such combs some rods away from the yard. This is far better than exposing them in the apiary itself. But even this has its disadvantages, for it will take some hours before the bees find the honey. Feeding syrup outdoors is good; but one should generally use a feed made of water and granulated sugar, two of water and one of sugar; and that syrup should be placed in feeders so constructed as to permit the bees taking it only very slowly. When so arranged the rob-

bing of other hives can be entirely overcome. Indeed, one can do extracting at such times without a robber appearing, even though it be during a dearth of honey; but for the purpose of extracting, one should use honey diluted with water.

The scheme we had in mind, however, for emptying out old combs containing odds and ends of honey, and perhaps a sugar syrup which can not be marketed, is on a plan somewhat modified from those described above. Our Mr. Mell Pritchard, who has charge of our north yard, had quite a lot of combs, some of them filled with the sugar-and-honey mixture—a combination which, obviously, can not be used for the market. He did not care to mess up the extractor, as he had only a few of them; and even if they were extracted they would be wet; and when the bees cleaned them up they would put some honey back into them again, and, besides, some of the combs would be undesirable, fit only for the melting-tank. He placed a number of these about nightfall in front of the hives, one frame in front of each entrance. A little later, after a few bees had clustered on the combs, he put them in hive-bodies and carried them about a quarter of a mile from the apiary, and set them down. The next morning those bees, filled with honey, of course, flew homeward and deposited their loads, and went back for more, and so until the combs were completely emptied.

But you may say that this operation involves as much work as the use of the extractor. Perhaps; but it has the merit of making a genuine honey-flow so one can carry on some special work in opening the hives which he may have in mind. So far from making a general uproar it makes absolute quiet in the yard, and takes care of all the robbers. In this way Mr. Pritchard emptied out quite a bunch of combs. Those that were good he could use over again in feeding to produce cells, and the others were consigned to the scrap-pile, and melted up.

But he had one other plan that worked very well. He put a comb of honey in a shallow box having a passageway connected with the entrance of the hive. The object of covering the comb was to keep away outside robbers, and at the same time permit the inmates of the hive to rob out the honey slowly. This comb feeder worked very well, especially in the case of combs that are imperfect, or which contain only a small amount of honey. In fixing bees up for winter it is not desirable to give combs containing only a little honey.

UNCAPPING-KNIVES; SHOULD THEY BE HOT OR COLD FOR UNCAPPING?

WE have been making some experiments in testing hot and cold knives heated in hot (not boiling) water, kept so in a pan over a small kerosene-stove. Where the honey is thick, and the comb new, the hot knife is unquestionably better than a cold one for taking off the cappings, for the reason that the latter is quite likely to break down the cell walls of tender comb. When it comes to old combs, a sharp keen-edged cold knife will do very good work; but a hot blade, not quite hot enough to melt the wax, will do faster and better work. But the trouble is, the

knife cools quickly, and then it must be exchanged immediately for another one just out of the hot water. This consumes time; and it is a question whether, with old combs at least, some of our producers would not think they could work faster with a cold knife provided the edge was very keen. We should like to get some expressions from our subscribers who have had considerable experience in uncapping.

THE TERRIBLE AFFLICTION THAT HAS COME TO E. W. ALEXANDER.

OUR friends have probably noticed that Mr. Alexander has not written very much of late. This has been owing to his poor health. But we did not suppose that there was any thing serious until the following letter came.

We wrote Mr. Alexander, asking certain questions, and toward the close of his letter, which was dictated, he writes:

Friend Ernest:—This is the first letter I have tried to dictate in a long time. I have been sick—oh, so sick!—that I have been able to walk only a few rods at a time around home. I returned from the hospital on Friday, where I was attended by six of the most eminent doctors and surgeons of this State. They all agreed that my trouble was incurable; that an operation might prove fatal—it certainly could do me no good. They advised me to go home, settle up my business, and live wholly for to-day. I have not opened a hive of bees since they were taken from the cellar last spring, and have been but very few times in the beeyard. E. W. ALEXANDER.

Delanson, N. Y., July 29, 1908.

We feel sure that all of our readers will be very sorry to hear this. Mr. Alexander has been a frequent and valued contributor, as many letters that have come to this office testify. Only three days ago Mr. Chalon Fowls, of Oberlin, Ohio, a prominent producer of extracted honey, remarked to H. H. Root, who was then visiting him, that the Alexander strainer for extracted honey was one of the best things he had ever tried. As soon as he saw a description of it in *GLEANINGS* he immediately had one made, and found that it answered the purpose perfectly.

There are several other useful devices as well as methods of management that Mr. Alexander has placed before our readers. While at times he may not have seemed orthodox, yet it must be remembered that he occupies a locality where conditions are peculiar not to say remarkable. Our friend is the only bee-keeper in the United States who has ever been able to manage from 700 to 800 colonies all in one apiary. Others have had as many as 500. While his location is peculiarly favorable for the keeping of a large number of bees in one place, yet the mere fact that his neighbors, with practically the same environment, do not keep more than 200, would seem to argue that there must be something in his management. He has freely given us of his ripe experience covering many years, and many who are using his ideas will hold him in grateful memory.

We desire at this time to pay tribute to a really great bee-keeper before his career shall be closed for ever. We say "great" because he is great in many ways. He is a broad-minded, large-hearted, lovable man, and many have been the pleasant hours we have spent with him and his family. To see and know the man has been indeed a privilege.

GLEANINGS FROM OUR FOREIGN EXCHANGES

By W. K. MORRISON

Some one in the *British Bee Journal* recommends the logan berry as a splendid plant for bees. California is the homeland of this berry, yet we have had no reports of any great results, though large areas are planted with it near Santa Cruz and Watsonville, California. Will somebody living there let us know its intrinsic value as a honey-plant?

The bee-keepers of the two Charentes held in July an international exhibition, lasting three days, of bees, bee-appliances, and honey, at Saintes, a town in France of about 20,000 inhabitants. This gives us a fair idea of the enterprising spirit which characterizes many of the European bee-keepers' societies. It takes a considerable amount of money and a great deal of work to conduct such a meeting; but it is worth it in the enthusiasm it creates.

THE LENGTH OF BEES' TONGUES.

Professor Kulyagin, of Russia, claims to have found a very accurate method of determining the length of a bee's tongue; and after many measurements he gives the following averages expressed in millimeters: Russian, 6.21; American, 6.22; Italian, 6.25; Cyprian, 6.50.

A DISTINGUISHED BEE-KEEPER.

Mr. E. Beuve, president of the Society of Apiculture for Aube, in France, has received from the president of the republic the Order of Merit (Agricultural) on account of his long and useful services to apiculture. He is teacher of apiculture in the normal school at Troyes. He commenced in 1858, and has kept for years 700 to 800 colonies, which is a very large number in a country like France.

TRANSVAAL BEE-KEEPERS' ASSOCIATION.

Johannesburg now has a full-fledged bee-keepers' association with the above name. Those at the top are the Earl and Countess of Selbourne; the Minister of Land, the Minister of Agriculture, and General Louis Botha. It is intended to have branch associations in the principal centers, and one is in course of organization at Pretoria. The conditions are suitable in South Africa, and in time the land of Angora goats and ostriches, diamonds, and gold will probably figure largely in the bee-keeping world. I note the colonists show a decided preference for American bee-supplies, in which they follow the example of other British colonies.

THE DEATH OF ZOUBAREFF.

The *British Bee Journal* recently announced the death of a famous Russian bee-keeper, M. A. F. Zoubareff, at the ripe old age of 87 years. He went to school with Pobedonostseff, Procurator of the Holy Synod of Russia, who died last year. Readers of the newspapers will remember it was Pobedonostseff who inspired the Czar to resist all

reforms. On account of his health Zoubareff went to Switzerland in 1883, and there became acquainted with Mr. Ed. Bertrand, who converted him to the Langstroth hive and system. Hitherto he had advocated the Dzierzon-Berlepsch system. He was largely instrumental in inducing the Russian bee-keepers to adopt the Langstroth hive. He wrote a book with this end in view, chiefly to instruct schoolteachers in our system. He also translated Mr. T. W. Cowan's *Bee-keepers' Guide Book* from French into Russian, and otherwise worked faithfully to help Russian bee-keepers find the most profitable system of bee-keeping. He lived close by Lake Ladoga, not far from St. Petersburg.

THE FRENCH SOCIETY OF APICULTURE.

There was a general assembly of the French bee-keepers' societies held at 61 Lafayette Street, Paris, March 31. The congress was presided over by Mr. Dumont, the vice-president. Dinner was served, the principal items of which were hydromel, honey ginger-bread, and pure honey. Probably the most important topic discussed was what the tariff on foreign honey should be. It is evident the French are afraid of foreign honey, and they intend appealing to the Chamber of Deputies for a higher tariff. They decided 30 per cent would be sufficiently protective on table honey; but for all others, particularly that used in bakeries, 50 per cent would not be too much. The matter of duties will come before the Chamber of Deputies during the political year of 1909, and it is expected they will be guided by what the bee-keepers have recommended.

PRICES OF HONEY AND WAX IN HAMBURG.

According to Mr. Richard Brückner, in *L'Apiculture Nouvelle*, the prices of honey and wax in Hamburg are as follows: California honey, 9 cents; Chile, $4\frac{1}{2}$ to 5; Cuba, 5 to $5\frac{1}{2}$; San Domingo, 5 to $5\frac{1}{2}$; Havana, 5; Mexico, 5. Beeswax from Benguella, 30 cents; Brazil, 30; Chile, 30; Cuba, 32; Madagascar, 29; Morocco, 30; Japan (vegetable wax), 10; Carnauba (palm wax), 31; and gray Carnauba, 22.

One might conclude from this that the Germans are getting some cheap honey; but the duty is high; and this, together with commissions and other charges, probably doubles the price before the consumer is reached. This is rather a pity, as the Germans are fond of honey, using it in many ways. There is no prospect that the duty will be lowered; on the contrary, the tendency is toward a high tariff, and the same is true of France. They do not believe in the doctrine, "Peace on earth and trade with all mankind."

BEES AND FRUIT.

The *Daily Mirror*, of London, has entered on a novel experiment to test the value of bees as pollenators of fruit flowers. It has installed on the roof of the *Mirror* office two hives of bees with the expressed intention of finding out the value of bees to flowers. It has also arranged to send experts around to observe the effects of the flowers. The secretary of the Royal Botanic Gardens said that the fruit-trees in gardens gave little or no fruit, though every possible attention was

given them and the blossoms were profuse. Failure to fruit he attributed to the lack of bees to pollinize the blossoms. He thought bees had a far greater effect on plant life than most people had any idea of. Frequently, he said, the want of fruit was attributed to the cold weather in spring when rather it was due to the dull and chilly days causing the bees to stay at home during the blooming period. This testimony is interesting, coming as it does from the largest city on earth, where smoke and grime gild every thing, even the flowers, fruit, and honey. No doubt the bees will "make good."

"WAX CRAFT," BY T. W. COWAN.

This is certainly the best book on beeswax which has yet appeared in English or any other language. It covers the whole subject in a manner which leaves little to be desired. The book itself is admirably printed and bound; in fact, it is a model of its kind—a credit to its publisher, L. Upcott Gill.

It commences with a historical sketch, giving a vivid account of the place of beeswax among the great oriental nations of antiquity, and following on to the present day. A beautiful illustration is given, as a frontispiece, of an encaustic wax-painting taken from *Herculaneum*. It is copied from a steel-engraving by F. A. David (Paris, 1780). Other illustrations of a like nature enliven the text and add materially to the value of the work.

Beeswax must have been an important article in the days of the Pharaohs, for on page 31 we read:

From a papyrus of Rameses III. we gather that payments were made from the royal treasury of sacrificial funds, such as the following:

331,702 jars of incense, honey, and oil;
3,100 *teben* of wax;
1,933,766 jars of incense, honey, fat, oil, etc.

In the times of Zoroaster, his worshippers burned candles in their worship of the sun-god. It was also done by the pagan Romans and also by the Greeks of Attica in honor of the god Ceres. Of course, the great Greek and Catholic churches use immense quantities of beeswax candles in their church services, and the worshippers of Buddha in Ceylon also consider wax candles indispensable. These candles have been used to light cities, for the Emperor Constantine ordered Constantinople to be lighted on Christmas eve by means of lamps and wax candles. In the city of Fez to this day the birthday of Mahomet is celebrated by every schoolboy carrying lighted torches of beeswax, some of them weighing as much as 30 lbs. In the early days of the Catholic Church, votive offerings were frequently made of beeswax; and it is related that the church of the Annunciation, in Florence, had its walls completely covered by them.

In ancient times beeswax was used as a medicine. Pliny says: "Every kind of wax is emollient and warming, and tends to the formation of new flesh; fresh wax is best. It is given in broth to persons troubled with dysentery, and the combs themselves are sometimes used in a pottage made of parched alica. Wax also counteracts the bad effects of milk; and ten pills, the size of a grain of millet, will prevent milk from coagulating in the stomach."

Both Herodotus and Strabo state that beeswax was used for embalming the dead.

It must be evident to the reader that the production of beeswax "in ye olden tyme" must have been very great, and it was. For example, in the year 181 B. C., Prætor Pinarius, after defeating the inhabitants of the island of Corsica, imposed on them an annual tax of 100,000 lbs. of wax, and two years thereafter doubled it. Again, we read that in 1632 John de Frettar, sexton of the monastery of Chaise Dieu, in France, stipulated for an annual rent of 600 lbs. of beeswax.

In London "The Worshipful Company of Wax Chandlers" was organized as early as 1371, and still exists, chiefly for ornamental purposes. It obtained a royal charter in 1483.

How the bee produces wax is fully described, but we need not here advert to it. One paragraph, however, is worth quoting.

Huber, after a series of experiments, several times repeated, proved that bees fed on honey and water produced wax; while, if fed only pollen, none was produced. He also showed that bees fed on sugar syrup were able to produce wax, and (after several consecutive trials) that those fed with syrup made of sugar made more wax than when fed on honey, brown moist sugar yielding the largest quantities. These results were corroborated by Dumas and Milne-Edwards, who in 1844 repeated Huber's experiments and found that 500 grams of sugar yielded 30 grams of wax, while the same quantity of honey produced only 20 grams. Other observers, such as Gundelach and Berlepsch, have obtained similar results, so that Huber's conclusions may be considered as established.

Pages 53 to 72 inclusive are devoted to the subject of wax-rendering. Beeswax in commerce has a short chapter. Mr. Cowan states that the beeswax of Guadeloupe and Brazil will not bleach, but remain a mahogany color. This is not to be wondered at, for the bees of Guadeloupe and Brazil are stingless, producing quite a different kind of wax from ours. They produce beeswax almost the same as the kind we have; but they mix it with propolis to a considerable extent. It is interesting to know that the waxes of England, Hamburg, Odessa, Portugal, Mogador, Zanzibar, East and West Indies, and North America all bleach very rapidly, while those of Cuba, Danzig, Königsberg, Gaboon, and Gambia bleach with difficulty. Twenty-one pages are devoted to the subject of wax adulteration; and anybody who understands the subject will agree with me that the importance of the subject justifies it.

In chapter VII. Mr. Cowan carefully considers the manufacture of comb foundation. Coloring wax occupies chapter VIII.; wax candles and tapers have chapter IX.; manufacture of wax flowers has chapter X.; while chapter XI. contains 110 recipes in which beeswax is a prominent ingredient. Possibly this last is the most valuable part of the book, as one good recipe may be worth more than the price of the book.

We have long wanted a book of this kind. Beeswax is a very important object in commerce; it is almost equal to gold in all markets. Merchants anywhere are ready and willing at all times to take it in payment for goods, and the price fluctuates very little. It therefore deserves a very nice book.

Anything Mr. Cowan writes is worth reading; and this last proves that his pen has lost none of its cunning. It is a work which ought to be in every bee-keeper's library. For prices see Special Notices.

FANCIES AND FALLACIES

By J. E. CRANE

The testimony of E. W. Alexander as to the value of bees to farmers, page 642, should not be forgotten when neighbors complain of our bees.

FORMING NUCLEI.

The plan of forming nuclei from queenless colonies to make them stay in place, as given by Dr. Miller, page 622, May 15, is well worth remembering. It is a good practice, when we find any new method of management or manipulation, to put it to the test in a small way, and then we do not forget it.

PREVENTING LEAKAGE IN HONEY-JARS.

Mr. C. F. Smith is on the right track in using soft paper to prevent leakage in covers to tumblers filled with honey, page 624. I have often thought that if we had something like blotting-paper for the inside of caps like the Simplex and other jars, it would be far better than the hard board now sent with them. The soft paper gives, and a close joint is made.

KILLING MOTHS.

On page 571, May 1, Prof. H. A. Surface adds much to our knowledge for controlling the ravages of the bee-moth, and I have put his plan to the test and find it easily used. I have turned down a corner of that page so as to find it easily. The recipe is easily remembered, but it may be well to have his article handy to refer to, to be reminded of his cautions about using the dangerous drugs.

BOTTOM STARTERS.

The question raised by H. M. Jameson, page 643, as to why bees commence on bottom starters first, is interesting. He ascribes it to lack of heat; but as heat rises one would suppose it would be hotter at the top than at the bottom of the section. I think differently. It has seemed to me that the cause lies in the fact that some bees dislike to go far from their combs to start new combs. Many years ago I used boxes holding about four pounds of honey, with two starters of comb at the top, say 1½ inches square, with none at the bottom, and I found that certain colonies were much inclined to begin at the bottom. This was especially true of weak colonies and some strains of Italian bees.

BROOD AND HONEY IN THE SAME CELL.

I saw something new a few days ago. In transferring some young larvæ from a brood-comb to queen-cells for queen-rearing I found a cell among the brood nearly filled with honey, and a larva floating on the honey. The larva appeared to be about two days old, and I guessed that it had died from an unwholesome diet. Evidently some worker or workers had needlessly stored honey in a cell already occupied with brood. I do not remember ever seeing or hear-

ing of such a thing before. I have seen plenty of larvæ floating on honey, but it was where the clumsy hand of man had interfered by extracting both honey and brood together. Well, I think we ought to be charitable toward this one little witless bee for making such a mistake. The wonder is not that one has made a mistake, but that of the many millions of worker bees hatched, all know without teaching or experience how to feed the young larvæ by preparing just the right kind of food, and the exact quantity, as well as placing it in the right cells.

QUEEN-TRAPS VS. CLIPPED QUEENS.

It seems evident by the article on page 555, May 1, that R. L. Taylor does not intend to be led or misled by A. J. Halter, and on the next page Dr. Miller proceeds to prod him because he has dared to say that "clipped queens are an unmitigated nuisance at swarming time," and some other things. Well, I don't know much about the use of queen-traps; but it has seemed to me that the use of them on several hundred hives would be more "plague than profit" as an acquaintance used to say, and I could not well get along without clipping all my laying queens in spring, with apiaries many miles apart, and tall trees near. For all that, there is room for a difference of opinion between sensible people as to the value of clipping queens' wings. Talking with some extensive bee-keepers in Michigan last summer I expressed my surprise that they did not clip their queens' wings; but they showed me in about two minutes that they could care for their bees during swarming time with less labor if the queens could fly than if their wings were clipped, to say nothing of the labor of looking up all queens in spring.

It makes a good deal of difference whether you have several apiaries run for comb honey with many tall trees near by, or whether you have only one yard with a few small trees and shrubs, and are working for extracted honey. Those Michiganders are a splendid lot of men, but they have a way of doing their own thinking, and do not hesitate to take short cuts, even if not orthodox.

WIND AND WINTERING.

Which way shall we face our hives during spring weather? page 419, April 1—a live question, surely, and one that gives me a chance to say that wind plays a more important part in wintering and springing than most bee-keepers are accustomed to think. At the beginning of winter I had in my home yard 127 colonies to be wintered outdoors. I have just been looking them over, and find a loss of 15 colonies, nearly all during the spring. We have had one of the worst springs for bees I ever knew—almost constant heavy winds, either north or south, from March 15 to May 15, with the exception of the last week in April. Of the above number of colonies 24 faced north, 35 east, 30 south, 38 west. Of the dead colonies, 2 faced the north, 6 the east, 2 the south, and 5 the west. One of those that died facing north was robbed late in spring, and died from starvation. In proportion to the number of hives, the loss in those facing east was twice as great as in those facing

either north or south. I see no great significance in this, and believe chance had much to do with it.

But another matter has interested me greatly. My yard is about 40 feet wide, east and west, and 160 feet long north and south, and better protected from winds at the north than at the south end. I find that the loss in the north half of the yard was barely one colony, while in the south half the loss was 14. I also find that the colonies of the north half average much stronger, as a rule, than those at the other end. I have observed the same conditions in other years, although not, perhaps, so pronounced. Such facts hardly need comment. In selecting a site for bees, take one where the snow lies on the ground all winter without drifting, and then set facing any way you like.

BEE-KEEPING IN THE SOUTHWEST

By LOUIS SCHOLL

The Texas Bee-keepers' Association convened in annual convention at College Station, Texas, July 7, 8, 9, with a good attendance. Officers for the ensuing year are: F. L. Aten, Round Rock, President; J. N. Long, Pearsall, Vice-president; Louis H. Scholl, New Braunfels, Secretary-treasurer. This has been one of the most profitable meetings the association has ever had.

LIVE-BEE DEMONSTRATIONS.

If you intend to do any advertising, be there with the goods, so the people can see them; and then if you have the right kind of "gab" to go with it you'll do your advertising. Therefore live-bee demonstrations are great advertisers if the right person is in charge. Such a one was given last year at the Texas Farmers' Congress, and was so interesting we were requested to give it again this year.

THE SEASON IN TEXAS.

While some localities in Texas have had a failure in a honey crop, others have proven extraordinarily good. In our own localities here, numerous spring flowers, from early until late in the season, put the bees in the best possible condition; and although we did not have our usual April flow from the mesquite, horsemint and marigold made up for it and even continued longer, so that, when the second yield from mesquite began in early June, the bees were kept continually at work. Then before the mesquite flow was over, cotton honey was coming in with a rush, lasting throughout June and July; and the bees are still working steadily on this plant, of which there are thousands of acres within easy reach of all of my yards. So, all together, this has been an ideal year with those who are located as favorably as I am.

But the total yield for the entire State will be short, and prices will reign rather higher than before. Mr. Toeppiwein writes:

THE PURE-FOOD LAWS AND HONEY PRICES FOR TEXAS BEE-KEEPERS.

The pure-food law, from a bee-keeper's standpoint, is one of the best and most important laws that have ever been passed. I never heard of a bee-keeper wanting to sell impure honey, and the consumer realizes this. Therefore, if the bee-keeper and consumer could deal directly with each other the bee-keeper would have no difficulty whatever in disposing of all the honey that he can produce at a good price. Much more honey would be consumed if the people could be sure that every pound they buy is pure. In Texas there was rarely any impure honey put up. The adulterated honey that was sold here was put up in other States and shipped in. Since the pure-food law is in effect this can not be done, and the consumers are aware of it; and for this reason we have a better demand for extracted honey than we formerly had. A great many people have bought comb honey because they want to be sure that the honey is pure; but the pure-food law has caused the demand for extracted honey to increase so that the difference between comb and extracted honey will be less. Many would just as soon have extracted honey as comb at the same price, or even prefer it, so long as they know it is pure. Others, who would not eat honey formerly, eat it now, and are willing to pay a fair price for it.

The only way I can sell honey is to show my buyers why it is profitable for them to handle it; and the way I do it is this: I guarantee that all the extracted honey has been heated to not less than 152 degrees, and that it will not granulate within 20 days from date of shipment. Then I put the price where they can move it, and when they are backed up with this guarantee they are willing to handle it.

Some bee-keepers will not heat their extracted honey, as it is too much trouble, and they say that they can find buyers who are willing to buy it just as it is taken from the hives. This was true the past spring before the buyers knew how fast certain kinds of honey would granulate. Then when this honey did granulate, these bee-keepers did not always take it back, but left it in the hands of the wholesale dealers, saying that it was in good shape when they sent it. Now, this may be true, and they be legally correct; but the buyers do not want to handle honey any more. Such business injures every bee-keeper in the State, and we should encourage our neighbors to heat every pound of extracted honey they sell, so it will not be likely to granulate within thirty days. If we give this guarantee, then we can readily dispose of our honey, and the price will go back to where it should be, and where it was this spring. If not, the demand for bulk comb honey will decrease.

We should encourage the use of bulk comb honey, as bee-keepers in other States do not put up much of that kind of honey, and naturally we have but little competition, while extracted honey can be obtained almost anywhere. We get more for our honey than bee-keepers in other parts of the country, as we have the demand for it right here in our own State and neighborhood. Our crop usually comes before honey is shipped in from other States, and this always helps us a great deal in holding a steady price on our prod-

uct. Bee-keepers should correspond, or have meetings and decide on a price, then make this known to the wholesale dealers, giving assurance at the same time that no producer will sell direct to the retailers, for such a practice ruins the wholesale trade every time. Under these circumstances, when the bee-keeper sells to the wholesale dealer he is sure of getting his money; whereas, if he sells to a retailer he loses an account occasionally, which loss about makes up the difference between the retail and wholesale prices. As a rule, the retailer is not going to pay a little honey account, as the surplus money he has usually goes to some wholesale house to which he is indebted. These wholesale houses have men who call upon him every week and collect from him. A bee-keeper, however, can hardly afford to go to the retailer's town to sue him; and this retailer, therefore, either defers the payment a long time and then says the honey was not as represented, and compromises for probably half; or he sometimes refuses to accept it, and the bee-keeper has to take the honey back, paying freight both ways.

Now, this happens right along, and the bee-keeper who tries it once usually does not try it a second time. This is bad business for the wholesale dealers, for they are willing to pay probably the same price for the honey, and are in position to sell it to these same retailers at a better price, thus giving them a profit for handling it, and in that way the price is held up. If the bee-keepers would follow the example of the onion-growers, selling all their honey to one or a few buyers at a set price, they would not glut the market; and with a steady price, and the goods put up properly, there would be no trouble whatever in disposing of all the Texas crop at a good profit.

UDO TOEPFERWEIN.

San Antonio, Texas.

CONVERSATIONS WITH DOOLITTLE

CLOSING UP THE SECTION-HONEY SEASON.

"As the close of the honey season for 1908 is drawing near, I wish to know how I can secure all the section honey possible, as I wish to make as good a show as I can this year."

"The approach of the close of the comb-honey season is always a time of importance to the apiarist. As he wishes to secure as much as possible, he puts on so many sections that very few of them are ever completed. All know that this is undesirable, but many have not learned enough by the loss to be able to stop it. How it may be prevented, or reduced as largely as possible, is a question worth considering."

"I know that is right; but how is it to be done?"

"By lessening the amount of surplus room, or by giving the extra room in such a way that the bees will not go into the sections unless they are crowded."

"But if I lessen the amount of room before the end of the honey-flow, would this not mean a serious curtailment of the season's crop?"

"Yes. But to go ahead and put empty supers under the full ones, the same as you did in the

height of the flow, is almost sure to result in a loss just as great. That is why the room should be given in such a way that the bees would not occupy it unless needed."

"How is that done?"

"By putting all supers used at this time of the year on top of those the bees are at work in, rather than under."

"I gave that a trial once, and I did not like it. I thought it reduced my crop of completed sections, and gave me a whole lot of unfinished sections at the close. The bees were slow in going into this upper super of empty sections, for they stayed on the sealed honey for some days, and then when they went into the upper super the season closed when but few of the sections were more than two-thirds full, so I had a whole super of unfinished sections to each hive."

"You should have removed the completed super when finished, or else put the empty one under it as soon as the first one was completed. It is more likely, however, that you did not put the empty super on top soon enough. I have never had an experience like that in putting the empty supers on top."

"You do not put on a second super till the one already on the hive is completed, do you?"

"Surely. If you wait till the first super is finished, a loss is always sure to occur. As soon as any cells are sealed, more room should be added. In the beginning, or during the height of the season, it does very well to put the empty super under the first, although of late years I put all supers, after the first, at the top. But when nearing the close of the season they should *always* be put on top as soon as the bees begin sealing the cells in some of the sections below."

"That is something new to me. I supposed that no more room was needed until the sections already occupied were nearly or quite completed."

"It is well to gauge as carefully as possible the storing strength of the colonies and the probable duration of the flow, neither contracting unduly nor giving room recklessly."

"Is it ever best to remove the completed sections from any super until all the sections in the super are finished?"

"This would depend quite a little upon how much time you have at your command. If you have plenty of time there is no doubt that it would pay. Before I went into the queen-rearing business I used to go over the apiary once a week and remove all of the finished sections from any super which had one-third or more of the sections completed."

"Did you put the empty sections in the place of those taken out?"

"No. The partly finished sections which are left should be ~~massed~~ together in the center of the super, and new ones put on either side, so that we may get as many completed as possible should the season stop short at any time. This precaution will very largely reduce the number of sections which are nearly or quite filled, but not completed, and these make the matter of unfinished sections so aggravating."

"I think I understand this matter better than I did, so let us suppose the end of the season has arrived and I have a lot of unfinished sections—how shall I manage them?"

"The first thing to do is to get the sections off

the hives and sort them over to see how many are completed, nearly completed, etc. The number of grades we are to make depends upon the use we make of the unfinished ones. After sorting out all that are completed I usually put the rest into three classes. The first class are those which have very little if any honey in the cells. If any have from ten to fifty cells of unsealed honey, they are allowed to go in this class, but no sealed honey is allowed with this lot. In the second are those that are less than two-thirds finished. In the third class go all that are above this."

"And now what do you do with each class?"

"The sections in the first class are carefully stored away in supers, ready to be put on the hives at the very opening of the next honey-flow, if they are not needed for baits."

"Do you mean that you put on a whole super of these at the beginning of the flow?"

"Yes, if I have them so I can; for with such sections the swarming fever is almost always done away with, because the bees enter them before any honey is crowded into the brood-chamber; and by giving more supers, as we have just been talking about, such colonies will, more often than otherwise, pass through the season without swarming at all, giving a large yield of honey every time. The second class is set away to have the honey extracted from them at the first opportunity, after which the bees are allowed to clean them up, when they are used for baits in preparing the supers for the next season; or they are reserved for feeding any colonies which may need it the next spring. After the bees have taken the honey from them, they are used as bait sections. I prefer to use enough to make two rows through the super, if I can have that many. By putting these rows of baits so there is only one row of sections on either outside of them it is no trick to get a super completed all at once, as the bees always do more work in the center of the super, where left to themselves, than they do at the outsides. But by thus placing the baits they begin at or near each side first, and thus the sides are completed as quickly as the center, and all come off completed equally. If I am short of baits the sections in the third class are treated the same as those in the second; otherwise I sell them either at home or ship them to New York. A few years ago I did not think this latter could be done; but I tried a few cases one year, when I had more than was needed, and the returns gave me within 2½ cents as much as for my fancy honey. Since then I have remembered it, and I find that my first experience with shipping is the rule, and that it is more profitable to ship all two-thirds-sealed sections, having the remaining third filled with unsealed honey, than to dispose of them in any other way unless I am short of baits. If short, I sometimes think it would pay to extract or feed fully completed sections for the baits they would make."

Borodino, N. Y.

A California paper states the Imperial Valley Bee-keepers' Association have practical control of the honey output of the valley, and are securing good prices on the cars shipped East. There are now 7000 stands of bees in the county.

GENERAL CORRESPONDENCE

SWARMING.

Some Facts to Prove that the Scouts Usually Search for a Home Before the Issuing of the Swarm.

BY J. E. HAND.

Mr. Greiner's article, p. 1507, last year, revives an interesting subject that was discussed pro and con in the bee-journals a number of years ago, and calls vividly to my mind some experiments that I conducted some 20 years ago in Iowa, with a view to finding out the truth about the scout theory.

A prairie country where the timber grows in belts along the streams, and where trees suitable to lodge a swarm are scarce, offers superior advantages for studying the habits and instincts of bees relative to their choosing a home before and after the issuing of a swarm.

I lived on the banks of the Iowa River, in Hardin Co., Iowa, and in conducting these experiments I loaded a flat boat with empty hives at swarming time and scattered them along the banks of the river, usually in some tree, and some eight or ten feet from the ground. I visited these hives every day, and have had swarms enter such hives the same day they were put up; and, again, I have known the scouts to take up their abode in a hive every day for nearly a week before the swarm took possession.

Again, I have known of more than one instance of a swarm issuing from the parent hive and making off to one of those decoy hives without clustering. Like Mr. Greiner I have had strange bees come into my apiary, and take possession of an empty hive in which the scouts have been working for several days. All my experience along this line goes to prove that bees usually search for a home for several days before the issuing of a swarm. However, they are not always successful in locating a suitable abode, in which case the swarm will fly in a straight line for some distance and then cluster again and repeat the operation of searching for a home, and doubtless this was the case with the swarms that entered Mr. Greiner's hives. Undoubtedly those swarms came from a distance, and clustered not far from Mr. Greiner's apiary.

I believe bees search for a home in very much the same way that they search for stores of pollen and nectar, and that more than one swarm often choose the same hive is evident from the fighting of the guards at the entrance of these hives. After a swarm once chooses a decoy hive for their future home it is as faithfully guarded until the swarm takes possession as it is afterward, and no intruder is allowed to enter.

Bees seem to prefer to seek a home at some distance from their present abode, and I have known swarms to leave the hive the next day after being hived, and go straight to a decoy hive 1½ miles away. The scout theory is an established fact, and offers an interesting theme for the student of bee nature.

Birmingham, Ohio.

A HIVE-LIFTING WHEELBARROW.

How it May be Used to Save Hard Work.

BY ANDREW C. BROVALD.

The illustrations show my hive-lifter and carrier on which I have applied for a patent. I have solved the problem of lifting and moving heavy supers and hives, to my own satisfaction at least. I can examine the brood-nest with two supers on about as fast as if it had only the cover over it.

The frame is 6 feet long, and the clamp that grips the hive is 25 in. long, and opens 20 in., so

no lifting to do you can take it out entirely), laying a couple of boards over the frame, one can pile on about three times as many empty supers as on a common wheelbarrow.

To illustrate further the convenience we will take the hive manipulations that Doolittle describes in "A Year's Work in an Out-apiary," where he puts the upper story down on the bottom-board and takes the old brood-nest away: that is an easy operation with this machine. I simply slip the lifter over the two-story hive as it stands, lift the whole to one side, then set the upper story back on the bottom-board. Thus it is done at one operation.

There are many bee-keepers with hundreds of colonies who put the second super on top when the first is partly filled with honey just because it is too much of a job to lift off all these heavy supers and put the empty ones next to the brood-nest. Now, I think the majority of bee-

keepers agree that a nearly filled super next to the brood-nest is conducive to swarming, and that it is detrimental to the best results in honey-gathering. Now, by using this lifter I can take the super off in just about the time it takes to lift off the cover; so if I can gain only one pound of honey per colony by using the lifter it pays for itself for every 100 colonies in that one operation. My opinion is, however, that I gain several pounds per colony, besides keeping down the swarming impulse.

The super, while off the hive, hangs in the clamps of the lifter. I don't have to set it down on anything, so there is no smashing of bees.

In taking off honey the lifter saves a lot of hard work. I leave the honey on the hives till the flow is about over, and use bee-escapes. My bee-escape boards are used for super-covers, so when I put them under the supers they are left there, and I do not have to disturb the bees any more, and it is quite easy to put in the escape-boards with this lifter. When taking off supers there is more or less burr-comb on the under side of the bottom-bars. That used to bother me somewhat; for when I set the super down on a flat surface the burr-combs would spring the bottom-bar so as to smash the lower edge of the combs. With this lifter there is no bother whatever on that account. The supers hang in the clamps, and I wheel them to the extractor.

Babcock, Wis.

Imperial Valley, Cal., will ship 20 carloads of honey this year. Last year it had but 7.

BROVALD'S HIVE-LIFTING WHEELBARROW.

it will grip any box from 12 to 19 inches in width. The two standards that are bolted to the cross-pieces in the frame are 2 feet long, and have grooves in them in which the lifting attachment is held. These standards are for the purpose of adjusting the lifting attachment to the height of the hive. For instance, to take a ten-frame double-walled hive standing on the ground, the lifting attachment has to be let down to the last notch; and for taking off supers it has to be lifted up. There is a place in front of the lifting attachment about 17×20 inches, where a comb-bucket and tools can be carried, or supers that are ready for putting on the hives.

Besides having the lifting attachment it is more convenient in the apiary than a common wheelbarrow, because, by dropping the lifting attachment down out of the way, and (if you have

BEE-KEEPING IN AUSTRALIA.

An Interview with the President of the Victoria Apicultural Association.

[Our readers will remember that Mr. F. R. Buehne, of Tooborac, Victoria, Australia, came to the United States in May to introduce his new cap-melting device—a machine that he claims not only melts the cappings as fast as they leave the uncapping-knife, but delivers the melted wax and honey in two separate receptacles before they actually cool. On this trip he called on the publishers of this journal, and during the course of our conversation with him we found him to be an exceptionally well-posted bee-keeper. When it comes to practical stunts in the handling of bees he probably has few if any superiors. As an indication of how well he is regarded in Australia we will say that he is President of the Victoria Apicultural Association, and Bee Expert of the Department of Agriculture for his State. While here showing his machine and explaining its merits it occurred to us that it would be very interesting as well as profitable to put him on the witness-stand and make him answer questions. We accordingly arranged for an interview, with a stenographer present. In that which follows we believe that our readers will acknowledge with us that he is a Gamaliel at whose feet we may profitably sit and listen, for he has had a varied and ripe experience that will be worth something, even to us Yankees who are supposed to beat the world in the production of honey. We are glad, therefore, to introduce Mr. Buehne, and will now ply him with questions to answer.—ED.]

BEE PARALYSIS.

"How do the climatic conditions of Tooborac, Victoria, differ from those in Germany, Mr. Buehne?"

"Those in Germany are much the same as in the Eastern States of this country. My present locality is similar to that of Southern California. It is similar to California in climate if not in flora."

"What race or strain of bees do you find gives the best results?"

"The darker strains of Italians."

"Why do you prefer them?"

"Because of their greater immunity from bee paralysis."

"Do you find the yellow Italians as free from that disease as the darker strains?"

"No, decidedly not."

"Do you find that your strains of Italians resist foul brood better than black bees?"

"I do. On one occasion five cases of foul brood occurred in an apiary of 250 colonies, and four out of those five were in colonies of black bees, of which there were only five in the whole apiary."

"Do you find that bee paralysis is more prevalent in some parts of Australia than others?"

"Yes, that is generally acknowledged by our bee-keepers."

"What constitutes the difference in these localities?"

"The dry inland districts are favorable to the development of paralysis, while in the cooler coast regions it is almost unknown."

"Did you ever attempt to introduce any other strain in your locality to improve your bees?"

"Yes. On many occasions I found that, with new blood, came a predisposition to bee paralysis. On one occasion I bred over ninety queens from two specially yellow breeders, and introduced them with the view of improving my own strain. The result was that both breeders, with all their bees, succumbed to paralysis the following spring, and every one of the colonies of their queen progeny was more or less affected—so much so that I requeened the whole of them as fast as

I could from queens of my own original strain, keeping them going with brood of the same in the meantime. I thus lost the entire season in keeping up my colonies."

"How much did that loss amount to?"

"At least \$500."

"In a general way, do you find the extra-yellow strains as hardy as your ordinary regular leather-colored stock?"

"No. They are much more influenced by changes of temperature, being easily chilled in cold weather."

"Are the yellow strains used very much in localities on the coast?"

"No. The yellow bees are kept principally by beginners."

"What cure, if any, have you for bee paralysis?"

"The only cure I know of is to requeen with a different strain. A temporary cure may be effected by feeding honey without any drugs."

"Why do you say without any drugs?"

"I have on several occasions eliminated the disease for the time being by feeding thin honey continuously for several months."

"Why do you feed *honey* rather than sugar syrup?"

"Because I am of the opinion that the digestive organs, being affected by paralysis, sugar which would have to be inverted would tax the digestion more than honey that is already inverted, or partially digested."

"Do you find that some individual colonies are immune to the disease, even when surrounded by other infected colonies?"

"Yes, I do; and it is such that I choose to breed from, with the view of creating a strain of bees immune to paralysis."

"Can you put combs from colonies affected with bee paralysis into healthy ones without carrying the disease?"

"Yes; in fact, it is a practice with me to put combs purposely from the infected colonies into such colonies as I esteem are immune, for the purpose of testing their assumed immunity."

"Will combs from such affected colonies carry the disease to colonies that are not hardy or immune?"

"I do not think so."

"What does carry disease from colony to colony?"

"Assuming paralysis to be a germ disease, once a locality has been infected, germs would be present everywhere, but would cause an outbreak only among bees possessing a predisposed constitutional weakness."

"If you were starting anew, would you begin with stock from a locality where bee paralysis was unknown?"

"No. I should prefer stock from an apiary from which it has been bred out by selection, as I have explained."

"Can you recall instances bearing on this point?"

"Yes. Fifty colonies which were sent to me from an apiary quite free from paralysis developed this disease in a most virulent form within a few days after being placed in my apiary, my own colonies showing no sign of paralysis, even when the new arrivals had become almost extinct."

To be continued.

E. D. TOWNSEND'S PINE LAKE YARD IN MECOSTA COUNTY, MICHIGAN.

THE LOCATION OF EXTRACTING YARDS.

The Advantage of a Protected Apiary; How to get the Honey to the Extracting-house with the Least Effort.

BY E. D. TOWNSEND.

If the bees find as much genuine pleasure in working in a yard where there is good outside protection from prevailing winds as the operator does, then there can be no doubt that this outside protection is a good thing. My boys are always glad when we have finished extracting at one of our yards where there is but little protection; and they look forward gladly to the work at our Pine Lake yard where there is protection from the wind. In our bee-keeping experience I suppose we have had yards in at least 25 different places, and in all kinds of locations—some well protected, and others not protected at all from the prevailing winds; therefore we think we have learned the value of protection, from actual experience.

No two of our yards are arranged on the same plan, for the hives are so located as to take advantage of the particular lay of the ground. As far as possible we locate our extracting-houses in the lowest part of the yard to facilitate the wheeling-in of the honey. Wheelbarrow paths are

chosen, leading from different parts to the house. At our Pine Lake yard, however, as shown in the engraving, we were obliged to place two of the rows of hives on the ground that was lower than the door of the honey-house. The main path for these two rows is at the upper side of both rows, where the ground is on a level with the honey-house door. In this way, by loading the wheelbarrow at the back of the upper row it is not necessary to run up hill after reaching the path. When the load is taken from the lower row the wheelbarrow is placed so as to be pushed directly up the short hill into the path. We have found that it is easier to push a load up a short steep hill than to push it all the way to the honey-house up a hill that is very much longer, although not nearly so steep.

On level ground it is not difficult to arrange the yard so that it will be convenient to wheel in the honey from all parts; but where the ground is uneven, a little planning must be done in order to make the work easier. If the ground is very uneven it is not best to try to keep the hives in rows, but to group them to some extent; for the first thing to do is to secure good wheelbarrow paths, of which there should be three or four leading to the honey-house. These paths need not necessarily be straight, for it is many times much easier to travel a little further in order to avoid a grade.

Having these main paths selected, the yard will

TOWNSEND'S YARD IN KALKASKA COUNTY, MICHIGAN.

thus be divided into three or four groups of hives. I prefer to have the hives placed facing the south or southeast. But in the majority of our yards we can pay but little attention to the direction, and the hives, therefore, face every way except the north. We see no difference in results, and it is possible that the colonies would do as well if the entrances were toward the north; but we always avoid that direction, perhaps from the force of habit.

Parallel with the lay of the ground we level pieces of ground 20 inches wide and 4 feet long, which is large enough for two hives placed side by side. Two 2×4's 4 feet long are laid down flat, and leveled. In this way the foundation is made for two hives. The front of the hives should preferably be $\frac{1}{4}$ inch lower than the back so that water will run out of the entrance. We formerly laid great stress on having our hives in rows all facing the south; but we find that this plan, in the majority of instances, was not satisfactory, on account of the lay of the ground. Furthermore a greater percentage of young queens were lost on returning from their mating-flight, and the bees themselves mixed up much more. Now the groups may be placed five or six feet apart one way and ten or twelve the other. On this plan the groups are really in rows which are not straight, perhaps, but irregular, to conform to the ground. Possibly some might think that this arrangement would not be pleasing to the eye; but there is really hardly any other plan that would look well on rough ground. The wheelbarrow may be run between each group of hives and also between each row; and it is an easy mat-

ter to load the honey very close to one of the main paths leading to the extracting-house.

In renting ground for bee-yards it is not always possible to secure a desirable place to set the hives. Our Kalkaska yard, as shown in the second engraving, is located on a side hill. However, we first made four terraces on which the rows of hives might be placed. Since the hill slopes to the southeast, the hives face in all directions between south and east. The honey-houses were set about midway at the lower side. A path was made across the terraces in the middle, dividing the yard in two parts. When extracting we work from the sides of the yard toward the center in order to shorten the distance to the honey-house. If we set this house at one side of the yard it would be necessary to wheel the honey, or at least the greater part of it, twice as far.

Remus, Mich.

MOTH AND LARVÆ DESTRUCTIVE TO BASSWOODS AND OTHER SHADE-TREES.

BY PROF. H. A. SURFACE.

[Chancing to go down through some streets in the residence districts of East Cleveland a few weeks ago we observed that many of the trunks of the trees had sticky fly-paper tied around them. On looking above at the foliage we noticed that the leaves, especially of the basswoods, were being eaten, and in some cases the trees were entirely defoliated. Having heard of the fearful ravages of the gipsy moth in Massachusetts, and hearing something to the effect that they might visit Cleveland at almost any time, we wondered as we walked down the streets whether the pests had not already reached our city. We observed that many of the trunks of the trees had cocoon masses much like those illustrated

of the gipsy moth. On examining carefully the trunks of the trees we noticed a great many worms, very strikingly beautiful yet ugly enough to make one feel "creepy." At the extreme end, or tail, was a tuft of straight brown bristles standing up at an angle of 45 degrees. Just back of the head were four little tufts or plumes of a very pale yellow. The upper half of the larva was somewhat larger in diameter than the lower. In a word, it was very showy, and appeared to be a voracious eater of the leaves. The lindens appeared to be the greatest sufferers, and then came the poplars and maples.

We asked some of the residents what the pest was; but nobody seemed to know very much about it except one man, who ventured that it was the California scab. Of course, we knew that could not be correct.

Fearing that the pest might be the gipsy moth—or at any rate knowing that it was something very destructive, and that possibly others might be suffering from it, we addressed a letter to Professor H. A. Surface, describing minutely the larva, and supplying a rough sketch. The letter below is interesting, and it may help others, who may have large numbers of basswood or maple trees, to cope with the ravages of the pest, for it is getting to be a very serious one in Cleveland.

On arriving home we observed that the same insect had begun work on a vine at a neighbor's house. He destroyed the whole vine, root and branch, in a bonfire. We then found that the cocoons were being built on the under edge of the clapboards of the house. These were carefully hunted out and destroyed. As Rootville is blessed with beautiful lindens, or basswoods, we did not care, of course, to have the pests started on them.

Prof. Surface's letter only emphasizes the importance of preserving our feathered friends. Small boys every now and then consider it fine sport, with an air-life or flobert, to pick off these birds one by one. These boys should be immediately informed that it is against the law.—Ed.]

Mr. E. R. Root:—I was pleased to receive your recent letter so accurately describing the larvæ destructive to the shade-trees on the streets of the

city of Cleveland. There is no doubt whatever concerning the correct name of the pest, as your description and illustration of the pest are accurate. This is the white-marked tussock moth, scientific name *Hemerocampa leucostigma*. I have never heard it called California scab, and think this is a very poor name for an insect which is so free-moving as is the larva of a moth. This larva transforms into a moth, the male of which has an expanse of wings of one-eighth inch, while the wings of the female are very small vestiges, and are so inconspicuous as to escape observation by many persons, and consequently she does not look like a moth, wings being absent. It is a very destructive pest, especially on the shade-trees of cities, as it feeds upon a great many kinds of trees, and is too often allowed to go unchecked until it has destroyed the foliage of the tree and become a general nuisance by its abundance. However, it has many enemies, both in the insect world and among birds. It has many internal parasites which help in holding it in check; and certain birds, such as cuckoos, feed upon it readily. The tussock-moth larva feeds upon the foliage of maple, horsechestnut, and other shade-trees, and becomes easily the most serious pest of these trees on some village or city streets. The life history is interesting, and is as follows:

The larvæ feed until they reach a length of

MAP SHOWING DISTRIBUTION OF BEE DISEASIS IN MASSACHUSETTS, AND POSSIBLE SOURCES OF INFECTION FROM NEIGHBORING STATES.

Re-engraved from Bulletin No. 75, Part III., by Burton N. Gates, Bureau of Entomology, Washington, D. C. See editorial in last issue, page 869.

over an inch, when they seek a place to form a loose cocoon of silk holding together the hairs which they cast from their bodies. Within this loose silken and spiny cocoon, which, as you say, is often found on the sides of the trees, may transform into a chrysalis, and there remain, either during the entire winter or during a few days in midsummer, as there are two broods per year. After they emerge from the chrysalis the males fly; but the females remain clinging to the old cocoons, where they lay masses of eggs covered with a white frothy substance, which hardens and partially protects them. When these egg masses hatch, the little caterpillars which hatch out crawl to the green foliage of the trees and first eat very small holes in the leaves, but later devour practically the entire leaf, almost stripping the trees and causing considerable damage.

As they are leaf-eaters, or feed by chewing their food, they can be killed by arsenical sprays with certainty. For this purpose, where a spray-pump is available it is possible to use one-half pound of Paris green in fifty gallons of water, or three pounds of arsenate of lead in the same amount of water. However, it is not easy to spray large shade-trees, and it is more desirable to destroy the pests while in the cocoon or egg state by touching them with sponges fastened on the ends of long poles and dipped into oil. Common kerosene or coal oil will do for this, but it would be well to have it blackened by the addition of tar or some other pigment in order that the cocoons that have been touched may be stained, so that the operator can see at once which he has treated, and work more rapidly without having to repeat his work as he goes around the trees. In order to preserve the parasites it is a good plan to gather the cocoons and egg masses by hand, by using short ladders or step-ladders, and placing them in boxes with wire screens over them. The parasites can come out and be free to escape through the coarse meshes of wire, while if the larvæ would hatch in such a place they would not find the leaves, and perish.

Harrisburg, Pa.

THE LEGS OF THE HONEY-BEE.

BY DR. BRUENNICH.

Every schoolboy ought to know that the bee has three pairs of legs; but not every bee-keeper knows that every leg is a wonderful mechanism and has an apparatus of its own. Let us look at the details of these wonderful parts of our little insect. Every leg consists uniformly of 9 parts and 8 joints. The first is the haunch, or coxa; the second, the trochanter; then come the femur, the tibia, and the foot. The latter is composed of 5 parts, of which the first is the longest. With the exception of the tibia-palmar joint, which al-

lows movements of the palmar in more than one plane, all the joints are constructed like hinges; that is, when one part is fixed, the movement of the other is always in a plane. If the axes of all 8 joints were parallel, the movements of the legs would be very much restrained; but this is not

FIG. 1.—SECTION THROUGH THE BASKET OF THE TIBIA OF THE THIRD OR HIND LEG.

the case, for the axes lie in different directions, which allows the most complicated movements of the leg. It is this construction which has been imitated by engineers, and it can be seen in many branches of mechanics.

The most important joint in any of the legs is the tibia palmar, which shows in each leg a wonderful apparatus of its own. This joint allows movement in more than one plane.

FIG. 2.—FOOT OF THE BEE.

At the end are shown the two claws, and between them, at *a*, the pulvillus.

In the case of insects the skeleton is not *interior*, but quite *exterior*, and consists of the chitinous membrane, or skin, which serves to hold

the members together. Chitin is an admirable material of an exceedingly firm but elastic nature. A description of the leg gives us an idea of the construction of the whole bee. Let us look, therefore, at the reproduction of a section through the little basket of the hind legs, which serves as a receptacle for the gathered pollen, Fig. 1. In this illustration *ch* is the chitinous membrane. At both ends we find the hairs, *h*, which serve to hold the little loaf of pollen. In the interior we are surprised to see, taking up considerable space, the two muscles, *m*, *m*—the first the extensor, the second the flexor, of the foot; *a* is the great air-space from which are discharged the little bronchial tubes, of which we see two in the section *br*. This air-space is separated from the other parts by a very fine membrane

FIG. 3.—FIRST LEG.

e. ti. extensor of the tibia; *F*, femur; *Tr.*, trochanter; *e. ta.*, extensor of the tarsus; *f. ta.* flexor of the tarsus; *Ti.*, tibia; *c.*, cleaning-apparatus *Ta.*, tarsus; *P.*, pulvillus.

which serves for the exchange of gases—namely, oxygen and carbonic acid. The oxygen is brought by the bronchus from the outer air and penetrates the membrane to go into the great blood-space *bl* which surrounds all inner organs and gives them food for their labor. Inversely goes the carbonic acid, which is a product of combustion from the blood into the air-space, or from there into the free atmosphere.

At *n* we see a section of the nerve, which, dividing itself into different branches, gives the impulse of movement to the muscles, and transmits the sensations to the brain or spinal marrow.

The legs are covered with hairs of different size. The hairs of the coxa and trochanter are pinnate. All the legs have on the end of the foot an apparatus for fixing or clinging. There are two claws, each composed of two hooks, with which the bee is enabled to get hold on different objects. Between the claws there is the pulvillus (shown at *a*, Fig. 2), a little bolster secreting a viscous sap. By the aid of the pulvillus the bee can climb a polished surface like a pane of glass.

Let us now look at the most interesting and complicated part of the leg—the

FIG. 4.—LARGER VIEW OF THE TIBIA-PALMAR JOINT ON THE FIRST LEG, SHOWING THE CLEANING-APPARATUS.

FIG. 6.—THIRD (OR HIND) LEG.

tibia-palmar joints. On the first leg it is a wonderful apparatus for cleaning the antennæ and the tongue—Figs. 3 and 4. In the upper part of the palmar there is a semicircular groove fringed with solid parallel bristle. In the end of the tibia there is a little movable operculum which shuts the groove when the palmar is bent toward the tibia. When the bee wishes to clean the antennæ (which it always does before flying up as every bee-keeper has observed, it lets them down a little, puts the first leg over the antenna so that

the latter is placed in the groove; then it bends the palmar so that the operculum shuts the groove and grips the antenna. Then it draws back both antennæ so that they are polished, and all dirt remains on that little half-round comb. The bee does the same with the tongue.

The tibia-palmar joint of the middle leg, Fig. 5, is the simplest. There we find only a little spur which is said to strip off the little loaf of pollen. The same joint of the hind leg is rather complicated, Figs. 6 and 7. It forms a kind of

The basket is not smooth, as with the worker-bee, but covered with fine hairs. Ottenbach, Switzerland.

FIG. 5.—THE MIDDLE (OR SECOND) LEG.
The spur is shown at *a*.

pincers with which the bee can grasp minute objects—for instance, the wax pellets on the abdomen. On the end of the tibia there is a little comb consisting of about 18 bristles, the purpose of which is still unknown. On the palma of the hind leg we find on the worker-bee the “brush,” consisting of nine or ten series of bristles. With this brush the bee gathers the pollen that adheres to the body, or with it cleans the body from dust, etc. Thus we see that the legs of the honey-bee serve not only as organs of locomotion but for cleaning, carrying, etc.

With the drone and the queen the first and second pairs of legs do not differ materially from those of the worker. On the hind leg the brush of the queen and drone consists of finer and quite irregular bristles, and there is no comb at all.

THE ALEXANDER PLAN FOR MAKING INCREASE.

Allowing Colonies to Rear Their Own Queens.

I have been very much interested in reading Mr. Alexander's plan for making increase, and would like to ask him a few questions about it.

How would it do to select a frame or two of capped brood having also some eggs and young larvæ around the bottom and sides, and put it above an excluder with a flight-hole; then when the young queen's eggs begin to hatch, remove the old hive and set the young queen down, when the colony would be ready for extracting or increase, or set the young queen and brood in the lower or old hive, which has now two queens, and therefore is not likely to swarm.

By shaking the young queens in front of the lower hive as soon as they commence to lay we can be sure to have young queens always, without having to look up the old one. They will surely be as good as superseded ones. Some of our best bee-keepers advise letting colonies do their own requeening. I should like to have Mr. Alexander's opinion of these things, and I think there are many others who would also.

Salem, N. J.

HENRY BASSETT.

[The above was referred to Mr. E. W. Alexander, whose reply follows.—ED.]

Friend Bassett does not say, but I suppose he intends to give a ripe queen-cell or virgin for the bees to mature a queen from. Now, this looks all right, and it would be, providing the bees from below would tolerate a virgin so near their laying queen. With us, when we have tried this way of maturing young queens, at least 90 per cent were balled and killed when about two or three days old.

This is one thing I never could accomplish—that is, keep a virgin alive where bees with a laying queen had free access to each queen.

I know some recommend superseding queens by simply letting a virgin run into the hive at the entrance. We have tried this hundreds of times when we had a surplus of virgins, and never, but once, was the virgin allowed to kill the laying queen. If I had a breeding queen worth fifty dollars in a good full colony I would not be afraid to have a pint of virgin queens shaken down at the entrance, for I am sure each virgin would be grabbed and stung by the workers before she could ever meet the laying

DRONE, QUEEN, AND WORKER; PHOTOGRAPHED BY DR. K. BRUENNICH.

queen. As to allowing the bees to do their own superseding, I am decidedly opposed to it. We never can improve them as we should while this miserable method is practiced. There is not a particle of science about it.

FIG. 8.—FOOT OF THE THIRD (OR HIND) LEG.
b, claws; a, pulvillus.

When a colony has two laying queens, and they are separated only by a queen-excluder, and you wish to have both queens occupy the lower hive only, remove the upper hive and also the excluder as carefully as you can, setting them to one side; then remove two or three combs with the adhering bees from one side of the lower hive, being careful not to disturb their queen; then take as many combs from the upper hive with their brood, queen, and adhering bees, setting them carefully in the open part of the lower hive. Replace the excluder and upper hive, doing it all without exciting the bees any more than can be helped. In this way each queen will be for some time with her bees and brood; and when the queens do come together, all will be quiet and natural; whereas if you shake them down in front of the hive, the bees and queen will be much excited, and she will run all through the hive, and you will be quite likely to have one or both queens stung. No, don't shake a queen down in front of any hive if you can prevent it. I have several times seen good queens stung by their own bees when this was practiced. It is quite a trade of itself to know how to handle hundreds of queens and not lose any; for so much depends upon certain conditions that a method that will work all right in one case may be away off in another.

Delanson, N. Y.

PURE FOOD IN NEW YORK.

Commissioner Pearson, of New York, has notified all the makers of ice cream in his State that adulteration will not be tolerated. Pure cream must be used. He could very properly drop a hint of the same kind with respect to honey a little later in the season.

W. K. M.

SIMPLIFIED QUEEN-REARING.

A Plan Adapted to the Needs of the Small Bee-keeper.

BY C. O. FLUHARTY.

I have frequently been interrogated on the subject of queen-rearing by bee-keepers owning perhaps half a dozen hives and desiring to increase the number of their colonies without having them swarm.

In most cases I find that persons keeping bees on a small scale do not care to undertake queen-rearing by the seemingly complicated and tedious methods employed by professional queen-breeders; therefore after trying a number of plans for simplifying this, so as to make it quite easy for even a beginner to understand and execute, I have concluded that the following will be found the most satisfactory method, having thoroughly tested it this season.

FIG. 1.

First, as to apparatus: A frame of the standard dimensions, with the exception that the bars and ends be constructed of one width of material, say one inch. To one side of this frame, firmly fasten with tacks a sheet of wire cloth, tacking it down all around so as to make it "bee-proof;" next prepare another wire cloth in like manner for the other side, but do not tack it on, as it is to be held in place by lumps of beeswax at each corner and at intervals between the corners. Thus we have constructed a huge nursery cage with

FIG. 2.

one side stationary and the other held in place by the wax. Next, fasten a small column of beeswax inside the frame, one end of which attach to the under side of the top-bar while the other end is made fast to the bottom-bar. Fix the ends

firmly to the bars by pressing the wax with the thumbs. The cells are to be attached to this little wax column. See Fig. 1.

Next, mold with a blunt stick or leadpencil eraser some tiny wax cups as seen in Fig. 2, and fasten to the bottom-bar as indicated in No. 2, Fig. 3. These are food-cups. Now roll a piece

FIG. 3.

of wax quite thin, and convert it into a number of little cones, as B and D, Fig. 4. These are to hold the queen-cells as well as to suspend them from the wax column. See Figs. 1 and 3. We now have all the necessary apparatus with the exception of a *very* sharp and narrow-bladed knife for removing cells from frames.

To proceed, first remove the queen from a "boiling-over" hive that you wish to breed from (always select your best stock for this), and place the queen with two frames of her own bees in a new hive, and set it some distance from the old hive. This will, of course, give you a new hive.

The work is now over for about six days, after which, on opening the queenless hive, you will in most cases find from one to twenty queen-cells, large and well drawn out. Now carefully brush the bees from the frame containing the most cells, and, with the knife, cut out all of the finished ones; that is, those that are entirely closed. Next, without shaking the cells, remove as much of the adhering worker-cells as you safely can without breaking the walls of the queen-cell;

FIG. 4.

then insert the cell in the cone which was prepared for it; after this, cement the rim of the cone down tight to the cell with the point of the knife. Now fasten the end of the cone to the wax column, leaving the cell suspended in the same fashion that the bees build them. After preparing as many cells in this way as you will require queens, place the frame back in the queenless hive and leave one side of wire cloth off. After the frame has been in the hive 24 hours the bees will have cemented over every chink quite nicely, they being much better architects than we are.

It is now time to fill the food-cups with honey, and, after making sure that no bees are among the cells, wax the other wire cloth in place; you may

now replace the frame in the hive and await the appearance of your queens.

Now a few words as to the disposition of the queens when they hatch. Divide your bees up by any method you care to follow. The plan which I generally adopt is to remove three frames containing brood and bees, and place them in an empty hive; then carry the old hive to a new site at least 15 feet from where the parent hive was originally located, placing the queenless three-frame colony in exactly the same position formerly occupied by the old hive. Of course, all the flight bees will return to the new hive, which will, by the time a queen is hatched, have become a fine colony well on with the fourth frame of comb. Now watch your cell-cage; and just as fast as you find queens hatched, remove them and drop them (without smoke) right among the bees in the queenless hive. There is hardly a chance of the bees balling if the queens are introduced before they can fly. I have given this a most thorough trial this season, and lost but one cell, it being torn down by a virgin that was left imprisoned for two days on account of my not having a hive ready for her.

Sandusky, W. Va.

[We endorse what our correspondent has to say in reference to queen-rearing on a small scale; that is, it is a mistake for a bee-keeper owning perhaps ten or fifteen colonies to think that he must have a complicated apparatus for rearing his queens. But it seems to us that the plan here described could be still further simplified, and improved at the same time. It requires rather close watching to remove virgins just as soon as they are hatched, and we can not see why it would not be vastly better, instead of placing cells in the cage in the manner described, simply to leave them where they were first constructed until they are ripe, and then distribute them among the nuclei already prepared. This would save all the expense of the cage, of the wax columns, wax cones, etc.; and since it is much safer in the long run to introduce ripe cells than virgins, there would be some saving. In most cases it would be necessary to protect the cells in the usual manner with regular queen-cell protectors, which also provide means for attaching them to the combs.—Ed.]

THE CASE METHOD OF REQUEENING EXPLAINED.

Good Queens Reared Under the Swarming Impulse.

BY WM. W. CASE.

In reply to John M. Davis, page 700, I would say that I do not think I was understood concerning queens reared in swarming time. In the article quoted I was not writing a dissertation on queen-rearing, but a method of procedure to enable many who fail to get a honey crop from weak colonies or from excessive swarming to remedy those conditions and reap a nice profit.

In the first place I did not think any one would infer that I used cells for breeding sealed *after* the colony swarmed, I stating that such cells could be used for seven days, meaning, of course, that the last ones (sealed when the swarm issued)

would hatch by the eighth day, and intending to give the impression that all unsealed cells should be destroyed. Now, by preventing the queen from leaving the hive for two, three, or four days, by traps or otherwise, large numbers of prime sealed cells may be obtained (I have had as many as nine), sealed *before* the swarm has finally been hived. Such cells produce the best of queens possible to get, even though placed in nuclei or even mating-boxes if the temperature is kept right. As a matter of practice I do *not* divide the cell colony into nuclei until about the seventh day.

In defense of my queens, I might say that I went into winter quarters, fall of 1907, with 49 colonies. Two, through an oversight, starved to death; and three, for some cause or other, came out queenless, which, however, were early replaced from the South. On June 18, 1908, 45 of the 47 colonies were working in the supers, covering more than 1500 sections on that date. None were given brood from others excepting the three queenless ones above mentioned, which were slightly aided, one of them now working in the supers, and *none* had the aid of a second queen to reach that condition, but one swarm having issued previous to that date.

I am not rearing queens for sale, and have no ax to grind.

Frenchtown, N. J., June 22.

TWO SEASONS' EXPERIENCE WITH TWIN MATING-BOXES.

Some Data to Show the Economy of a Nucleus Holding Four Ounces of Bees.

BY M. T. PRITCHARD.

[The writer of the following article has charge of our north yard, where, with 200 double baby nuclei, he will rear, in practically three months, 2000 queens — has reared 1500 already. He does not seek alone mere numbers but quality of stock.—Ed.]

A system of record-keeping is used in one of the queen-rearing yards of The A. I. Root Co. which enables us to know at the end of the season just what has been done with each nucleus. Some data taken from these records may help us to decide between small nuclei and nuclei with full-sized frames. Five twin mating-boxes were taken from the storehouse, and an examination was made of the ten records, there being two nuclei in each box, each having two frames one-third the size of a Langstroth frame. They are probably a fair average of the yard.

These nuclei were all started between the 18th and the 27th of June, using four ounces of bees for each nucleus, and they were run until after the first of September. One, however, swarmed July 5, and was given a new supply of bees the same day. The last queens were taken from them Sept. 22. During the season's work with these ten nuclei, 47 virgin queens and 41 cells were introduced; 15 of the virgins were lost in introducing, 7 more were lost at mating time, and the remaining 25 became laying queens. Of the cells, 7 failed to hatch; 2 were lost at mating time, and 32 became laying queens.

After two seasons' experience with the twin mating-boxes I am satisfied that the little colonies will hold their own through the queen-rearing season if started with young bees. Our greatest

trouble has been to keep them from getting too strong and swarming out. I do not think any thing is gained by introducing virgins when the number killed and crippled in introducing is taken into consideration; and I believe that queens mated in these nuclei in favorable weather are fully equal to those mated by any other method.

At the close of the season the bees may be saved by moving the mating-boxes two or three miles from the yard and placing them in groups of 10 to 15 each. Allow the bees to fly from their new location for a few days, then place an empty hive in the center of each group, and in it hang all the nucleus frames that contain brood by putting them into regular L. frames. Brush the bees from the empty boxes in front of the hive, and move them away where the bees can not find them. The bees will unite in the regular-sized hive and make a colony that should winter as well as any if given a queen and plenty of feed; and it will be ready to divide into nuclei again the next spring.

Medina, Ohio.

A FURTHER DISCUSSION OF QUEEN-TRAPS.

The Clipped-queen Plan Preferable; Why Rear Drones? Not Necessary to Lose Swarms with Virgins.

BY A. J. HALTER.

On page 555, of the May 1st issue, Mr. Taylor replies to an article of mine regarding the use of queen-traps. My contentions were based wholly on outyard manipulation versus the clipped-queen system for swarm control.

I do not rear an abnormal amount of drones, and do not find it necessary to obtain chicken feed by catching them or starving them to death simply for a good riddance.

The main objection to the rearing of drones is the feed and space required for their development during the larval state. When developed, the short duration of life is optional with the worker-bees. I believe it is more profitable to requeen systematically from choice stock, thus obtaining a majority of young queens in the hives, which lay fewer drone eggs; then, by removing combs that contain too many drone-cells, when overhauling bees each spring the rearing of drones is kept normal.

Now in regard to the chilly nights and cool spells of rainy weather—was this not the cause of the shortage of honey last season?

June 17th we had a very heavy frost, freezing corn, tomatoes, etc., and on such occasions we certainly prefer to have the queens inside the hives.

Mr. Taylor says he finds clipped queens very annoying by hopping out of hives, and recommends traps for catching queens not clipped when a swarm emerges. I can not understand why a queen with one wing should be more difficult to catch than a queen with two wings when the trap is adjusted.

Several years ago what was called pickled brood appeared in two of my apiaries, mostly among hybrids and in colonies containing an old queen;

but as soon as pure young Italian queens were introduced the disease disappeared. This seemed worth its consideration, and I began to requeen, clipping and marking the ages of each.

I found that queens reared directly after the main flow, which closes about the middle of July, could be relied upon to pass through two succeeding honey seasons with very little danger of being superseded until the main flow was over at the end of the second season. During the latter part of July all queens two years old are destroyed, and a ripe cell is given; but this must be attended to promptly at the time stated; for when supers are removed and bees crowded into the lower story, old queens are more likely to be superseded; and when the first virgin queen hatches a swarm will often issue, in our location, sometimes as late as September, owing to a late flow of nectar. By requeening promptly we have a good force of young bees ready for this flow, which often gives quite a surplus. Those colonies which do not give a surplus generally have enough stores for winter—an item worth considering. The past season I operated about 150 colonies for comb honey, and about half this number of colonies for extracted honey and queen-rearing. During this time there was not a swarm with a virgin queen; nor were any swarms lost by flying away. All laying queens being clipped, the bees returned to the hives. By giving a proper hive-stand, queens will generally return. All told, there were not over ten queens missing during the whole period, including accidents in manipulations.

Were I to rely wholly on queen-traps it would be necessary to have them in use until the latter part of August in this locality; but by clipping queens and requeening, as stated, the swarming period is shortened, and thus I have the benefit of all the bees reared after the first of August, as well as those reared for the main flow.

Akron, Ohio.

J. T. Dunne, Fresno County bee inspector, reports that he inspected 35 apiaries last month. He finds the general condition of the apiaries north of Rolinda and west to the San Joaquin to be in fine condition. Many of the apiaries in this section have been extracted once and some the second time. The flow in this section is principally from the alfalfa. The 35 apiaries under inspection embraced 1910 hives or colonies.—*Pacific Rural Press*.

FOUL-BROOD LEGISLATION IN INDIANA.

Indiana bee-keepers are about to ask their legislature to pass a measure that will suppress both kinds of foul brood, and paralysis, in that State. About a year or more ago they did secure such a law; but owing to a defect the measure was invalid. They propose to try again. The new law proposes the appointment of a State Inspector of Apiaries acting under instructions from the State Entomologist. He is given power to aid in the development of the bee industry, and to afford protection to the bee-keepers by the suppression of bee diseases which now exist in several parts of the State. Indiana ought to have such a law, and have it quick. Mr. Pouder is its sponsor.

W. K. M.

HEADS OF GRAIN FROM DIFFERENT FIELDS

A CAUTION IN REGARD TO GREASY WASTE.

In your comments on greasy waste as a smoker fuel, page 868, July 15, you say, "Two or three bushels of it will last one almost an entire season." There may be a number of persons who read this who will collect this greasy waste and leave it in a box, keg, or barrel; and if it happens to be collected from a shop where lard oil or any animal or vegetable oil, for that matter, is used, as in cutting threads, the waste would probably set fire to the building if it were not discovered in time, as it would catch fire from spontaneous combustion. This might not happen if the oil in the waste is of mineral origin, as that does not oxidize as readily as the other oils. Linseed and lard oil have quite an affinity for oxygen; but as almost all the lubricating oils are compounds I think you should warn your subscribers of the danger of leaving a pile of greasy waste in any wooden building. I have had a small pile of waste in a tin can get quite hot in ten hours in an engine-room, and the oil in the waste was supposed to be a strictly mineral oil, as it was used for lubrication.

Philadelphia, July 28. J. T. FENNEL.

[We have before mentioned the danger of allowing greasy waste to stand in a building, but we neglected to add this caution on the page referred to. Many fires owe their origin to the spontaneous combustion of greasy material left carelessly about. The best place to keep such smoker fuel is in a rain-proof box out of doors, away from any building.—ED.]

WHEN SWEET CLOVER YIELDS.

Is there a season of honey (nectar) flow for sweet clover, as for white clover and basswood, or is it a steady yielder all summer? If the latter, do the bees keep on putting the honey into the sections where there is an abundance of the bloom, or do they get simply their winter stores and living from it? I inquire because I have the right-of-way for a mile on both sides of my place sowed; and as it is now coming up nicely, by next year I expect to have the country covered; for, besides sowing it alongside the railroad track, I have had it scattered alongside the various roads leading out of town.

Buck Grove, Iowa. A. F. BONNEY.

[Sweet clover usually begins to yield nectar shortly after clover and basswood are out of bloom, beginning in our locality anywhere from the first to the middle of July. It continues then to yield nearly all summer. During that time it is freely visited by the bees. While the roadsides and railroad embankments have a large amount of it, it does not yield enough honey to make any showing in the supers, and sometimes not very much in the brood-nest.

In localities where there are only a few colonies and a large amount of bloom, it yields considerable surplus honey. In the vicinity of Chicago a large amount of sweet-clover and white-clover honey is secured. The quality is of the

very finest. If in your locality there are not a good many colonies you will be able to get some surplus, and also enough for winter stores.—ED.]

A GOOD PROTECTION FOR AN APIARY.

To protect the apiary from cold and hard north winds, make a fence from wire netting on the north side of your apiary, and plant some never-freezing honeysuckle plants close to it. In a short time these will grow and climb up the netting from one end to another so tight that no wind will get through, and so the apiary is saved from hard-blowing winds. These flowers will also make a nice appearance, especially when in bloom, as the blossoms are of different kinds, and there are green leaves the whole year. The plant will stand any cold.

By pulling down the wax cloth from one of my hives I saw that there were some holes gnawed in the tops of the frames by bee-moths. Please tell me whether this will do any harm to my bees. The holes are gnawed through the frames so that they can reach the honey. I have the black and hybrid races, but I always keep my colonies strong.

How high must I place my hives to keep frogs or toads from doing any harm to my bees?

New Ulm, Tex. WM. H. KAUTZ.

[If there are moths in the hives at all, it would pay you to Italianize your colonies, and thus be rid of them entirely. We should suppose that hives two feet from the ground would be safe from toads, etc.—ED.]

THE IMPORTANCE OF A SPACING-STAPLE AT THE LOWER END OF THE FRAME END-BARS.

I want to make a strong appeal to the readers of GLEANINGS to put end-spacing staples at the lower corners of frames to save bees from being slaughtered by the score. I am going to get out a petition and get 20 or 30 bee-keepers of New York State to sign it, to the effect that any manufacturer or bee-keeper who does not recommend putting staples, or something similar, on the lower end of the end-bar, to keep from killing bees, be subject to a fine for cruelty to insects, the honey-bees.

You can't take out a set of frames from a populous colony having no staple or other protection on the lower corners in three or five minutes without injuring or maiming 20 or 30 bees. If you raise one end of the frame $\frac{1}{4}$ inch higher than the other you crush or maim some bees and occasionally a queen.

Groton, N. Y. W. L. COGGSHALL.

[Any one can put staples on his frames if he prefers. Manufacturers are willing to furnish what bee-keepers demand.—ED.]

MATURE BEES DYING IN THE SPRING.

Complying with your request, page 703, June 1, I will give the experience I have had with bees dying in the spring.

Last year I had my bees in a canyon at the foot of the mountains. They were in good condition, and seemed to do well for some time after I set them out in the spring; but about the last of May I noticed a great many dead bees in front of the hives, and this continued probably a

month, during which time the bees dwindled instead of gaining strength. At this time a kind of wild foxglove (*Digitalis*) was thick, and blooming all over the foothills. I thought that probably the honey from this or some other plant caused the trouble.

I visited Hermon Rauchfuss, near Denver, in May, 1903, when his bees were dying the same as mine did last year, only worse, I think. We walked over the hills, looking at the honey-plants; and, if I remember rightly, there was much of this foxglove. I. W. BECKWITH.

Lander, Wyo., June 12.

SOME OPINIONS IN REGARD TO THE PROPER WEIGHT OF FOUNDATION TO USE IN SUPERS.

In answer to the request in *Stray Straws* of June 15 I wish to say that I use thin super foundation altogether in sections, also a half-sheet of thin super in the brood-frames, this latter with wire. I prefer this way, as I find it very economical. Of course I am a beginner here in the Ozark.

E. C. BAKER.

Sylva, Ark., June 22.

PREFERS EXTRA THIN.

I prefer the extra-thin, and have used nothing else for several years, using last season over 75 lbs. I shall use as much again this season. I began the use of the thin when commencing bee-keeping a number of years ago, and changed to extra-thin on account of the too heavy midrib. However, I never had my attention called to it by a customer; but I could tell it easily, and expected to hear from it. I got 20 lbs. of thin foundation this year for frame foundation, and my daughter cut up a 5-lb. box of it into section starters by mistake (full sheet and bottom starters), so I shall have a chance to test it once more, and may report later my findings.

I have used a good deal of extra-thin foundation in shallow extracting-frames (full sheets), and with a heavy colony. In hot weather the foundation stretches and buckles considerably between the wires unless the Miller splints are put in.

Regarding the bees gnawing foundation, no doubt they will gnaw the extra thin a little worse than the *thin*; but not enough worse, I think, to counterbalance the difference in the quality of the finished section honey. F. W. HALL.

Hull, Iowa.

I use extra-thin foundation for sections, as the thin is too heavy, and bees will not draw it out when working fast.

BURT SLEASE.

Roswell, N. Mex.

I use extra thin in full sheets because it is always advised. About 2 per cent of it is torn down or eaten full of holes. We find it impossible to put in full sheets of extra-thin foundation with a hot-plate fastener in February and have it stick until given to the bees. Half of it will be loose. Would thin foundation be better?

Diamond, Pa.

A. J. MORSE.

[The thin would undoubtedly stay better.—Ed.]

I have used both the thin and extra thin, and find that the thin foundation is the better. I use thin altogether now, for the simple reason that bees will not tear it down as readily as the extra thin. I have talked with both veteran and amateur bee-keepers on this subject, and they all favor the thin foundation for the reason given above.

There is another reason for using thin foundation, and that is, it is easier handled in warm weather, and it will not topple over when used as a bottom starter according to the Miller plan.

Beardstown, Ill.

H. W. DOERR.

GOOD PRICE SECURED FOR BULK COMB HONEY; WHAT CAUSES MOLD?

I got 25 cts. per lb. for all my honey. How is that for chunk honey? Is it possible we are going to get some of the benefits the glucose-factories have been enjoying for years?

It was very warm here in January, and I thought I would look in my hives. I opened one and took out a brood-frame with about 6 or 8 lbs. of honey, and the rest of the comb was empty, and green with mold, and water or sweat was running off the honey. There were no bees on this comb. I should like to know what caused it to turn green, and how to remedy it.

If I take two or three brood-frames filled with brood in all stages, and put them in a hive, will the bees rear a queen if there is no queen-cell on them when you take them from the parent hive?

Will a colony of bees winter in a shallow extracting-super, or would it be better to give them two supers to fill up for winter? Will bees winter in an eight-frame observation hive in this climate?

H. W. CRONE.

Ansted, W. Va.

[Combs will become moldy if left in the hives over winter when there are not enough bees to cover them. As a rule, it is best to have no more combs in the hive than the bees can occupy. The tendency to mold is greater when the hives are in a damp cellar or when the weather is damp and foggy.]

If there are eggs or very young brood in the combs a queen could be reared by the bees on the two or three brood-frames that you would select for your nucleus. The best way, however, is to provide such a nucleus with a queen-cell that is nearly ready to hatch.

A colony of bees might possibly winter in a shallow extracting-super, but we think it would be much better to provide two supers or sections instead of one. If an observation hive is well packed, and if other conditions are normal, a colony ought to winter well, even though the sides of the hive were made of glass. Rather more packing, however, will be needed.—Ed.]

YOUNG WORKER BEES IN QUEEN-CELLS.

In going through a colony of hybrids that had swarmed, cutting out all the queen-cells but one to prevent after-swarms, I found three queen-cells with worker-bees capped up in them. There were these three chances for the single cell to leave them queenless. These cells appeared as large and perfect in shape as any.

Duluth, Ga.

C. BUSH.

OUR HOMES

By A. I. ROOT

Bless the Lord, O my soul; who forgiveth all thine iniquities,
who healeth all thy diseases.—PSALM 103:3.

May the Lord be praised for the health, strength, and enthusiasm he has seen fit to give me as I look out this bright morning, August 1, on the work he has for me to do. There have been so many inquiries in regard to getting health on Terry's plan of uncooked food, or on similar plans laid down by other writers, that I have been beseeching Terry to write a brief little book or pamphlet outlining the way in which he secured most perfect health after the doctors had told him he had only a little while to live. But Terry is so busy he thinks he can not get at it—at least not just now. I finally told him if he did not write such a book on the subject I might undertake it myself (to be given away), and I feel just like starting it this morning. In other words, I feel that God has given me a message to be given to suffering humanity; and I feel so sure it is his message that I really enjoy the idea of giving it free to all who may want it, "without money and without price."

I should like to say, as the prophet did, to those who have suffered from poor health and a lack of enthusiasm, "Ho, every one that thirsteth! come ye to the waters, and he that hath no money; come."

I have had this whole matter in mind, as you may remember, for many years. In fact, I have prayed over it again and again; and when people have come to me for advice in regard to remedies I have often prayed over the matter before giving an answer. Several times in years past I have thought of recommending some of the medicines I had tried, and which I thought for a time were beneficial; but it seems as if the Holy Spirit bade me be careful. When the grown-up sons of Jesse were presented to the aged prophet Samuel he thought they would do very well. But Jehovah said, "Not so," and finally directed him to the shepherd boy David. Well, I have reason to feel that I have been directed much in the same way in recommending remedies. I can with a clear conscience recommend to you all the things I have called "*God's medicines*;" and, even though other remedies such as are used by our physicians may be all right at the proper time, I do not feel at liberty to recommend any of them. The outdoor, the pure water, the fruit that comes right from God's own hand, and the delicious and health-giving grains, are all *God's gifts*, and I feel no hesitancy in recommending them.

On page 955 of our last issue I told you that the three young growing boys declared they felt better, and their strength held out better, when they ate just shredded biscuit and milk in place of an elaborately cooked meal. Well, the boys seemed to have such a preference for the shredded-wheat biscuit that I commenced using it myself; and I have been eating it more or less three times a day ever since. As Mrs. Root thought we *must* have meat and potatoes and other things we are accustomed to have, I for a time ate a little of the other things, then finished up with my biscuit and milk. Finally I decided one morn-

ing to have just two shredded biscuits and a cup of milk, and nothing else, for my breakfast. It is true I did not feel quite satisfied, but I thought I would stop right there and see how my strength held out till noon. It held out a great deal better. When I went to take my nap just before dinner I did not feel nearly as much in need of food as usual. But I slept soundly, my mouth did not taste bad at all when I woke up just at dinner time, and I felt especially clean and well all over. For my dinner I had a little bread and butter, but otherwise about the same as for breakfast, and I have been pretty nearly a month now on this simple diet. Occasionally I have an egg; but, aside from cooking the eggs, I can get along very nicely without any cooking at all—at least in warm weather.

Now, friends, here is a tremendous achievement, aside from the matter of better health. Several times when we have been discussing the difficulty (and almost impossibility) of getting some one to cook, and wash the dishes in the home (it is worse in Florida than here in the North), I suggested that God was striving to teach us some useful lessons. Now, if I have got matters right, or, in other words, if I am truly interpreting the voice of God that speaks within me, the lesson that he is striving to teach us, and that we are so stubbornly refusing, is this: We do not *need* any elaborately cooked meals, with a great lot of dishes to contain different articles of food, for

The pie and cake,
That so much fussing make,
Give one the stomach ache
And send one to the undertaker.

After all I have said in favor of the lean-meat diet in years past, you may think this a rather wide departure. Well, I am not *quite* ready to become a vegetarian. I believe that milk and eggs were designed by the great Father above to be a large part of the diet of the human family. And, by the way, I am very fond of cheese, and I like a little bit every few days; but I shall have more to say about this soon. At present I am eating no meat at all. I do not need it, and do not care for it. I am not using any tea or coffee at all (nor headache powders). I do not need them and do not care for them; and when I feel the strength of mind and body and enthusiasm that I have this morning, I can say, "May the Lord be praised that neither tea nor coffee (nor *headache powders*) have any thing to do with the feeling of elation and enthusiasm that I feel I have." Yes, and I can say, too, that I feel pretty sure that no meat of any kind has any thing to do with it as I will tell you a little later. Now, as I am planning to have quite a talk this morning, a sort of an A B C book on health, I hope you will excuse me if I go into details pretty thoroughly.

THE A B C OF GETTING WELL AND KEEPING WELL.

I have described pretty well my breakfast. I forgot to say that I want a liberal supply of butter with my shredded biscuit. I think the biscuits cost about a cent apiece; and I should need about a cent's worth of butter and about two cents' worth of milk—just think of it; a good square meal for a nickel, and no cooking; no dishes to wash except the teacup and plate, and a

knife to handle the butter. If you want an egg, it can be cooked quickly and easily and nicely on one of the cheap oil-stoves. Terry uses Pettijohn's whole wheat in place of the shredded biscuit, and I have used it until lately. I may go back to that again; but just now the biscuit seems to "hit the spot" better than any thing else. After putting on a liberal supply of butter I chew it a long while, just as Terry directs with raw wheat. By the way, sometimes when I can not get Pettijohn rolled wheat I have tried eating regular wheat, of course picking it over carefully, and then it is all right; but it takes too long to chew it. The wheat grains must be crushed or rolled or ground up in some way to save the labor of chewing. I prefer skimmed milk rather than new milk, because I do not seem to need the cream.* While at my sister's in Manistee I was pleased to find Mr. Gardner was also using the shredded biscuit. His plan was to cover it with cream and mash it down with a spoon. Now, I think it is better for my health to chew the biscuit and butter, without mixing it with either milk or cream, until it is reduced to almost a liquid by the action of the saliva. It is only after a thorough chewing in this way that you get the delicious flavor of the wheat. Terry says he enjoys eating his meals more than those people do who eat a great lot of every thing, including elaborately prepared delicacies, and I can say the same. I always feel happy nowadays when it comes mealtime; and I thank God for the enjoyment that my meals afford more than when I had meat and potatoes, cake and pie, strawberries and ice-cream, to top off with. The strawberries are all right, as I will tell you when I get to it; but the pie and cake and cane sugar are all wrong for me, and I honestly believe it is so with thousands of others. We have a neighbor who makes beautiful salt-rising bread, and I usually have a half a slice of that with my biscuit. The older it is, and the drier, the better I like it; for I can chew it up then just as I do the shredded biscuit. By the way, zwieback answers very well, especially if it is made of whole-wheat bread. If in very poor health, very likely the rolled raw wheat that Terry uses, *well chewed*, will be the best thing for you; but as people differ, we can doubtless, each one of us, make the selection which suits us best; but do not try to eat too many different things at the same meal. If I am correct, Terry finishes up each meal with raw or uncooked fruit. Now, I do not particularly care for fruit in the morning. I do not think I need it; and if I eat it during the day, and eat as much as I want, it somehow seems to make a disturbance. I have also heard that Terry recommends only two meals a day. This might be all right for him; but as our people have long been accustomed to three meals, for the sake of sociability, if for nothing else, I have three light meals instead of two larger ones. We have for years had our supper at 5 o'clock. My supper includes about what I have described—shredded biscuit and a cup of milk. But about 7 o'clock in the evening

I have what might be called a fruit meal—fruit and nothing else. I have told you about how I eat apples every evening just before going to bed, and I can heartily indorse what I said some time ago, to the effect that apples are "the best medicine in the world" for me, and I believe they are also the best *fruit* in the world for me.

Some eight or nine years ago I became enthusiastic over the Yellow Transparent apple. I bought two dozen trees, and not only planted some of them on my own premises but on the grounds of each one of the children; and now we all have those beautiful Yellow Transparent apples on all of our premises. I can not tell you how I enjoy watching our apples grow, and looking forward to a time when they will be ripe and ready to drop. To have an apple just right, you want to get it so it will almost drop from the tree if you just look at it. It is understood around here that we are not to pick the apples from the trees of our neighbors; but after the apples drop on the ground everybody is at liberty to help himself before the chickens get them. I told Mrs. Boyden (Blue Eyes) the other day that her early apples were dead ripe, and that she must gather them. I said to her that one great big beauty of an apple dropped off just because I looked at it. I do not know but some of the grandchildren thought grandpa gave the tree a little *shake* when he looked at it. Well, when these beautiful apples get so ripe that you can sink your thumb into them easily, or so you can almost peel them as you would a peach, it is perfectly safe for me to eat *just as many as I want or care for*. Our people used to worry when they saw me with a great plate of apples in the evening; but they have got over worrying now. With a sharp knife I take off the peeling, but I greatly enjoy eating cores and all. Somebody told me years ago that apple-seeds and the meat from peachstones have a special virtue in helping digestion, and I have reason to believe it is true. They are like nuts, you will notice. By the way, I am not using nuts very much just now. I do not seem to need them; but I do crave and enjoy good rich cheese. When I am eating great quantities of apples, as I am now, the cheese somehow comes in to make a balanced ration. The acid of these apples I have mentioned seems to have a very beneficial effect, especially in warm weather.

A great deal has been said about the value of lemons, and no doubt they are a great medicine; but these rather tart apples, I think, answer the same purpose, and I find they are pleasanter to take. Besides the Yellow Transparent apples, we have the Early Harvest and the Red Astrakhan. The latter, when grown to perfection, is not only a beautiful apple but a most wholesome one. Three years ago I purchased a little tree of Storrs & Harrison, and this summer it bore a good heaping half-peck basketful of beautiful apples. I think I have been eating a great lot of apples every evening for the last four or five years; and if they were deleterious in any way I should certainly have found it out before this time. They are certainly preferable to any kind of physic sold in the drugstores or that grow in the woods or fields, and I find them more pleasant to take.

Last, but not least, I have for some time back made it a point to drink just as much pure water as I can without feeling uncomfortable. I drink

*A friend of mine who is connected with a sanitarium at Clifton Springs, N. Y., says a good many of their patients can not take milk regularly unless it is skimmed. Milk just from the cows, or with all the cream stirred in, seems to be too rich for such people, and I am sure skimmed milk is better for me than the other.

nothing at my meals but a cup of milk; but about two hours after each meal, when I begin to feel thirsty, I take a big drink of boiled cistern water. I prefer it boiled, because the large amount of coal smoke in our vicinity settles on the roofs of even our slated buildings so as to give the water a smoky taste. Boiling precipitates this smoke and dust, and makes sure that all germs are destroyed; and I am pretty sure that boiled water is more wholesome—at least for myself.

In closing let me say something about the lean-meat diet. It is no doubt a fact that many people *can* live on a purely vegetable diet (and perhaps keep in better health on such diet), while others can not. I do not pretend to decide in regard to this matter. I believe a majority of our physicians think a mixed diet is the most wholesome. Those who have charge of the military schools of our government have, I believe, decided in favor of a mixed diet for soldiers; and, notwithstanding what I have said in the above, if I should have an attack of chronic dysentery, just as I have had every little while almost all my life, I think I would adopt an exclusively lean-meat diet for several days until I got over it. This diet which I have prescribed so many times in the past dozen years or more is hardly worth while to go over. What is termed in restaurants a "Hamburg steak" * comes the nearest to what is called the Salisbury treatment. It is just chopped or ground lean beef nicely broiled. Take this and nothing else three times a day for three or four days, and, so far as my experience goes, it will wind up every thing in the line of dysentery or summer complaint.† You will need to get fresh meat for this purpose. Now, our vegetarian friends might be able to furnish me some substitute for the lean-meat diet. Milk toast is very commonly used, and I think I would try the milk toast first. If that will not answer then try the ground meat.

Some have anxiously inquired about garden vegetables. You know I have been a great exponent of gardening; in fact, I have written several gardening books. Well, just now we are having beautiful green peas, string beans, Golden Bantam green corn, etc.; and I occasionally have a small dish of some one of them with my shredded biscuit—not all three of them, and not as much of any as I might feel inclined to eat. I can use almost any of these without any bad results if I make a principal meal of them, and be careful not to eat too many. Nature will handle things difficult of digestion if not too big a dose—especially too big a dose to start with. You can gradually accustom a cow or horse to a change of food; but do not give them too much the first time. It is so with humanity, I am sure. People are made sick by eating honey because they have not had any for a long while, and then all at once they eat a big lot. Notice how the boys

get sick after cutting a bee-tree, or how children eat too much of any thing when they first get hold of it. I eat a great lot of apples and feel better than without them, because I have eaten them for years just before going to bed. In fact, when I am away from home, and am obliged to go without the apples, I do not sleep as well. There seems to be a turmoil in my digestive apparatus because the apples did not come along at just the accustomed time. I told you that I had lost my taste for sugar. I do not care for it, and feel unpleasant after eating it. When I begin to feel hungry for any sweets I find a little honey is better than sugar; but at my age, and with the present condition of my system, I feel better without sweets of any kind. Perhaps if I were a growing boy it would be different.

I have almost taken it for granted that, with the great light and teachings now before us, every invalid is staying outdoors as much as possible, and especially sleeping outdoors, or as near it as can be. Not many days ago I found two people, right in the middle of July, sleeping in a room with all the windows closed. They said they could not open them on account of flies and mosquitoes, and they had not yet got around to having screens. One of them owned up that he was threatened with consumption, and had been for some years. May God help us in our efforts to "spread the gospel" of pure air as well as pure water (and wholesome food), such as God intended we should use.

As this matter of eating fruit is one of the most important things in regard to getting well and keeping well, I hope you will excuse me for going to some length on the subject, and using some very plain talk. A good many say they can not use fruit; but you can if you commence by taking a little at a time, and take it at just such an hour each day. About 7 o'clock in the evening seems to be about the best time for me. Commence with one very ripe mellow apple—one that is rather tart. After a few days you can take two; then take three. It is something like getting used to eating lemons; and you want finally to become sufficiently accustomed to them so that you can eat enough good mellow apples to cause the bowels to move freely the next morning. Eat apples enough or use fruit enough of some kind to have the bowels move surely *once* a day, and if they move twice I think it is still better.* Fruit, especially the apple, such as I have mentioned, seems to have a cleansing power, and also power to neutralize any tendency toward biliousness, such as many people have in warm weather. You can soon determine how much fruit is needed to produce the desired effect. Strawberries, and berries of other kinds, will answer the same purpose, but they are likely to be rather expensive—rather more so than the apples. Now, do not be troubled if this fruit does cost you a little more than you have been paying for your meals. It need not cost you more than beefsteak, and not nearly as much as going to a doctor or buying medicine at a drugstore to cure constipation. Besides the fruit, you will need to drink plenty

*When you go into a restaurant and order a Hamburg steak, tell them you want it without onions. Unless you do they will be pretty sure to serve it with onions; and onions always distress and trouble me.

† You need not think I am recommending something I have not tried thoroughly; for, to tell the truth, at one period in my life I was on the lean-meat diet for 18 weeks, not having even a cracker nor a crumb of bread during all that time. I know from practical experience that one can live and get along very well on either meat alone or on a vegetarian diet alone.

* If this fruit diet should answer better than any alarm clock in getting you up very early in the morning, do not be worried. Getting up early will be a good thing for your health, I am sure, besides the thorough moving of the bowels before taking up the tasks of the day.

of pure soft water, but not at the same time you eat the fruit nor at mealtime. Whenever you feel a little thirsty, drink as much pure water as you can without feeling uncomfortable. In warm weather, Terry says, we ought to drink half a gallon a day; and after carefully observing the matter I am sure that plenty of water has much to do with cleansing the system from any impurity that might otherwise accumulate. All sorts of diseases and aches and pains are the result of letting foul and fermenting matters obtain a lodgingplace in different parts of the system. Of course, you must have also abundant exercise in the open air. No one can "get well and keep well" who is not busy with mind and hand; and he ought to be busy in helping somebody, or in helping along this great busy world where God has placed us.*

GETTING WELL, KEEPING WELL, ETC.

It is refreshing to find that my health notes in the present issue are so well seconded by some of the great doctors. See the following, which we clip from the *Cleveland Press* of Aug. 5:

THE SECRET OF KEEPING COOL.

That is a very simple secret—how to keep cool in summer. It may be told in a few words—live a wholesome life.

And what is a wholesome life for "dog days"? Well, first of all, keep well. Keep clean, inside and out. This means a daily bath, warm or tepid, and the drinking each day of from two to three quarts of pure cold water, taken at times other than with or near meals. It also means attention to the excretions.

Wholesome food for the summer should be light. We need much less food in summer than in winter. Fruits, grains, and cereals, salads, and a little milk or cream—these afford every need for feeding the body and for pleasing the taste. Two meals are better than three, and between meals nothing should be eaten. Spices, condiments, pastries, and all fancy foods should be avoided. Tea, coffee, and tobacco tend to make one feel the heat. Alcohol in any form is a "delusion and a snare." A glass of beer or a "peg" of whisky may make one feel cooler for a time, through paralysis of the nerves. The first effect, however, soon passes, and then he feels hotter than ever. For relief—another drink, and so on.

Lastly, if you want to keep cool in summer, don't worry about the heat; don't talk about the heat; don't, if you can avoid it, even think about the heat. If you will follow these simple rules you will not only be safe and comfortable during the heated term, but will come actually to enjoy, as many do, the "dog days."

W. R. C. LATSON, M. D.

A COMFORTABLE HOME FOR TWO OLD PEOPLE.

While I have been writing a series of articles under the heading of *Our Homes* for the last twenty-five years and more, the consideration of building what is called a home has often come up. When we had a family of five children, before any of them were married we built a brick house that we thought would be about right; and it was about the thing we needed until the children married and moved away. Then Mrs. Root protested about having such a large house to care for. I proposed locking up some of the rooms that are not needed; but she insists that it is almost as much work to care for such a room and its contents as it is to care for an occupied room. She had been talking about a little home that could be cared for with very little work. The

"cabin in the woods" No. 1 filled the bill pretty well except when company came. This little "home" was only 14x20; but with a cheap cloth curtain across the middle, making two rooms of it, and a little kitchen on the back end, it answered very well. When we went to our Florida island we built something on the same plan, only a little larger, and had it planed and painted, inside and out. This answered very well; but as there was no ceiling overhead, and there were cracks where mosquitoes got through, it did not suit Mrs. Root. Accordingly, when we decided on having a permanent winter home at Bradentown, Fla., we spent quite a little time in making diagrams and discussing various matters. We finally settled down on the cottage shown on page 819, July 1st issue.

As several inquiries have come in asking about the interior arrangement we submit the following diagram; and after having lived in the house one winter we find it about right. We discussed

DIAGRAM OF A. I. ROOT'S COTTAGE AT BRADENTOWN, FLA.

having a bungalow instead of a 1½-story house, but it would have cost quite a little more money. Going upstairs and down very much is tiresome, it is true; but when you go to the expense of making a good substantial roof over your head it seems almost too bad that this roof should not cover two sets of rooms instead of only one. Another thing, a house made so nearly square is not very common, but a square building gives one much more room for the amount of material than any other unless it is a round room. The bedroom, as you will notice, has two doors and

*In concluding these health notes I would advise every one interested in what I have outlined to read T. B. Terry's articles every week in the *Practical Farmer*. My own opinion is that the great Father above is leading Bro. Terry to explore regions almost unknown along the line of getting well; and I feel he is enlightening mankind in a matter of more importance than almost any thing else that has ever before come up in the way of relieving and avoiding pain and suffering here in this world.

two windows. In warm weather these doors and windows are always open, so we get a breeze across the bed, no matter what direction the wind blows. All of the windows and outside doors are, of course, well screened with wire cloth. As a fireplace gives better ventilation than any other arrangement ever invented, we had one made, as you will notice, in the very center of the building. There is fuel on our acre of land—probably all we shall ever need. When the nights and mornings are cool, a very little fuel gives the best warmth I have ever found from any source, and at the same time ventilation that is sure and ample. Our carpenter told us to be sure to have the fireplace and chimney entirely disconnected from any part of the woodwork. This makes it safe against fire; and the sagging of any part of the foundation would not cause the plaster to crack. The chimney has two flues clear up to the top—one for the fireplace and the other for the kitchen stove, so there can be no conflict in the draft.

Although most of the houses in Florida are not lathed and plastered, we decided on having the whole house finished in that way; for it is almost the only way to avoid having crevices where flies and mosquitoes and other insects might possibly find a hiding-place.

While we ordinarily have but little use for an upper story, we find it is very convenient when friends come to see us. The upstairs part is done off very much like the one below, except that there is one very large clothespress at the head of the stairs, and two more on the north side of the chimney. We have a very convenient clothespress opening from the little bedroom under the main stairway. The ground is slightly sloping back from the street so that our west or front porch is only about 18 inches above the level of the ground; but on the back side, where the woodshed is, the floor of the house is nearly four feet above the ground. This gives us a chance to have what we call our "balcony," which is a floor with a railing around it on a level with the floor of the house. Then some steps, as shown, go down into the woodshed, and the fuel is piled up underneath this balcony. In one corner I have a work-bench.

Just outside of the door that opens into the woodshed we have a safe covered with wire-cloth for keeping food and provisions secure from flies, and yet where they can get a cool breeze.

Right underneath the window marked A is a hatchway that leads into my incubator cellar under the northeast corner of the kitchen. This incubator cellar is about half above ground and half under. As I explained some time ago, it is made of circular brick such as you use in making a cistern or well. The incubator stands in the center; but as the wall goes up only about 3 ft. to the level of the ground, there is a nice convenient shelf on the ground level for placing various articles so as to have them right at hand without any stooping over.

Now, all things considered, we find this a very comfortable home for a couple of old people; and although it is a comparatively small house, there is room enough for the children or grandchildren when they find it convenient to call around and look in on the old folks.

Some of you may wonder why we did not put

on at least a little ornamental work so our cottage would not look so exceedingly plain. Well, we thought of that, and we may add something of that kind later, especially around the porches. But let me call your attention to the fact that when Ernest and John built their cottages across the way, something over twenty years ago, they paid out a good deal of money for ornamental work over porches, upon the cornices, etc. Well, Ernest has recently had a man pulling down all this ornamental scrollwork, principally because it was full of cobwebs, difficult to paint, and, besides all that, it is all out of fashion. Work that cost a great deal of money several years ago, has been torn down and burned up for kindling-wood; and I believe the general verdict is that the house looks better without it. Mr. Calvert has been doing similar work on his own home; and in remodeling our own porch a few years ago, we took out in like manner a lot of expensive "gingerbread work." Mrs. Root objects to anything about the home that prevents taking a broom or brush and getting out the cobwebs and dust so the whole structure can be repainted, say once in ten or fifteen years, or when needed. I believe a similar reform is being inaugurated in the way of furniture. Instead of having fancy work that harbors dust and spiders, and is difficult to clean, most furniture is now being made plain and simple. Put on a high finish, if you choose, but do not have a lot of complicated ornamental work. Speaking of finish reminds me that our Florida home is all done off inside with what is called the "beeswax finish." Turpentine and beeswax are melted together; then after staining and filling the woodwork, this beeswax compound is put on and rubbed down hard with a woolen cloth until it gives a polish. Woodwork finished in this way is not easily marred by bumping, and a little more beeswax with "elbow grease" will restore any place marred or spotted by accident. Huber had his new house finished in this way, and our large new office where I sit dictating this has all the woodwork finished off with the beeswax composition that I have described. It is cheaper than varnish, and anybody can do it if he is willing to furnish the muscle. Surely bee-keepers ought to be able to adopt the beeswax finish for the woodwork for their homes.

In regard to this beeswax finish I have been describing, all kinds of varnish, or at least most varnished work, is likely to crackle with age, besides showing white streaks where it has been bumped or scratched. This wax finish never crackles, and never shows any white streaks; and is less work to renew it when marred than it would likely be to scrub the painted woodwork with soap and water.

Just a word in regard to porch floors. It now seems to be a difficult matter to find any sort of paint or floor preparation that will stand the weather, especially after snow has drifted in on the porch and melted, or where the rains have beaten in and the water has been allowed to stand for some time on the porch. After studying over this matter we made our porch on the island with narrow boards planed both on the tops and edges, placed $\frac{1}{4}$ inch apart. We liked it so well that our porch in Bradentown was made in the same way. I think the floor boards

were about four inches wide—possibly five. They were planed on the edges; and before laying the floor we stood the boards all up edgewise and painted the edges; and after they were laid, the tops were given a good coat of paint. The great trouble with a floor made of matched flooring is the shrinking and swelling whenever the rain beats in and stands for some time on the floor. Another advantage of a porch with openings between the boards is that, in sweeping or scrubbing, the dust or the water goes right down through, and it is very soon all dried off. I am sure such a porch floor will last much longer than where we have a tight floor of matched lumber. Of course, there should be a little slant outward, although this is not so important with a floor with a slight opening between the boards.

Since dictating the above, Mrs. Root objects to having the opening between the boards large enough to let small articles fall through; and I notice that T. B. Terry, while recommending a similar porch, says we should push the boards up tight together. When they come to shrink this will leave a crack large enough to let the air in and dry out the floor. He says that, where we use matched flooring, the water is sure to get in and rot out the floor much sooner than where there is a crack between each two boards.

OUR "ROBINSON CRUSOE" ISLAND—ANOTHER GLIMPSE OF IT.

We clip the following from the *Southern Ruralist*. As it was written by one of my particular friends (a schoolma'am), it may be of interest to our readers:

Five years ago last month we landed in Manatee Co., Florida, where it is perpetual summer. We settled on a little island two hundred yards wide and eight miles long—the Gulf of Mexico on the west and Sarasota Bay on the east. The gulf is about 1000 miles wide; the bay, one.

There was no one living on the island when we came, and only two other families now, so you see our peaceful slumbers are never disturbed by the hurry and noise of the busy city.

The growth on the island is oak, with leaves green all the year; cedar, cabbage palmetto, sea-grape, rubber, and a great variety of grapes and other vines and bushes. We grow our vegetables in the winter months mostly. There was an abundance of coons, foxes, and wild cats when we first came, and we had to fight our way to save our poultry, and coons are bad yet.

There are six of us children—four girls and two boys. We girls went to school in a little row-boat. We never had any mishap, although the waves toss us about pretty roughly at times.

My oldest sister is lately married, and lives near. I am teaching school, and the two youngest, 12 and 14 years, have to paddle their own canoe.

Father is keeping bees, and raising queens for The A. I. Root Co. and others. He sends his queens by mail in little cages. Our main source of honey is saw-palmetto and cabbage-palmetto. We have extracted over 5000 pounds so far from saw-palmetto. Cabbage is not in bloom yet.

My two brothers and brother-in-law fish. They each have a sail-boat and carry a net 200 or 300 yards long on each boat. When they find a school of mullet they surround them with their nets, pushing their boats with long poles, then they pound on their boats and on the water to frighten the fish, when they will rush into the nets and gill themselves. Then the boys pull the nets back into the boat and take the fish out, when they will be ready for another strike.

Sometimes they come home loaded down—2000 to 2500 lbs. to the boat. Then sometimes they fish all night and do not catch enough for breakfast.

This is a delightful place to live in. The thermometer seldom goes above 94 degrees nor below 40.

We have two Jersey cows and a nice flock of hens. We do not have to build houses for either.

Sea-turtles are crawling now. They come out and dig a hole in the sand and lay from 100 to 150 eggs as large as hens' eggs.

The largest turtles weigh about 400 lbs., but dress only about 60 lbs. of clean meat, which is about as good as Florida beef. They can hardly crawl on land, and are no trouble to catch; and, once turned on their backs, they can never get over again.

Bathing in the gulf is superb—no undertow, and lots of beautiful shells on the beach. We can sit on our porch and see the launches and sail-boats flitting about on the bay, and large vessels on the gulf.

There is an abundance of fish and oysters to be had for the taking, and plenty of shark, stingaree, and mosquitoes to make it interesting. Before coming to Florida we had considerable sickness, but not enough since to need a doctor.

FLORENCE SUMARD.

"LET US QUIT BLING HYPOCRITES."

We clip the following from the *Christian Endeavor World* for June 11:

WHAT MIGHT HAVE BEEN.

The San Francisco *Star* has the following sensible comments on the recent visit of the fleet:

"The \$180,000,000 invested in the war-ships now in San Francisco harbor would irrigate 6,000,000 acres of arid land, and provide homes for 120,000 families, giving to each family fifty acres of land. That amount of money would build a railroad from the Atlantic to the Pacific; and such a road owned by the people and for the benefit of the people would squeeze every drop of water out of the railroads of the country.

"That amount of money would build and equip a national telegraph and telephone system, which, conducted for the people, would squeeze every drop of water out of the privately owned telegraph and telephone systems.

"That amount of money, properly spent, would go far toward relieving the people of the tremendous monopoly burden now resting on their backs.

"That amount of money would build from sixty to one hundred great electric-power plants for the people, and free them from the monopoly that is now skinning them.

"Instead of building more war-ships, isn't it time to call a halt? With tens of thousands of our citizens begging for an opportunity to earn a living, isn't it time to call a halt on this wicked waste of money and energy? If we are going more and more into the war-ship business, let us be honest and pull down our churches. If we are to glorify war, let us quit glorifying the Prince of peace. Let us quit being hypocrites."

We are very glad indeed to see that the *World* gave place to the above; but what I would like to say would be a hearty amen to the above. And, by the way, it would rejoice my heart to hear a hearty amen to the same from every religious paper in our land. Is it not true that we already have too many million-dollar war-ships as well as too many *revolvers*? Let us quit being hypocrites, as the San Francisco *Star* has it, and come out in the open, and demand that this war-ship business be stopped in exactly the same way that we as a people not only demanded but *succeeded in getting*, the motto back on our coins, "In God we Trust." And if we trust in God we certainly do not need to invest 180 millions of dollars in one fleet of war-ships.

OUR \$180,000,000 FLEET OF WAR-SHIPS.

The above was prepared for GLEANINGS several weeks ago, and would have been printed without further comment; but I presented the matter in our Thursday-evening prayer-meeting, and our good pastor, Rev. J. Edward Kirby, put the matter in such a different light that the item was held over. He said that our good President's plan was to make this fleet of war-ships a great messenger of peace. His design was, in fact, to have it do missionary work. The United States has already put a stop to superstition and cruelty in Cuba; but we could do this only by means of our war-ships and brave men. In a like manner the United States, with the assistance of other nations, has just recently begun to demand the cessation of such outrages as they had in China, and the Armenian massacres in Russian territory. It would be a sad thing for us to undertake to restore order and have some heathen nation beat us in our effort to protect the

helpless women and children of other lands in the same way we protect those of our own domain. There is practically no suffering from starvation anywhere in the United States or wherever this nation has sway; but in China and other foreign lands starvation is continually going on, and particularly among helpless women and children. If the United States, in connection with the other powers, could take cognizance of these outrages, and protect the suffering and innocent ones, it would certainly be a magnificent missionary enterprise; and if *nothing else* will give us the ability to do this, let us have a fleet of warships. Our good President is a pusher, and we have abundant reason to thank God for it. He would have to be more than human if he did not, in his pushing, once in a while make a mistake. We rejoice to have a man at the head of our nation who insists on having our laws enforced, even if it be huge corporations that try to trample law under foot.

Let me close this little talk by calling your attention to the importance of attending the weekly prayer-meeting; for this meeting is, in my opinion, the place above all others where questions like the above should be discussed in a kindly and Christian spirit. Somebody said in the same meeting that as good a man as Oliver Cromwell, many years ago, suggested that, while we trust in God, we should at the same time "keep our powder dry."

The *Independent* for July 30 suggests the President is going to extremes in the matter of battle-ships. It says:

Let President Roosevelt initiate a movement that will make the United States the first of the world powers to disarm. That would be an achievement worthy of the Nobel Peace Prize.

USE OF SWEET CLOVER.

The following, by Prof. H. J. Waters, of the Missouri Experiment Station, is a very clear presentation of the case for sweet clover. The writer must be a native of Missouri, because he intends to convince the farmers of the value of this clover by actual demonstration. The article originally appeared in *Hoard's Dairymen* of July 24, which of itself is quite an endorsement, for that journal prints nothing but up-to-date, reliable, and scientific information; moreover, it is read by a great army of scientific dairymen.

We have had some experience with sweet or Bokhara clover. Stock are not fond of it, but will eat it when very anxious for something green. Some have tried to brand this weed as injurious, and say its cultivation on that account should not be encouraged. About that I think this way: Missouri is the banner weed State of the Union, I think. There is no idle land, no vacant places in Missouri, during the growing season. It is all occupied either by crops or weeds. Now, this clover is one of the best soil-builders we have. It will grow on land too poor for cow peas. It will actually grow on land too poor for ragweed. The question is simply this: Shall we have Bokhara clover or ragweed or horseweed on our poor lands—a weed that will build them up or those that will not? In addition to that, ragweed, ironweed, and other weeds do not furnish anything valuable whatever; whereas this sweet or Bokhara clover is one of the best bee-plants there is; therefore we could increase our honey crop with it.

We are making this experiment at our station. There are portions of land in this State, hills so poor that we do not deem them worthy of putting in cultivation. We have been trying a number of plants to see if we can find some valuable plants that will grow on that sort of land. We have tried alsike, red, and Bokhara clover. This is the third year we have tried Bokhara clover on that sort of land. Although it lives two years and dies, it comes from the seed almost every year; and on that land now there is a growth of Bokhara clover four feet high. This clover is gathering nitrogen, and adding to that soil and building it up; and in a few years blue grass will grow on it. Land can be

made in that way, and animals can be supported on land of that sort. On this same land, a little later, red clover will grow, and other clovers. We must do something to utilize our poor lands, and the Bokhara clover, in my judgment, will be the clover that will do that. You will see it growing on the sides of the railroad where cuts have been made, and on the roadside where nothing else grows. I would say that the Bokhara clover is much easier to kill than other weeds. We let it grow two seasons, and the third year there was none left.—PROF. H. J. WATERS.

TEMPERANCE

HURRAH FOR FLORIDA!

We clip the following from the *American Issue* for August 1:

On July 1, Lee County Fla., joined the list of dry counties by a majority of about 150 votes in a total of 700 votes cast. Four years ago the wets carried the county by about 80 votes; two years ago they won by 3 votes. The gradual change in sentiment is typical of the progress being made in Florida.

The voting of this county dry leaves but nine counties in Florida where liquor can be sold at any point; and there are less than twenty saloon towns and cities in the State. Thirty-seven counties are entirely dry.

I wonder if it is really true that there are less than twenty saloon towns in the whole State of Florida. I call attention to this because the *Sunday School Times* some little time ago gave Florida more credit than she honestly deserves. If the above statement is all true I think we can all join in saying, "May the Lord be praised."

THE ORPHAN "PROHIBITION BABY."

I was very much pleased to find the following in the *Chicago Advance*:

THE ONLY PLATFORM.

"The Columbus convention has given the country the only political platform this year in which a majority of the people believe. We have presented the only platform that one voter in a thousand will read. The Democrats and Republicans have held their conventions, and the average voter is not able at this moment to understand what the issue is. It will take speeches of acceptance by Mr. Taft and Mr. Bryan to make up some issues, and when they are made up we are certain they will be factitious issues. Prohibition is an orphan baby. The Republican party looks at it and says, 'I'm not its father;' the Democratic party says, 'I'm not its mother.' They try to raise it on the bottle, and the kid dies. What it needs is a party to take care of it."—*Eugene W. Chapin.*

Of course, the *Advance* put it in quotation-marks, as you will notice, as they are the words of the candidate of the Prohibition party for the presidential chair; but the heading, I take it, is one furnished by the *Advance*. The question now is, "What do you think of it?"

OHIO THE CENTER OF WAR ON LIQUOR.

Developments of the present week make it certain that nothing can stop the fiercest and most far-reaching fight on the liquor question that Ohio has ever experienced. State and national questions and the election of a United States Senator are, to an extraordinary degree, being lost sight of in the controversy over control of the saloon.

The Anti-saloon League has accepted the challenge. From their headquarters the announcement is made that the fight is to be every bit as hot as that waged in the Pattison-Herrick contest of three years ago. "It is the same fight, only more general, and with the shoe on the other foot," says Wayne B. Wheeler, State Superintendent of the Anti-saloon League.

Three years ago the League supported John M. Pattison, Democratic candidate, with all its strength. Pattison was elected, the only man on the Democratic ticket, by more than 40,000, overturning a majority secured by Myron T. Herrick, but two years before, of more than 110,000. In the present contest, which is already sizzling in every part of the State, the League is behind Andrew L. Harris, Republican candidate, and is fighting Judson Harmon, Democratic nominee, at every turn.—*Cleveland Plain Dealer.*

Ernest remarks (in regard to the above) that the only thing we have to fear is the half-heartedness and indifference of professing Christians.

Read His Letter

Read of the economy and profit in this farmer's potato-digging,—how he gets every potato in the field,—how he avoids loss from scarred and crushed potatoes,—how he has made the work easy and fast.

It Tells You how the Acme Hand Digger

ATTACHMENT

proved out under hard, practical actual field use:

Potato Implement Co., Traverse City, Mich.
Gentlemen:—Two years ago I bought one of your Acme Hand Potato Diggers and after giving it a short trial in the field, my sons, who were digging the potatoes, were so pleased with the Acme Digger that I now have five in use on my farm.

The Acme is just the digger we needed. Unlike the machine diggers it digs clean, gets every potato in every hill, doesn't scar the stock, and is not bothered by the vines. The men work easily, yet quickly, and don't get so tired as with ordinary fork or hook digging. I know from my own experience that the Acme Digger does better, easier and cheaper work than any other digger I have seen, and the best recommendation I can give anyone is that I continue to use it on my own farm.

I am, yours truly,

F. LAUTNER, Leelanau County.

Send \$1.00 Today. Let the Acme Attachment prove itself to you. Let it prove that your dollar is better than \$1.00 investment in other diggers—that it will dig potatoes better and more economically—that it is the digger you have been waiting for. *Sent prepaid by express.* Money returned if you had rather have it than keep the digger.

Pamphlet and Potato Book free on request. Send now. Address Bor 520,

Potato Implement Co., Traverse City, Mich.

T. B. TERRY'S HEALTH HINTS

published only in The Practical Farmer each week, have been the means of saving lives and thousands have been helped to enjoy life more than they have ever done before. Send **Twenty-five Cents** to The Practical Farmer, Philadelphia, Pa., and read Mr. Terry's Health Hints **thirteen weeks on trial**. You will be surprised to find how simple a matter it is to get well and strong and keep so. The latest and best that can be given you, together with strong editorials on Agriculture, Live-Stock, Gardening, Home Life, etc. A high class weekly, well worth the subscription price of \$1.00 per year. DO YOU KNOW

That in addition to the regular premiums offered by the EASTERN MAINE STATE FAIR management we offer the list below for the best Apicultural Exhibits aside from our own? The judges will be three practical bee-keepers of Bangor. The dates of the fair are August 25, 26, 27, 28.

For best general bee and honey exhibit, premium A	"	B
" " glass hive of black bees,	"	C
" " comb or extracted honey exhibit,	"	D
" " tancy comb honey exhibit,	"	E
" " beeswax exhibit,	"	

Premium A is a library of bee-books consisting of one copy A B C of Bee Culture, one copy Langstroth on the Honey-bee, one copy Advanced Bee Culture, one copy Doolittle's Queen Rearing.

Premium B is a year's subscription to any three bee paper published in America.

Premium C is any book in A.

Premium D is Root Standard smoker

Premium E is Daisy foundation-fastener.

"Practice Makes Perfect."

A little girl sat on her father's lap, looking into the mirror, and inquired if God made both her father and herself. Being assured that he did she remarked that he was doing better work than he ever did before.

It is simply the old adage over again, and it is true of *The A. I. Root Co.'s* Bee-keeping Supplies; and while perfection can never be attained they are as near perfection as improved machinery and years of practice can well make them. If you have never seen them, or if you have, and have not a catalog, send at once for my 40-page catalog, illustrated profusely, and giving prices of every thing used in the apiary. *It is free for the asking.* Special price list of shipping-cases, and all kinds of honey-packages—wood, tin, and glass. Send a list of what you will need at any time and let us tell you what they will cost you delivered at your station.

Cash or goods for wax at all times.

Select untested queens	\$.75	\$4.00	\$ 7.50
Tested queens	1.25	6.00	10.00
Select tested queens	1.50	8.00	15.00

Safe delivery and satisfaction guaranteed. Send for queen circular—it tells why Highland Farm queens are superior to others. Address all orders to

J. E. HAND, BIRMINGHAM, ERIE COUNTY, OHIO.

GRAY CAUCASIAN QUEENS.

1905-1906 Queen-breeder in Apiary of Dept. of Agriculture, Washington, D. C.

During that time Caucasians were being distributed by the department so that I handled many of the imported queens and bred much of the stock which other breeders are using, and am in a position to furnish the best of Caucasian queens. They are hardy and prolific, but not great swarmers; are builders of white combs, great honey-gatherers, and their extreme gentleness has won for them the name "STINGLESS." Queens are reared from imported mother of gray type. Have three-band or leather-colored Italians also. They are hustlers.

PRICE LIST AFTER JULY 1.				THREE-BAND ITALIANS.			
Untested queens.....1,	\$.75;	6, \$4.25;	12, \$ 8.00.	Untested queens.....1,	\$.60;	6, \$3.35;	12, \$6.50.
Select untested queens...	1.00	5.50	10.00.	Select untested queens...	.75	4.00	7.50.

No bee disease ever in this section.

Descriptive circular and testimonials free.

LESLIE MARTIN, :: Birdcroft Apiaries, :: LEBANON, TENNESSEE.

ITALIAN QUEENS

And nothing but Italians. An improved superior strain is what QUIRIN-THE-QUEEN-BREEDER raises. Stock is Northern-bred and hardy—not a single colony lost during the past winter; have five yards, all wintered on summer stands. Am now taking off supers of nice white-capped clover honey. Prices of bees and queens as per below:

Prices of Queens after July 1.			
	1	6	12
Select queens	\$.75	\$4.00	\$ 7.00
Tested queens	1.00	5.00	9.00
Select tested queens	1.50	8.00	15.00
Breeders	3.00	15.00	
Straight five-band breeders	5.00		
Two-comb nuclei, no queen	2.25	12.00	22.00
Three-comb nuclei, no queen	3.25	18.00	32.00
Full colonies on eight frames	5.00	25.00	

All queens now go by return mail. Safe arrival and pure mating guaranteed. We employ 400 to 500 swarms. Can furnish bees on L. or Danz. frames. Add price of whatever queen is wanted to nuclei or colony. No order too large, and none too small. Over 20 years a queen-breeder. Address all orders to

QUIRIN-THE-QUEEN-BREEDER, Bellevue, Ohio.

ITALIAN QUEENS

Fine young prolific 3 and 6 banded Italian queen, untested, only 75c; extra-fine queen \$1; tested, \$1.25. Full colonies in 8-fr. hive, with queen, \$5.50; 3-fr. nucleus, with queen, \$2.75. Safe arrival guaranteed. Directions to introduce go with queen. Price list free.

J. L. FAJEN, ALMA, MO.

ITALIAN QUEENS

Bred from best stock to be had in the country, and by best methods, insuring beautiful, vigorous, long-lived queens. Prices for 1908:

	1	6	12
Untested	\$1.00	\$ 5.00	\$ 9.00
Tested	1.50	8.00	15.00
Select tested	2.00	10.00	14.00
Breeder	5.00		
Two-frame nucleus	2.25	12.00	22.00
Three-frame nucleus	2.75	15.00	28.00
Full colony on eight frames	5.00	25.00	

Add queen wanted to above.

I shall offer no Caucasians for sale this season.

E. M. GRAVES, Ioamosa, San Bernardino Co., Cal.

Golden Italian Queens, 75c Six for \$4.00.

Mailed promptly. Safe arrival and satisfaction guaranteed. Circular.

J. B. CASE, Port Orange, Fla.

Westwood Red-clover Queens

Are the bees that got the honey in 1907. Better try them for 1908. Nuclei and full colonies a specialty. Price list on application.

HENRY SHAFFER, 2860 Harrison Ave., Sta. L, Cincinnati, O.

QUEENS of MOORE'S STRAIN OF ITALIANS

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the *Bee-keepers' Review*, Flint, Mich., says, "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, 75 cts. each; six, \$4.00; doz., \$7.50. Select untested, \$1.00 each; six, \$5.00; doz., \$9.00.

I am filling orders by return mail.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

J. P. Moore, queen-breeder, Rt. 1, Morgan, Ky.

Queens

**Colden and
three-banded.**

Wurth's queens take the lead everywhere; have 600 queens; can send by return mail; untested, 60 cts. each. Send for circular.

DANIEL WURTH, Rt. 3, Fayetteville, Ark.

W. H. Laws says that, while his trade is very satisfactory, and about as large as he can handle, yet he does not want you who are new to him to forget that the very best of honey gatherers and a square deal is what you will always get when you buy Laws queens.

You should try his strain of Red-clover Long-tongue Italians, one firm alone having bought over 3000 of the Laws queens in the past six years; and more than half the queens sold this season are sent to customers who have bought in former years. A long string of testimonials testify to their merits, and you will make no mistake in buying Laws queens.

Single queens, \$1.00; 6 for \$5.00. Some very fine breeding queens on hand. Safe delivery and satisfaction guaranteed at \$5.00 each. Address

W. H. LAWS, Beeville, Bee Co., Texas.

ITALIAN QUEENS BY RETURN MAIL OR MONEY REFUNDED

Warranted, 75 cents each, six for \$4.00; tested, \$1.50 each. Circular free.

D. J. BLOCHER, PEARL CITY, ILLINOIS

GOLDENS, 10c.

Send 10 cts. (silver) for cage of living bees, **HARDY GOLDENS**, and examine before ordering, if you care to see the most beautiful race on earth. **C. Oscar Fluhrty, Sandusky, W. Va.**

GOLDEN-ALL-OVER and RED-CLOVER ITALIAN QUEENS

My stock is the result of years of careful selection, and is equal to any in the country. The prices are only such as to insure long-lived, prolific queens, whose workers will be hardy and good honey-gatherers. Write for 1908 circular. PRICES.

	1	6	12
Untested	\$1.00	\$5.00	\$9.00
Select untested	1.25	6.50	12.00
Tested, \$1.75 each;			
select tested, \$2.00 each.			

Positively all orders filled in rotation.

Long-tongued

Red-clover Queens

Bred by their Originator

Do you want to get some specimen queens of the world famous red-clover stock of Italian bees? Then buy from me, because I am the originator, and surely ought to know how to breed them in their purity. When you get them from me you know you have the real strain. For years I have devoted time and skill to this stock, trying to reach perfection. I can submit many splendid testimonials in favor of this stock to show my work has not been in vain. Try them, and YOU will be pleased also. I endeavor to please the practical man looking for definite results in dollars and cents. Many years' experience as head apiarist of The A. I. Root Co. enables me to fill the most exacting order with complete satisfaction to the purchaser. Let me show you how well I can please you.

ISAAC F. MILLER, :: Reynoldsville, Pa

Convention Notices.

The seventh annual report of the Illinois State Bee-keepers' Association has been published. It contains the last report of the National Association, and also the Chicago Northwestern. Members of the Association receive a bound copy free. Bee-keepers can secure paper-bound copies for 25 cents by applying to the secretary, Mr. Jas. A. Stone, rural route 4, Springfield, Ill.

NOT A CANDIDATE.

I note that a call has been made for a postal-card vote nominating candidates for election to office in the National Association, and, in this connection, let me ask my friends not to vote for me for any office—other duties are too numerous to allow me to do justice to an office.

W. Z. HUTCHINSON, Sec. N. B. K. A.

A WORTHY ENTERPRISE.

The Worcester County Bee-keepers' Association, of Massachusetts, intend holding their third annual exhibition in the Horticultural Hall of Worcester, Sept. 14, 15, 16. The exhibition is free to all, and there are no entry fees to be paid by the exhibitors. Prizes in money, bees, queens, and supplies will be given. The competition is open to New England except for numbers 25, 26, 27, 28, 29, which are open to the world. All exhibits must be in the hall by noon, Sept. 14.

There will be a semi-annual session of the Nebraska State Bee-keepers' Association held in Lincoln during the State Fair. The meeting will be held on Wednesday evening, Sept. 2, at 7 o'clock, at the bee and honey house on the State Fairgrounds.

All bee-keepers in attendance at the fair should be present. There will be interesting discussions, exchange of practical experiences, and renewal of acquaintance. Come to the fair and see one of the best honey exhibits displayed in any of the central States, and enjoy a meeting of one of the growing State bee associations.

LILLIAN E. TRESTER, Sec.

Lincoln, Neb.

NOMINATION NOTICE.

Each member of the National Bee-keepers' Association is requested to mail, by postal or letter, to N. E. France, Platteville, Wis., on or before Sept. 30, 1908, his nominations for candidates for the offices named below, to be voted on at the regular December election.

President; Vice-president; Secretary-Treasurer; General Manager; three Directors. Oct. 1 the General Manager and one disinterested member will count the nominations and publish results in all American bee-papers. Each member should send in his nominations early. N. E. FRANCE, General Manager.

A CHANGE DESIRABLE.

The bee-keepers of West Virginia ought to get busy with the officials of the State Fair, which is to be held in Wheeling, Sept. 7 to 11. We have read the premium list, and so far as we can find out not a cent is appropriated for bees, honey, or beeswax. Belgian hares are given a place, but bee-keeping is a far more important industry than rabbit-keeping in the war-born State. It seems to us this oversight ought to be corrected at once. West Virginia is one of the best States in the Union for bees, and this ought to be recognized by the fair officials; besides, a liberal premium list will draw out exhibits which will prove a decided attraction to the visitors.

WHO WILL BE PRESENT AT THE NATIONAL?

Often, after a National convention is over, more than one man has said, "If I only had known that Mr. Brown was going to be there, I would have gone." Now, before the coming of the convention I wish to publish in the bee-journals a list of all those who are going to be present. I presume I shall not be able to learn one-fourth of those who will go, but, so far as I can learn, I'll give the names— Now, will you have the kindness right now to take a postal and tell me if you are going or, if you should decide later that you are going, let me know, and it may be the means of your being able to meet some friend that you otherwise would not have seen. W. Z. HUTCHINSON, Sec. N. B. K. A.

PREMIUMS WANTED FOR HONEY DISPLAYS AT THE NATIONAL.

In the Sun Palace at Detroit, Michigan, where the National convention is to be held October 13, 14, and 15, is a large room, 40 or 50 feet across, the sides of glass, and I hope to see this room well filled with a display of supplies, bees, honey, wax, etc.

Of course, the advertising that comes from a display of goods will amply repay any dealer for making a display; but in order to bring out any display of bees, honey, and wax, there must be some inducement, some premiums offered, and, of late, it has become the fashion for dealers to offer some of their wares as premi-

ums, in consideration of the advertising that comes to them from the mention of their names, as the announcements appear in the program that is published in all of the journals, sent out in pamphlet form to all of the members, as well as distributed and used at the convention.

I am now making up the program, and take this public method, that none may be overlooked, of asking dealers to write and let me know what they can contribute in the way of premiums. I would suggest that premiums be offered something as follows:

Best and largest display of single-comb nuclei of different varieties of bees, accompanied by queens, condition of bees, purity of race, and beauty of hives to be the competing points.

Best ten sections of comb honey, completeness of filling of section, evenness of surface of comb, completeness of capping, freedom from travel-stain, and general neatness and appearance to be the competing points.

Best ten pounds of liquid extracted honey—quality and manner of putting up for the market to be considered.

Best ten pounds of granulated honey—quality, including fineness and smoothness of grain, and manner of putting up for market, to be considered.

Best ten pounds of beeswax—color, texture, and beauty of the cake or cakes in regard to shape to be considered.

The most important, late apicultural invention that has not before been awarded a premium.

If there is some other object upon which a dealer would rather offer a premium he is at liberty to do so. If you prefer, you can simply say what you can offer, and please make it as liberal as you can, that we may have a big display, and then allow me to place the premiums as seems best.

Plint, Mich.

W. Z. HUTCHINSON, Sec. N. B. K. A.

THE SIXTEENTH NATIONAL IRRIGATION CONGRESS.

This event will take place at Albuquerque, N. M., Sept. 29 to Oct. 10, and promises to be the greatest in the history of irrigation. Vice-president Fairbanks will open the convention, and Secretaries Wilson, Garfield, and Cortelyou have promised to be there. The chief of the Reclamation Service will also be present. Quite a number of distinguished men will attend the sessions, and speak. Several s' de trips will be arranged for visitors—among others, one to the \$8,000,000 dam at Engle, N. M.; another to the Grand Canyon, and still another to the Tonto dam in Arizona. The convention will make history for the Southwest.

W. K. M.

SPECIAL NOTICES

BY OUR BUSINESS MANAGER

THE TOEPPERWEIN WORD CONTEST.

Some of our subscribers have evidently failed to notice the brief announcement made on p. 732 of our June 15th issue as to the result of this contest, in which we gave the names of the twelve highest on the list. We beg to advise further, that, in accordance with their previous announcement, Messrs. Toepperwein submitted to us the list of words from the first prize-winner, with a request that we publish the same; but as it reached us rather too late for the issue intended, as had been announced, we decided to return the list to them, and this was done; but the list was lost in the mails to San Antonio, Texas. Messrs. Toepperwein then took the matter up with the first prize-winner, Edna L. Crocker, requesting her to send a duplicate of the list, to which she replied by telegram that she was unable to furnish such duplicate. It then being out of the question to furnish a copy of this, which disappeared between our office and San Antonio, Messrs. Toepperwein requested us to publish the second list, containing 435 words. It is their impression that this list was sent to us, and they asked us to return it to them. Strange as it may seem, we can not discover that it was sent to us, nor can we recall positively that it was not; but at any rate, this second list, at this writing, is not to be found either. There seems to be no question, however, as to the awards made as published in our issue for June 15, page 732, although it would, perhaps, be a satisfaction to some of the contestants, more than one thousand in number, to have a copy of the list. If it is possible to do so we will obtain a list of the words, 435 in number, and publish it in a later issue. The name of the second winner is now practically certain, and the award will probably go to the party now claiming it. We do not know of anybody claiming 435 words aside from one party who has written us a number of times on the matter. In conclusion we wish to absolve Messrs. Toepperwein from any blame in the matter of not publishing the list, as they left it somewhat with us, and it did not occur to us that there was any necessity for it; and now when we try to discover the list we can not locate the same. While there is very unusual interest taken in this (greater by far than any one anticipated), we do not feel disposed to allow such a competition in our columns again.

WAX CRAFT, BY T. W. COWAN.

We are now in position to take orders for the above book. It is elegantly bound and beautifully printed. See review by W. K. Morrison elsewhere in this issue. Price \$1.00, prepaid anywhere.

THE ALEXANDER STRAINER PAIL.

Since Mr. Chalon Fowls spoke so highly of the Alexander strainer honey-pail that we illustrated in the new A B C and X Y Z of Bee Culture, page 177, we have decided to make them and offer them to the public, believing they will fill a long-felt want. We reproduce the cut here for the convenience of our readers. It is nothing more nor less than a skeleton pail with

sides and bottom filled in with a very fine milk-strainer wire cloth, 60 meshes to the inch. This screen is small enough to catch even the smallest particles of dirt or wax. These pails are well made, and we can furnish them at the introductory price, at least, of \$3.00 per pair. A wire cloth of such mesh is quite expensive and the labor of making considerable; we can scarcely furnish it for less. As soon as we can determine whether there will be sufficient demand to make it pay in sufficient quantities, the price can be reduced.

Special Notices by A. I. Root

In response to the kind invitation of W. Z. H. on page 1024, I would say that, Providence permitting, I expect to be present at the National convention in Detroit, Oct. 13, 14, and 15.

GOD'S MEDICINE—MORE ABOUT IT.

We clip the following from the *Cleveland Plain Dealer*:

A woman of 107 years, who died the other day, says she owed her long life to the ripe fruit she ate.

We should be very glad to get further particulars in regard to the above—especially if this good woman's favorite fruit was ripe apples, and if she ate them every evening a couple of hours before bedtime.

UNCOOKED WHEAT AND OTHER GRAINS FOR CHICKS AND HUMAN BEINGS.

Every one who reads the poultry-journals will notice there has been a great revolution of late in regard to the diet of poultry. The testimony is overwhelming in favor of dry food—no more mixed messes with water or even milk, and no cooked food of any kind, especially for baby chicks. Give them "baby chick food" and nothing else, and water to drink. Milk is all right, but do not stir it up with other food. And now the world is just beginning to discover that what applies so well to chicks applies also to human beings.

THE A B C OF GETTING WELL AND KEEPING WELL.

The matter in this issue, and perhaps some more added to it, is to be printed in pamphlet form to be given away. If you will send a stamp to pay postage we will send you just as many copies as you need to give to ailing friends. If they should be the means of giving health to suffering humanity, the knowledge of it will be better pay for me than any pay that might come in the way of dollars and cents. So do not be backward about asking for as many of them as you can use, where you think they will do good.

LEAN BEEF AS A MEDICINE.

Since the matter on page 1014 was printed I was greatly pleased to learn that our family physician had recommended to a patient, who could not take milk toast without pain and distress, to eat nothing but scraped beef, nicely broiled, for several meals. He said good lean beef prepared in this way is easier of digestion than any thing else he knew of, and could be taken safely where the patient could not stand milk at all. It has taken a good many doctors a good while to get hold of the idea that lean meat is sometimes, at least, a very valuable medicine.

FLYING-MACHINES UP TO DATE.

I suppose most of you have noticed by the daily papers that my predictions are coming to pass. Farnam has been making a series of successful flights here in America, and Wilbur Wright has also made two or more successful flights in France. We have not heard from De la Grange and the "June Bug," but the thing is now so well started that flying-machines will probably very soon be an every-day occurrence, even if they should *not* be as plentiful as autos, right away. God grant that they do not duplicate the number of accidents that are being daily recorded with automobiles in the hands of those who can not be satisfied with a moderate and reasonable speed.

SO-CALLED NON-EXPLOSIVE GASOLINE-CANS.

There are certain people who are canvassing the country, offering for sale gasoline-cans for which the claim is made that gasoline or kerosene, after either has been stored in the same for twenty minutes or more is rendered non-explosive. Scientific men assure us there is no known method of making gasoline or kerosene non-explosive; and, furthermore, the so-called electrical arrangement in some of the cans does not produce electricity at all, even if said electricity could exert any influence (which it does not) in rendering the gasoline non-explosive. The fact is, it is very difficult to make gasoline explode in *any* can. If any one has any doubt of this, let him take a can of any sort, pour in gasoline, shake the can well, and try to explode it. All it will do, probably, will be to show a pale-blue flame at the opening of the can when ignited. No amount of shaking or spilling of the burning fluid will cause an explosion. The vendors of the so-called "chemical" denaturizing cans, knowing this, are able to perform what has seemed like wonderful stunts. If any reader wishes to try these experiments, let him do the lighting at the end of a ten-foot pole, for gasoline will explode when the conditions are just right.

A "CHICKEN BIBLE."

MR. A. I. Root:—For six years I have been an amateur bee-keeper in a small way, and the A B C book has literally been my "bee bible" every hour of that time. I can't express the enjoyment and profit the reading of it has afforded me. Now, I want to go into the chicken business. Is there a "chicken bible" published anywhere that will do for me what my "bee bible" has done? I am glad to say I am with you on the liquor question, and enjoy the articles in *CLEANINGS*. I have voted the Prohibition ticket for 16 years. The saloon is the great American monstrosity.

F. A. COGSWELL.

Swaledale, Iowa, Aug. 5.

Friend C., I thank you for the very high compliment you pay the A B C book; and I hope our poultry friends will excuse me when I say that, from my point of view, there is no poultry-book that covers that whole subject as thoroughly and exhaustively as the A B C book does that of bees. There are some very valuable books on poultry that were published several years ago; but to have such a book up to date it would have to be kept standing in type just as our bee-book is, so that a new edition could be issued every two or three years. Some of the best articles and best advice I have found are in the large expensive catalogs sent out every year by the manufacturers of incubators. Among others I will mention the Cyphers catalog. The book entitled "An Egg-farm," that we sold for so many years, started out in its first editions with more energy and enthusiasm than any other poultry-book I ever got hold of; but in the last edition, by the O. Judd Co., the writer has introduced such a multitude of cogwheels, wires, and other machinery, the book is so complicated that any real practical poultryman would say it was entirely out of the question. Now, I shall be very glad indeed to have our readers who are conversant with poultry literature tell us what book or books to recommend to such people as our good friend Cogswell.

CLASSIFIED ADVERTISEMENTS

Notices will be inserted in these classified columns at 25 cents per line. Advertisements intended for this department can not be less than two lines, and should not exceed five lines, and you must say you want your advertisement in the classified columns or we will not be responsible for errors.

Honey and Wax for Sale

FOR SALE.—5000 lbs. of clover and amber honey in 160-lb. kegs. C. J. BALDRIDGE, Homestead Farm, Kendaia, N. Y.

FOR SALE.—Fancy well-ripened clover extracted honey, packed two 60-lb. cans to case, 9½ cts. per lb. (New cans.) GEO. SHIBER, Randolph, N. Y.

FOR SALE.—2000 lbs. white-clover honey, mostly comb, heavy, well ripened. What am I offered? J. M. MOORE, Holden, Mo.

FOR SALE.—5 tons of fine-quality comb and extracted. State amount you wish, and we will quote you our lowest cash price. QUIRIN-THE-QUEEN-BREEDER, Bellevue, O.

FOR SALE.—Choice white extracted honey, mostly clover and raspberry mixed, in new 60-lb. cans. Price on application. Sample, 10 cts. JAMES MCNEILL, Hudson, N. Y.

FOR SALE.—Fancy clover extracted honey in new cans, two in a case. Send 10 cts. for sample, which may be deducted from first order. EARL RULISON, Rt. 1, Amsterdam, N. Y.

FOR SALE.—No. 1 clover comb honey, 4x5 plain sections, in best no-drip cases, 14 cts. f. o. b. cans here. If you want "gilt-edge" Michigan clover honey, write me for price on large quantity. L. E. EVANS, Onsted, Mich.

FOR SALE.—Write for prices on clover, basswood, and buckwheat honey in 60-lb. cans and kegs; also comb honey and beeswax, all guaranteed to be pure. W. L. COGGSHALL, Groton, N. Y.

FOR SALE.—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts. J. P. MOORE, Queen-breeder, Morgan Ky.

FOR SALE.—Clover and raspberry honey; also basswood honey; well ripened, rich body and delicious flavor; extracted from capped combs. Two 60-lb. cans (120 lbs. net), \$10.75. Ask for sample if a choice article will please. F. B. CAVANAGH, Boscobel, Wis.

FOR SALE.—New crop of fancy white-clover extracted honey, thoroughly ripened on the hives before extracting. None of better quality on the market. Put up in barrels, new 60-lb. tin cans, and smaller packages if desired. For prices, etc., address EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

FOR SALE.—Our own production of comb honey, 4x5 plain sections, No. 1 quality, at 16 cts. per section. Our comb honey won every important premium in the State last year. If you have a place for some "gilt-edge" comb, write. E. D. TOWNSEND, Remus, Mich.

FOR SALE.—3000 lbs. extracted white and Alsike clover honey in 60-lb. cans, two to the case, cured and ripened in the hive for weeks; thick heavy body; just as good as a specialist can produce. Price 9 cts. per lb. on car at Pittstown. Sample 10 cts., which will be deducted from first order. ALBERT G. HANN, Rt. 1, Pittstown, N. J.

FOR SALE.—150 cases of No. 1 comb honey, 15 sections in 3-inch glass, no-drip cases, 6 cases in a crate, very fine, at \$2.40 per case, f. o. b. cans here. Also 8000 lbs. clover and basswood extracted, in new 60-lb. cans, 2 in case, very heavy body and fine flavor, at 9c, f. o. b. cans here. Sample free. W. H. TOWNSEND, Hubbardston, Mich.

FOR SALE.—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 9½ cts. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order. LEONARD S. GREGG, 711 Amon St., Elletts, Mich.

It is just as I expected! The bees are now, this 21st day of July, gathering basswood honey, and piling it on top of the raspberry. It will be raspberry and basswood honey mixed this year. Then about the time this August 1st GLEANINGS reaches you we will be extracting. Rich, ripe, and rosy will be the kind of honey I will have for sale this year. Some of it has been on the hive 60 days. Doesn't it make your mouth water to think of it? It will be put into bright new shiny 60-lb. cans that you can see your face in. I am asking 10 cts. a pound for this delicious honey—just a little more than it takes to buy the ordinary kind. Ask for a sample, and be convinced.

E. D. TOWNSEND, Remus, Mich.

Honey and Wax Wanted

WANTED.—25 tons of fancy comb honey. Write, stating particulars, to C. M. CHURCH, New Kensington, Pa.

WANTED.—Comb, extracted honey, and beeswax. State price, kind, and quantity. R. A. BURNETT, 199 South Water Street, Chicago, Ill.

Breeding queens of pure Caucasian and Carniolan races—price \$3.00. Order from A. E. Titoff, Expert in Apiculture, with Russian Department of Agriculture, Kieff, Russia. Remit with orders. Correspondence in English.

TIN HONEY-PACKAGES

FIVE GALLON (60-lb.) SQUARE CANS.

A five-gallon can is the favorite package for shipping extracted honey. There is no shrinkage and consequent leaking, no taint to the honey from wood as is so frequently the case with barrels and kegs. The cans, being made square, economize space, and are easily boxed. They are used exclusively in the far West.

SMALL SCREW-CAP CANS.

Besides the five-gallon square cans we list also the three smaller sizes—1, $\frac{1}{2}$, and $\frac{1}{4}$ gallon. These are furnished with

1 $\frac{3}{4}$ -inch lined screw cap like the five-gallon cans. We can also supply the five-gallon cans with 4-inch screw as well as the 1 $\frac{3}{4}$, at 5c each extra; and with an 8-inch screw at 15c each extra. Latter is largely used in Texas for chunk honey. Price of cans packed in boxes or crates given in the list below.

PRICE LIST OF SQUARE CANS.

Box of	1	5-gal. can	(60 lbs. capacity)	\$.55;	10 boxes, \$ 5.00.	Weight per box	10 lbs.
" "	2	5-gal. "	(60 lbs. "	) .85;	" " 8.00.	" "	15 "
" "	10	1-gal. "	(12 lbs. "	) 1.50;	" " 14.00.	" "	20 "
" "	12	$\frac{1}{2}$ -gal. "	(6 lbs. "	) 1.50;	" " 14.00.	" "	20 "
" "	24	$\frac{1}{4}$ -gal. "	(3 lbs. "	) 2.40;	" " 23.00.	" "	25 "
" "	100	1-gal. "	(12 lbs. "	) 11.00;	" " 105.00.	" "	110 "
" "	100	$\frac{1}{2}$ -gal. "	(6 lbs. "	) 9.00;	" " 85.00.	" "	80 "
" "	100	$\frac{1}{4}$ -gal. "	(3 lbs. "	) 7.00;	" " 65.00.	" "	60 "

SCREW-CAP HONEY-GATE AND CAN-SCREW WRENCH.

Screw-cap gate, 15c; by mail, 18c Screw-cap wrench, 10c each; 75c per doz; by mail, 4c each extra.

We furnish the gate for 1 $\frac{1}{2}$, 1 $\frac{3}{8}$, or 1 $\frac{1}{4}$ screw. Other sizes made to order from caps you may furnish.

The wrench fits a 1 $\frac{1}{4}$ screw, and can be used on 1 $\frac{3}{8}$ or smaller by a bushing between cap and wrench.

When you order these gates separate from cans we can not guarantee a fit unless you send us a cap from the screw with the order.

FRICTION-TOP CANS AND PAILS.

For packing honey in small tin packages we know of nothing better than package here shown. We do not carry these in stock, and offer them only for direct shipment from factory in original packages as indicated.

1-lb. can,	2 $\frac{1}{4}$ x4,	from Maywood, near Chicago, in crates of 1155 at \$25.00 per crate.
2-lb. "	3 $\frac{1}{4}$ x4 $\frac{1}{2}$,	" Hamilton, Ohio, or Davenport, Iowa, in crates of 588, \$15.00 per crate.
2 $\frac{1}{2}$ -lb. "	4x4 $\frac{1}{2}$,	" " " " " " " " 462, 14.00 " "
3-lb. "	4 $\frac{1}{2}$ x4 $\frac{1}{2}$,	" " " " " " " " 420, 14.50 " "
5-lb. pail,	5 $\frac{1}{2}$ x5 $\frac{1}{2}$,	" " " " " " " " 220, 12.75 " "
10-lb. "	5 $\frac{1}{2}$ x7 $\frac{1}{2}$,	" " " " " " " " 116, 9.50 " "

Send all orders to Medina for unbroken crates as indicated, to be shipped direct from the point indicated only. The 1-lb. to 3-lb. have no bail, while the 5 and 10 lb. have a wire bail.

CARTONS for COMB HONEY

We are now prepared to furnish these cartons in several styles and in two grades of stock; also in various styles of printing. We can also execute special designs in quantities on special orders. Let us know your wants.

The Danz. open-end carton will enclose a section and pack in the regular shipping-case. We furnish it for 4x5x1 $\frac{3}{4}$ and 1 $\frac{1}{2}$, 3 $\frac{3}{8}$ x5x1 $\frac{1}{2}$, and the several widths of the 4 $\frac{1}{4}$ section. To hold the carton in place on the section you need a rubber band around it. These bands are not furnished with the cartons except at an extra price, and only when so ordered.

The folding carton is of a different pattern from those heretofore furnished. They tuck in

at the top and bottom in a neater form, and are without tape handle. Sections packed in these cartons require shipping-cases made a little larger than the regular sizes, but such cases do not require glass. Some of our agencies have on hand some of the old style cartons in some sizes, which may be supplied on orders unless otherwise specified. These cartons are furnished for all regular sizes of sections; namely, 4 $\frac{1}{4}$ x4 $\frac{1}{4}$ x1 $\frac{3}{8}$ and 1 $\frac{1}{2}$; also 4x5x1 $\frac{3}{8}$. Other sizes furnished in quantities on special order.

PRICE LIST OF CARTONS.

Danz. carton, regular size, plain or printed name blank, 50 cts. per 100; 500, \$2.25; 1000, \$4.00. Weight, 4 lbs. per 100.

Folding cartons, regular sizes and grade, plain, 60 cts. per 100; 500, \$2.75; 1000, \$5.00.

Folding cartons, regular sizes and extra quality, plain, 75 cts. per 100; 500, \$3.25; 1000, \$6.00.

Extra for printing stock design, name and address blank, 50 cts. per 1000 one side; 75 cts. both sides for each color.

For inserting name and address in design at same printing, add 50 cts. for any quantity. For printing in name and address in a stock design, after that has been printed, add 50 cts. for 100; 75 cts. for 500; \$1.00 for 1000. Such cartons can be supplied only from Medina. Special designs or printing quoted on application.

AIKIN BAGS FOR CANDIED HONEY.

These are of tough paper coated with paraffine. Honey should be poured into them just as it begins to thicken by granulation.

1-pound bags,	3 $\frac{1}{2}$ x5 $\frac{1}{2}$,	per 100, \$	.65;	500, \$3.00;	1000, \$5.50.	Weight per	1000,	10	pounds
2 "	5 x7 $\frac{1}{2}$,	" "	.80;	" 3.75;	" 7.00.	" "	" "	18	"
3 $\frac{1}{2}$ "	6 x9 $\frac{1}{2}$,	" "	1.00;	" 4.75;	" 8.75.	" "	" "	28	"
5 "	7 x 10,	" "	1.20;	" 5.50;	" 10.50.	" "	" "	35	"
10 "	10x10 $\frac{1}{2}$,	" "	1.50;	" 7.00;	" 13.50.	" "	" "	45	"
Printing name and address extra,		" "	.30;	" .75;	" 1.00.				

May be sent by mail for 18 cts. per pound for postage and packing.

Candied-brick Honey-wrappers.

We have developed a good trade in choice candied honey cut into 1 $\frac{1}{4}$ -pound bricks, like a piece of butter. These bricks are wrapped in parchment paper, placed in a folding carton, and a fancy white wrapper printed in gold with end-labels put on the outside. We can supply the parchment wrappers, cartons, and labels complete ready for use at \$7.50 per 1000 sets. With your name and address on the wrapper add \$1.00 per 1000.

ASHLAND PUMP AND HAY TOOL WORKS

PORTER BEE-ESCAPES

HIVE ESCAPE

When taking off surplus this is the greatest saving device. It does away with the shaking of the heavy supers, the cruelty of excessive smoking which causes the bees to uncap their honey and start robbing. Just tip the super to the angle of 45 degrees and insert the board. In a few hours it is free of bees; then take off your super. You can as well afford to be without a smoker as without the Porter Bee-escape.

PRICES

Each, 20 cts.; dozen, \$2.25; postpaid. With board, 35 cts. each; \$3.25 per 10; by express or freight.

TESTIMONIALS

They are perfect in action.—British Bee Journal.

No bee-keeper can afford to be without them.—Prof. Cook in American Bee Journal.

Worthy of highest commendation.—Eugene Secor, judge on awards, World's Fair, Chicago.

I would not do without them even if they cost five dollars apiece.—W. Muth-Rasmussen, Independence, Cal.

They are absolutely perfect. I can not tolerate my own make since using them.—John S. Reese, Winchester, Ky.

They are one of the best things ever brought into any apiary, and should be used in every bee-yard in the whole world.—Wm. McEvoy, Foul-brood Inspector, Ontario, Canada.

There is no robbing or fighting or disturbance in the apiary when the surplus honey is taken off with them. They are simply perfect.—W. Woodley in British Bee Journal.

HOUSE ESCAPE

To be used over the doors and windows in the extracting-house, or any place you wish to clear of bees. The most persistent robber can not return. Some bee-keepers make a practice of taking off the filled supers and stacking seven or eight in a pile. The Porter Honey-house mounted on a board makes the best kind of escape. Don't wait till to-morrow before you get a supply. You can not afford to be without them longer.

PRICES

Each, 25c; dozen, \$2.75; postpaid.

TESTIMONIALS

The Porter bee-escape clears the supers of bees so perfectly and quickly and easily that it makes the taking off of honey a pleasure instead of a dread as in former years.—G. M. Doolittle, Borodino, N. Y.

The removal of full honey-boxes has become an amusement since we began using the Porter bee-escape.—Ed. Bertrand, Editor Revue Internationale d'Apiculture, Nyon, Switzerland.

This number of the Review contains more unqualified praise of the Porter bee-escape than any other issue has ever contained of any other implement; but so long as it is deserved, who cares?—Bee-keepers' Review.

They are the greatest thing on earth for expelling bees from supers.—G. J. Flansburg, South Bethlehem, N. Y.

I would not be without them for four times what they cost.—Dr. W. A. Tufts, Musson, La.

Undoubtedly the best bee-escape is the one invented by R. & E. C. Porter.—W. S. Pouder, Indianapolis, Ind.

Bee-men are certainly behind the times if they can afford to use them and do not.—M. H. Mendleson, Ventura, Cal.

Don't Buy a Stove or Range Until You First See How Much You Save By Getting

"A Kalamazoo Direct to You"

TRADE MARK REGISTERED

YOU want to make every cent you spend this year, **count for quality and economy.**

If you need a stove or range, don't buy until you get our **factory prices.** I promise you that I will save you \$5, \$6 or \$10 on our smallest stoves, and as high as \$18, \$20 and even \$30 on our largest. And I promise you that you cannot get **anywhere at any price, a better stove or range than the Kalamazoo.**

Just let me quote you prices. Take our catalogue and **compare the Kalamazoo quality and prices,** with the best line of stoves and ranges you can find sold at retail. **That** will tell the story. You can see for yourself. You want to save money and you want to get high quality. Why not investigate our plan, then? Why not let me show you the difference between manufacturers' prices and retail prices on stoves or ranges?

We sell to you, direct from the factory, at actual factory prices,

On 360 Days Approval Test—We Pay the Freight

I promise, in black and white, to refund your money—every cent of it—if you do not find your purchase in every way exactly as represented.

Remember, every Kalamazoo is of the highest possible grade, made of the best materials and in the best manner. You deal directly with the manufacturers—a company that has a larger number of individual customers than any other stove company in existence. We have sold thousands of stoves and ranges to readers of this journal, and no doubt can refer you to near neighbors who have saved money by buying a Kalamazoo. Many customers write that they have saved enough on a single Kalamazoo to pay for a whole season's fuel. You can save enough to buy a new suit, a new dress, an article of furniture, or perhaps to pay your taxes. Is it not to your interest to get our prices?

Send Postal for Catalogue No. 416

describing more than 300 sizes and styles of Coal and Wood Ranges, Coal and Wood Heaters, Hotel Ranges, Base Burners, Laundry Stoves, Etc.

I know that if you get our prices—and see our quality you will not even think of buying any other make. Let me show you how much you can save.

NEW LUMBER

Bought at Forced Sales from Manufacturers. It makes our Headquarters for Thousands of Genuine Bargains in Lumber and Building Supplies. We save you money.

**FIFTY MILLION FEET
AT REDUCED
PRICES**

**BIG
SPECIAL
SALE**

SAVE 30 TO 60 PER CENT. BUY DIRECT. BUILDING SUPPLIES OF EVERY KIND

The Chicago House Wrecking Co. Purchased at forced sales, 50,000,000 feet of new lumber. We are making special concessions to those who buy at once. Our prices today are far lower than prices have been for years. Order now for immediate or future use. Quick action will save you big profits. Remember prices elsewhere which are even now high, are bound to rise. We can quote you 30 to 60 per cent better prices for the same lumber than your local dealer. We guarantee every carload to be exactly as represented. Closest inspection of our lumber stock invited.

Call at our warehouse and yards at Chicago and see the lumber we are offering and you will recognize that it is all we say of it. Make your own selection and see it loaded. It is not necessary to come to Chicago, however, unless you wish to. We can fill your order by mail with just what you want and guarantee you absolute satisfaction. Ours is the largest direct to the

consumer lumber headquarters in the world. We sell millions of feet annually. Orders filled from every part of the United States. No matter where you live you can save money by supplying your building wants here.

We do not figure fancy prices, but quote figures that command your patronage. Whether your order is large or small we can save you money on it. Our tremendous business of millions of dollars annually is your best guarantee of complete satisfaction of every purchase made from us. In our enormous stock of new lumber of every kind we have just what you need for every purpose. Don't buy a stick of material until you get our prices. We offer you everything in the lumber and building supply line needed for residences, farm homes, stores, churches, barns, outbuildings of every kind, sidewalks and fencing. In short any kind of a structure requiring lumber, at from 30 to 60 per cent less than your local dealers or lumber yards ask for it.

IMPORTANT! Send Us Your Lumber Bill For Our Estimate

Make up a list of what you need. Send it to us for our price. If you are putting up a building of any kind whatsoever let us figure with you. Our prices talk louder than words. Have your carpenter or contractor send us your list of what is needed if he has charge of your building. Don't pay exorbitant prices to the lumber trust with their long line of lumber yards all over the country. Don't let the local dealer soak you with his heavy profit. Remember: Chicago House Wrecking Company buys millions of feet at a time under circumstances of forced sales which means sacrificed prices and enables us to sell even as low as cost without loss. You take no chances in dealing with the Chicago House Wrecking Company. Whether for \$1 or \$10,000 your order will be filled carefully. Our lumber and supplies are guaranteed exactly as represented. If you have no need for a whole carload yourself get your neighbors to club in with you. By buying a carload you can save all kinds of money on freight charges.

We have railroad trains running through our main warehouses and buildings and can load a car to good advantage to you. You can include in this same car, pipe, plumbing material, roofing, wire, fencing, furniture, hardware and merchandise of every kind.

We also furnish you building and barn plans absolutely free upon request. Write us for any information or advice you want and we will have our staff of architects answer every inquiry promptly. Our free book of plans is sent if you mention this paper. We simplify your building proposition.

Our business demands quick action. We must keep our stocks moving. This means prompt shipment—no annoying delays. Let us help you lay out your plans. We will relieve you of every detail. That is what our Special Builder Service is for. Be sure and send us your lumber bill for our estimate. Feel free to write for anything you want to know along the line of building supplies, furnishings, etc.

Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

EASTERN GRADING-RULES FOR COMB HONEY.

FANCY.—All sections well filled, combs straight, firmly attached to all four sides, the combs unsolled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface solled, or the entire surface slightly solled; the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface solled, or the entire surface slightly solled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

NEW COMB-HONEY GRADING-RULES ADOPTED BY THE COLORADO STATE BEE-KEEPERS' ASSOCIATION.

No. 1 WHITE.—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

No. 1 LIGHT AMBER.—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separated honey to average 21 pounds net per case of 24 sections; no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

No. 2.—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separated honey to average not less than 19 pounds net.

Cases of half-separated honey to average not less than 20 lbs. net per case of 24 sections.

Cases of unseparated honey to average not less than 21 lbs. net per case of 24 sections.

SAN FRANCISCO.—Honey is still being shipped to the markets, but several of the producing districts are now about cleaned out. There is a fair demand in the East, and a liberal movement in that direction, but the local market is rather quiet. The growers are getting from 5 to 6 cts. for average lots of extracted. Sales in this market are made at the following figures: Water-white comb, 16 to 17; white, 15; water-white, extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 5½ to 5¾; candied, 5½ to 5¾. —*Pacific Rural Press*, Aug. 25.

INDIANAPOLIS.—The demand for the best grades of honey is good. Producers are offering fancy white comb honey at 12½; No. 1 white at 12; white-clover extracted, in five-gallon cans, at 7; very little demand for amber at any price. Many bee-keepers seem to be holding their honey for higher prices. Beeswax is steady at 28 cts. cash, or 30 in exchange for merchandise.

Aug. 18.

WALTER S. POWDER, Indianapolis.

NEW YORK.—The new crop of York State comb honey is now beginning to arrive in small quantities, and the quality appears to be very fine, especially choice white stock. While our market has not opened up as yet, and will not before about the first week in September, prices are unsettled and uncertain. We are having some demand for fancy and No. 1 white at prices ranging from 13 to 15, according to quality and style of package. No new buckwheat is on the market as yet, but we are informed that the crop will probably be quite large. A great many bee-keepers seem to think that comb honey ought to sell at the same price as last year and before, not taking into consideration the fact that comb is a luxury and not a necessity, nor do they seem to take into consideration the general depression in business. We do not expect as good a demand as last year, nor do we think that last year's prices can be realized.

Arrivals of extracted honey have been quite free from the West Indies and the South, and the demand is fair. Prices obtained we consider full market value. We quote average grades from 58 to 65 cts. per gallon; fancy grades, 70 to 75. No new crops from near by are on the market yet, nor California. We have several cars now in transit, due here the first of September. We quote California sage at 9; orange, 8 to 8½; light amber, 7½ to 8.

Arrivals of beeswax are quite heavy, and the market shows a downward tendency. Prices are likely to go still lower. We quote 28 to 30.

HILDRETH & SEGELKIN,

Aug. 22.

New York.

SCHENECTADY.—No new comb honey on our market yet, and but little demand, as many dealers carried over some stock which they are anxious to work off before buying the new crop. However, it is well to have some on hand for first customers.

CHAS. MACCULLOCH,

Aug. 25.

Schenectady, N. Y.

CINCINNATI.—Extracted honey, for which there is a fair demand but not a high price, is selling, amber, in barrels, at 5 to 5½; white clover brings 1½ in barrels, 8 in cans; comb honey, for which there is practically no demand, is selling at 14. Beeswax is selling slowly at 33. These are our selling prices.

Aug. 24.

C. H. W. WEBER, Cincinnati, O.

KANSAS CITY.—The demand for comb honey is increasing, and the demand exceeds the supply. No. 1 honey is selling at \$3.25; light amber, \$3.00; dark amber, \$2.75; extracted, 7½ to 8.

Aug. 21.

C. C. CLEMONS & Co.,
Kansas City, Mo.

BOSTON.—We quote: Fancy white-clover comb honey, 16 to 17; No. 1 light comb, 15 to 16; extracted white honey, 9 to 10; extracted light amber, 7 to 8; same in barrels, 6 to 6½. Beeswax, 30.

Aug. 20.

BLAKE-LEE CO.,
Boston, Mass.

DENVER.—The crop in Northern Colorado is almost a failure. There will be but little more than what the home market requires in this section. We quote No. 1 white comb honey, in 24-section cases, at \$3.15 per case; No. 1 light amber, \$3.00 per case; No. 2, \$2.85 per case; strained and amber extracted, 6½ to 7½; light amber, 7½ to 8½; white extracted, 8½. We pay 24 cts. for clean yellow beeswax delivered here.

THE COLORADO HONEY-PRODUCERS' ASS'N,

Denver, Aug. 25.

F. Rauchfuss, Manager.

BUFFALO.—New honey is arriving now quite freely. Quality is very good. Buyers seem slow to buy. They are holding off for lower prices. In order to get it moving, prices must go lower. No. 1 to fancy white-clover comb, 14 to 15; No. 2 ditto, 10 to 12; No. 3 ditto, 9 to 10; white-clover extracted, 7 to 8; ditto amber, 6 to 6½. No dark honey is arriving. Beeswax, 28 to 30.

Aug. 11.

W. C. TOWNSEND.

LIVERPOOL.—The honey market here is steady with a fair demand and a good export inquiry. A better demand is expected next month and October. Stocks in the market are small, chiefly old crop. Values to-day are as follows: Chilean, 4½ to 6½; Peruvian, 3½ to 5½; California, 8½ to 10½; Jamaican, 4 to 5½; Haytian, 5½ to 6½. No change in beeswax.

A semi-monthly. The leading bee-magazine of the world. A glance at its pages will convince any bee-keeper that it is a magazine he can not afford to be without. The information it gives on all questions relating to the subject are invaluable to the bee-keeper, whether he has one colony or hundreds, and even if you are not a bee-keeper you will enjoy reading the paper. Interesting home and garden departments.

This offer is open for thirty days only. All orders MUST reach us by October 1st. Do not delay. Send NOW. Present subscribers to this paper can have GLEANINGS sent to some bee-keeping friend, and the other three papers to their address.

THE A. I. ROOT COMPANY, : : : MEDINA, OHIO

Reasons for the Price

OF MY

Raspberry Honey.

I ask ten cents a pound for my raspberry honey. This is slightly above the market price, but there are reasons.

In the first place, very little raspberry honey is produced. It is a novelty—something out of the ordinary—like orange-blossom honey for instance.

In addition, it is of very superior quality; so much so that it was awarded the gold medal, in competition with other honeys, at the Jamestown Exposition. It has a flavor all its own—a flavor that smacks of the wild red raspberry of the woods.

Another most important reason why I should get a good price for my honey is the manner in which it is produced. It is left on the hives for weeks after it is sealed over, and thus acquires that finish, that smooth, oily richness, that thick, rich deliciousness that can be obtained in no other way.

It costs more to produce such honey, there is not so much of it,

and it is worth more than the ordinary honey; just as big Northern Spy apples, streaked with crimson and filled with juicy spiciness, are worth more than ordinary fruit.

As a finishing touch the honey is put up in bright new 60-lb. tin cans, securely boxed, and the boxes bound with iron so that they will bear shipment; in fact, I will guarantee safe arrival in perfect condition.

For a single 60-lb. can the price is \$6.25; for two cans in a case (120 pounds) the price is \$12.00 a case, regardless of the number of cases that are taken.

If you are not acquainted with this honey, send me ten cents and I'll mail you a generous sample, and the ten cents may apply on the first order that you send.

W. Z. HUTCHINSON, Flint, Mich.

A GREAT OFFER.

It is not often that readers of periodical literature are given so liberal an offer as we have presented on page 1038 of this issue. If you desire to get something nice to read during the long winter evenings we suggest that you give this fine offer your earnest consideration.

A FAVORITE RANGE.

In nothing do American housekeepers show greater discrimination than in their choice of a kitchen range. Every woman has pronounced ideas on the subject, and men-folks are not allowed to say a word one way or the other. It is purely a woman's prerogative to select the cooking-range, and she is generally equal to the emergency. She has an ideal in her mind to which a range for home use must be equal, and perhaps a little more for good luck. It must be dependable, economical of fuel, a good cooker, a good baker, and, above all, it must be durable. It is on this latter point that so many ranges fail; and as it takes years to find this out, housekeepers are obliged to select a range with a reputation. Many ranges do very well for a year or two, when they give out entirely, and the owner has to buy a new one, for to repair the old one would be a waste of money.

Young housekeepers have to be particularly careful on this point, as some kinds of iron will last three or four times as long as another kind, though both look alike to the inexperienced.

For these reasons our lady friends, when about to purchase a range, generally visit their acquaintances to discuss the merits and demerits of their cooking apparatus, endeavoring to discover which range is best.

One of the best ranges on the market, if not *the* best, is the Majestic, advertised on another page of this journal. It has been before the public for a number of years, so that its reputation is fully established. The body is made of charcoal iron, which insures durability; in fact, the makers say it will outlast three ordinary cooking-stoves. It is a fine baker at all times. It saves fuel, because it is so constructed as to conserve all its heat. It has a fifteen-gallon reservoir which supplies boiling hot water.

It has had an immense sale, and there are actually hundreds of thousands of Majestics in use throughout the country. In nearly every county of forty States the Majestic ranges are on sale, and this alone indicates its great popularity with all classes and conditions of American women. Further information can be obtained from the makers, The Majestic Manufacturing Co., St. Louis, Mo.

By the Bee Crank.

Lord Avebury is a famous British scientist and beeenthusiast. In addressing a recent gathering of French and English bee-men in London, the daily papers report that he said that his observations had led him to believe that the movements of the bee are not automatic, but they had what Darwin called "a little dose of reason." He called attention to the fact that they have five eyes, two of which are constructed on a different plane from the other three, and he believes that they may have certain senses unknown to man, including the power of seeing rays of light invisible to us.

All this places a bee on a pedestal beside man, who has a larger dose of reason, and who—if he is a real bee-man—proves it by ordering his supplies where he is always sure of getting bright, fresh, clean stock,

and where he gets it before he has begun to expect it, just as Mr. Reynolds did. Under date of July 21, Mr. Clarence Reynolds, of Center, Indiana, writes:

My order was received in good condition. I want to thank you for your promptness, for the goods arrived two days after I sent the order—sooner than I thought it possible for the goods to come.

I carry a full line of Root's goods, and sell at factory prices.

During this month I am offering a discount of seven per cent for cash orders for goods for next season's use. In October the discount will be six per cent. I believe any bee-keeper can benefit himself by taking advantage of this liberal offer.

I buy beeswax and pay highest market prices, cash or trade. When I say cash I mean that I remit the day your wax arrives.

Catalog free.

CONNECTICUT STATE FAIR.

The Connecticut Bee-keepers' Association will give an exhibit of bees and bee products, in connection with the State fair at Berlin, Sept. 15—18. An entrance fee of \$1.00 will entitle the exhibitor to compete for all premiums in this list.

Italian bees with queen	\$5.00	\$3.00	\$2.00
Carniolan bees with queen	5.00	3.00	2.00
Black bees with queen	5.00	3.00	2.00

The largest and best exhibit to govern the above.

The above exhibit to be in single-comb observatory hives.

All queens must be shown with their own progeny.

Largest and best display of bees of various races, in observatory hives	\$5.00	\$3.00	\$2.00
Best 12 sections of light comb honey	3.00	2.00	1.00
Best 12 sections of amber comb honey	3.00	2.00	1.00
Best and largest display of comb honey	5.00	3.00	2.00
Best 12 jars of light extracted honey	3.00	2.00	1.00
Best 12 jars of amber extracted honey	3.00	2.00	1.00
Largest and best display of extr'd honey	3.00	2.00	1.00
Largest and most attractive display of bees, queens, honey, and bee-appliances	8.00	5.00	3.00
Demonstration of live bees	15.00	10.00	5.00

All meritorious exhibits pertaining to bees, not herein provided for, will receive special premiums. Entries close Sept. 8. Address

GEORGE H. YALE,
90 Simpson Ave, Wallingford, Ct.

A HANDY TOOL.

If you are interested in potato culture, as a good many of GLEANINGS' readers are, you will doubtless be interested in the advertisement of The Potato Implement Co., of Traverse City, Mich. We believe their digger is a very useful invention in connection with what is usually a very laborious job—digging potatoes by hand. The makers claim for it that it does not scar or crush the potatoes, and yet it finds every tuber in the row. The machine diggers are likely to fail in particular, so that there is economy in using the Acme hand digger. We believe the manufacturers are sincere in making the offer to refund promptly the money to all dissatisfied customers. They are certainly reliable or their advertisement would not appear here. Weighing the pros and cons of the question, we certainly think that any one of our readers will be perfectly safe in ordering one of these tools if he has any potatoes to dig.

MONEY IN SMALL FRUITS.

We are pleased to have again in our columns the usual fall announcement of W. N. Scarff, of New Carlisle, Ohio. He is one of the old reliable kind, and we are glad to see him successful. Mr. Scarff is himself a practical bee-keeper, and a farmer on a large scale, using 800 acres of valuable Ohio soil. He appeals very strongly to the small cultivator who desires to secure a large return from a small piece of land. To do this he recommends the culture of berries, which yield heavily and give large returns in money, but require much attention which the average farmer can not give. Probably nothing else can be suggested which will dovetail so well with bee-keeping, and we know that many are pursuing this plan. In most sections of this country the demand for berries is never fully satisfied, and hence we feel that Mr. Scarff is pursuing a safe course when he advises bee-keepers to engage in the culture of berries. From long experience he knows the varieties which are profitable, and his advice should certainly be valuable to the inexperienced.

STORRS AND HARRISON.

The above celebrated firm is one of the institutions of Ohio. It is known far and wide throughout America as a headquarters for good nursery stock such as trees, plants, bulbs, and seeds, and also the supplies connected therewith. They have been 54 years in business, and actually use 1200 acres of land in their nursery work at Painesville, Ohio. It is needless to say that we are proud of the fact that their usual fall announcement appears on p. 1088. They keep a full line of every thing pertaining to the orchard, vineyard, lawn, park, street, garden, and greenhouse. The senior member of this firm, Mr. A. I. Root, has bought considerable quantities of nursery stock from this firm in times past, and always with perfect satisfaction. Any one who has had much experience with nursery stock knows how important it is to deal with a good reliable firm. There are many of the other kind, hence the importance of the foregoing testimony.

The California Fruit Products Co., of Colton, Cal., will mail three colored souvenir post cards free to any one who will write them, and also to any friends whose names and addresses you may inclose.

20 AMERICAN GIRLS FREE

Country Girls, City Girls, Western, Southern, and Eastern Girls; Skating, Riding, and Bathing Girls, and many other views of the beautiful American Girl—all free; also a membership to the Post-card Exchange.

This famous set of souvenir post cards is considered the most popular set ever issued. Twenty different views of the beautiful American Girl; all worth framing—the gem of a post-card collection. I want to place a complete set in the hands of every American woman free.

MY SPECIAL OFFER

In order to place *Up-to-date Farming* in your home I will send it to you for **three months for 10 cents**, and include, with my compliments, a **complete set of American Girl post cards**. Every woman should read the family and household pages of *Up-to-date Farming*; the boys will be interested in the stories and puzzles, while the men will read its agricultural and marketing features with much profit.

Remember, 20 souvenir post cards (American Girl set) and a three months' subscription to *Up-to-date Farming*, all for 10 cents (stamps or silver).

Garrett Wall, Up-to-Date Farming, Indianapolis, Ind.

WHAT'S THE USE

OF HAVING FINE HONEY IF IT IS IN POOR PACKAGES?

If you are among the fortunate ones who have secured a good crop of honey, surely you will not be so unbusinesslike as to sell it in second-hand or inferior cases. Your honey will sell far easier in nice new cases or tins. **WE HAVE THEM.**

TO THE
**BEE-KEEPERS
of CANADA.**

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the QUALITY. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, "The best is cheapest."

## STRAY STRAWS

DR. C. C. MILLER

E. W. ALEXANDER, as one of the rank and file, let me salute you on your triumphant march to receive your crown of rejoicing. "Well done, good and faithful servant!"

EDITOR DIGGES made some experiments which showed that, when working on clover, the bee's load rarely exceeds  $\frac{3}{10}$  of a grain of nectar, yielding from  $\frac{3}{20}$  to  $\frac{9}{40}$  of a grain of ripened honey. That means that the nectar is boiled down to  $\frac{1}{2}$  or  $\frac{3}{4}$  of its original weight. The ripened honey averages  $\frac{3}{4}$  grain per drop; but the bee must load up again and again to produce that drop.

THE REPORT of the United States Commissioner of Internal Revenue shows that, during the fiscal year ended June 30 last, there were distilled 119,808,402 gallons of spirits—a decrease, as compared with the previous year, of 14,333,672 gallons. There was paid to the government as revenue on whisky and other spirituous liquors, \$147,550,281—a decrease of \$15,767,038.

LOUIS SCHOLL reports, *A. B. J.*, 236, that he has this year harvested over 40,000 pounds of comb honey, "almost all by his wee little 6-foot-3 self." Good for Louis! [Considering the fact that the season has not been very good in Texas as a whole, makes the record of our 6-foot-3 all the better. This means that our Texas department will be all the richer for the experience which this big crop brought with it.—Ed.]

D. M. MACDONALD, *Irish B. J.*, p. 33, rebels against the idea of having only a bee-space under bottom-bars. He says, "Here, the  $\frac{1}{4}$ -inch, or even the  $\frac{3}{8}$ -inch space below frames is giving place to a full  $\frac{1}{2}$ -inch. Bees respect all the three equally, and it is my belief that they would be as well satisfied with a full inch." Your head is level, my Scotch friend. Some of the spaces under my bottom-bars are  $\frac{3}{4}$  and  $\frac{7}{8}$ , and there is no trouble. Really, the ventilating space is 2 inches, that being the depth of the bottom-board; but an open rack within  $\frac{7}{8}$  of bottom-bars prevents building down. How much more than  $\frac{7}{8}$  the space might be I don't know; but if I live I'll find out.

MR. EDITOR, you say, p. 927, that in baby nuclei, when the queen has filled all available cells she will stick two, three, or five eggs in a cell sure; but are they not all worker-cells? In the case I mentioned, there were five eggs in a queen-cell, and I think no worker-cell had more than one egg. Do you find in baby nuclei queen-cells with more than one egg, and no laying workers present? [No: now that we think of it,

we have never noticed more than one egg in a queen-cell unless laying workers were present; that is to say, under normal conditions there is never more than one egg in a queen-cell, so far as our observation goes. The queen-cell in the nucleus to which you refer must be, therefore, quite an exception to this general rule.—Ed.]

"SWEET CLOVER usually begins to yield nectar shortly after clover and basswood are out of bloom," p. 1010. Sweet clover must be slower with you than here, or else clover and basswood earlier quitters. White sweet clover opened six days before basswood opened here, this year. How long it opened before the close of white clover, I don't know yet—seven weeks at least. Yellow sweet clover was 23 days ahead of white sweet clover, and only seven days after white clover, in opening. [It is evident from what you write elsewhere in these Straws, and from what you have written at other times, that your clover and basswood flows begin and end much later than in our locality. It is not strange, then, that your early flow overlaps that from sweet clover.—Ed.]

A SECTION of honey has been in our refrigerator six weeks. It looks just as dry and nice as when first put in. I wish you would try the same thing at Medina. Because a refrigerator is cool like a cellar, does it necessarily follow that a section in a refrigerator will become weepy in the same way it will in a cellar. [Some refrigerators afford a dry cold, while the average cellar furnishes a damp or wet cold. Then, too, in all refrigerators the temperature is colder than in any cellar. A dry continuous cold of, say, 40° F., or lower, in a refrigerator, will not make honey candy or become watery, while a variable temperature with more or less of dampness of 50 or 60 or even 70° F. will do much damage to comb honey. After all, a room with a dry hot atmosphere, with enough ventilation to carry off moisture, is a far better place for the storage of comb honey than any refrigerator.—Ed.]

MR. EDITOR, you ask, p. 987, what my average yield for this year was. "Was"? Bless your heart, it's not a case of "was" but "will be." For a good bit of honey is yet on the hives, and the bees are still storing, although slowly. We had an immense clover flow, which continued till the clover was scorched by the drouth, no rain to speak of falling from July 17 till Aug. 11. Then a bounteous rain came, and to-day, Aug. 15, we are getting more. If clover revives, and if heart-ease comes in sufficient quantity with its water-white honey, the average will be pretty heavy. I'll be glad to give it later. Just now there are piled up in the honey-room 12,100 finished sections, making an average of nearly 94 sections

per colony, so far. The best yielder has given, so far, 216 sections. It will have to go 84 sections better than that if it matches the champion of the year 1903. I'm a little afraid heartsease will not do much this year, for the drouth was not conducive to a good start.

I WONDER if one of the signs of queenlessness has ever appeared in print. Suppose you have a colony thought to be queenless to which you wish to introduce a queen. There is often a danger that, by some hook or crook, a virgin queen may be present, perhaps reared from a cell that has been missed, perhaps an interloper from elsewhere. If you find honey in pretty much all cells in the brood-nest not already filled with brood, you may feel fairly safe to introduce your queen. If, on the other hand, you find these cells empty, and polished so they shine, ten to one there's something in the hive that the bees respect as a queen. If you find honey in worker-cells, and drone-cells empty and shining, the bees are likely to have been queenless for some time, and perhaps laying workers are in contemplation. [You are orthodox in all you say. We use these signs in connection with other evidences that may or may not be present in determining the condition of the colony; but, strangely enough, very little, comparatively, has been made in print of the fact whether the worker-cells have been filled with honey or are empty and polished up clean. If polished, and no eggs are in them, it indicates that a virgin is present and will probably lay soon. Or the condition may show that a laying queen has just been let loose from a cage and will soon deposit eggs.—ED.]

THE LAZY WAY of introducing queens mentioned on page 987 still proves successful, but beginners should be warned that it will do only with a strong colony, and in hot weather. A queen at the entrance of a nucleus, or even at the entrance of a strong colony in a cold spell, would be chilled. An illustration of the convenience of the plan comes very pat. After I had written the first part of this *Straw* it occurred to me that there were seven queens that had now been imprisoned three days at hive-entrances, and that it was time to let the bees at the candy. The whole job, from the time I left the house till I was back in, took just 15 minutes. As the day is rainy, no bees flying, to have opened up those seven hives, taking off and returning their supers, would have been something of an undertaking. [Introducing at the entrance may require more than hot weather or a strong colony, to be successful. If there is a dearth of honey the situation might be complicated. Elsewhere in these *Straws* you say that honey has been and still is coming in, or was at the time of your writing. Under such a condition a colony is very tractable, and almost any plan of introducing will work. We would not advise beginners, at least, to practice the "lazy way" after the honey-flow, with a colony weak or strong.—ED.]

"WHEN the robbers are once trapped they should be taken to an isolated location or brimstoned. Having once acquired the stealing habit they will do tenfold more damage in a beeyard than they can ever do good." That, on p. 989, is in accordance with the general belief, "Once a robber, always a robber." There's something in

it, but not nearly so much as I once believed. I suppose there are bees which have become so addicted to robbing that the best thing to do with them is to kill them. But the beginner should not get the idea that it is a wise thing to kill any bee he finds robbing. Any worker old enough to be a fielder will rob if conditions are right. But once robbing does not make an inveterate robber. Given the right chance when no honey is to be had in the field, and I suppose that any field bee in my possession would rob. But I doubt if a single bee of mine is such an inveterate robber that its death would be a gain. In the spring I've had more than one case of a weak queenless colony attacked by robbers. If I let it alone till all the honey is cleaned out, no harm will follow, and the robbers will live honest lives ever after—unless some fool bee-keeper puts temptation in their way. If I should fasten the robbers in the hive when it is filled with them, and should brimstone them, it would simply mean the practical loss of a colony of good bees. In harvest time, if a sudden break comes, from rain or otherwise, if there's any chance for it, a bad case of robbing will be started, and robbers will be trying all cracks all over the yard. Next day, with a renewed flow of nectar, honey may stand exposed by the hour, and not a robber trouble. The robbers of yesterday are no longer robbers, but honest bees. The great thing is to avoid offering temptation to steal in a time of scarcity. Same with folks. [What you say is true if a honey-flow is soon to come on. But after the flow, and there is a prospect of a long dearth, then the statement that "a bee once a robber always a robber" still holds good providing, also, there are hives to be opened often, or weak nuclei in the yard. Experience teaches us in our queen-rearing operations that a dead robber is worth much more dead than alive. For the beginner, at least, we still think that a robber-trap should be used for all seasons—especially if his yard is located near a highway.—ED.]

GENERAL MANAGER FRANCE, in a circular of Aug. 10, quotes: "Prices asked for same, 15 cts. fancy comb retail; 12½ wholesale; car lots, 11 to 12; extracted fancy clover, 10 cts. retail; 8 wholesale; 7½ in car lots." I'm afraid, friend France, that this pronunciamento was not sufficiently considered. I don't believe conditions warrant any such tumble in prices. You've had a big crop. So have I. But "there are others." Those who have had failures are not blowing like you and me. Bro. Doolittle says basswood, their great reliance in that locality, was almost a total failure. But the fact is not advertised in big headlines. There's no bumper crop in California. When best comb is 17 in San Francisco, do you think it ought to be only 12½ in Chicago? Nor do honey-market reports in bee-journals support your figures. Look at *GLEANINGS*, page 976. Those who give quotations there are not bulling the market, for they are largely buyers. The average quotation for best comb is 14½, or 2 cts. above you. You see we all have a lot of confidence in you, and I'm afraid that some, trusting your figures, will get less for their honey than they are entitled to. [In our opinion Dr. Miller is right. Let the reader consult the honey market in this issue, as well as the reference on page 976. Apparently, conditions at present

warrant holding for better prices than those mentioned in the circular of Aug. 10. General Manager France is usually right; but in this case we believe he has made the figures too low.—ED.]

## EDITORIAL

By E. R. Root.

MR. LOUIS F. WAHL and bride, of Chili Center, N. Y., spent a day at "The Home of the Honey-bees" on their wedding-trip. Mr. Wahl has done considerable in the way of bottling honey, and he was once one of W. L. Coggs' "lightning operators." Since he has taken unto himself a "better half" he will doubtless make things hum.

We wish the couple long life and happiness.

### OUR SPECIAL ISSUE.

As promised we take pleasure in presenting this our special issue for September, containing articles on preparing honey for market, including the general subject of bottling extracted, and scraping and grading comb honey, etc. The suggestions contained herein for disposing of the crop and preventing a glut at any one point should be given careful consideration. There are some articles on preparing for winter; why some bee-cellars do not give good results, etc., that will be seasonable.

### SELLING BY SAMPLE.

PERHAPS nothing is more exasperating to one than to buy a lot of honey, and then discover that the shipment is far below the quality of the sample. If he has paid cash in advance the matter is made more complicated. A controversy immediately ensues—if not an ugly quarrel. It is sometimes difficult to make an adjustment under such circumstances. Buyers should clearly specify that the goods are to be fully equal to sample or they will refuse to accept them. There is nothing like having a clean-cut understanding in black and white before the honey is delivered.

### THE PURE-FOOD LAW AND ITS RELATION TO HONEY LABELS.

THOSE who are doing a business of bottling honey, provided they bottle more than they produce, should avoid the use of the term "from the apiary of" and substitute therefor the terms "bottled by" or "packed by John Jones, of Honeyville, O." Some bottlers use the term "put up by;" but in the opinion of the Pure-food Commission this term would not pass muster. Nothing definite could be ascertained until a suit were tried and the matter finally settled by the courts. For that reason we advise the use of the terms "bottled by" or "packed by" as being safer.

### BOTTLING HONEY; A SCHEME TO PREVENT A GLUT ON THE MARKET AND AT THE SAME TIME HOLD UP PRICES.

Now that the season is practically closed, it is generally admitted on all sides that there has been a good crop of white clover throughout most of

the clover belt. Through some sections of it, of course, there has been little or no honey, but this does not alter the fact that a large crop has been secured. It would be folly to send all of this honey to the big markets, thus glutting them. With a little intelligent effort much can be done in the way of selling honey around home.

As mentioned elsewhere in this issue, Mr. E. E. Coveyou, Mr. Chalon Fowls, and some few others, are doing the producers a distinct service in that they not only sell their own honey locally, but are able to take a large amount from others, for which they also find a good market at good prices. But the trouble is, the number of honey-bottlers among bee-keepers is very small. They can not and do not pretend to take more than a small portion of the table extracted honey that is produced in this country, especially this year.

Mr. Coveyou, Mr. Fowls, Mr. Pouder, and the rest have done much in creating a local demand for extracted honey in small packages; and what they have done, others can do for their respective localities. It is highly important that this year there be more local sales to consumers direct and to the trade.

The article by Mr. Coveyou, in this journal, and in other papers, explains many secrets of the art of putting honey in small packages. Then there is a chapter or two in the A B C and X Y Z of Bee Culture, under the head of "Extracted Honey," sub-head of "Bottling Honey," that gives many important details on this important branch of our industry.

The point we wish to emphasize is this: Do not rush your honey to the large cities—at least, not after they are oversupplied. Study the art of bottling your extracted, and put up your comb honey in neat attractive cases. The sections should be nicely cleaned and scraped, and carefully graded. The poor ones containing uneven combs should be sold around home in the form of chunk honey.

Place your best goods on sale at your leading groceries, agreeing to take off their hands all that candies, and replace it, as does Mr. Fowls, with fresh goods. Try to make cash sales; but in case you fail to do this, get the grocer to take it on consignment. Charge him with so much honey as if you had sold it to him, and then give him credit for that which he does not sell, and which you will take off his hands.

In the country districts it may be advisable to sell comb honey in the bulk form at so much a pound or quart. Call on the farmer's wife and give her a free sample of your honey to taste; and, while you are about it, do not forget to treat the children. Sell for cash if you can; but if she has not any ready money, take eggs or butter if you can use them. Every opportunity should be made to prevent honey from glutting the big markets.

It may cost a little something to work up a trade, but it is worth going after.

It is very important that those who bottle honey, or sell it to the local trade, be careful that they do not overlap each other's territory. What is a fine business for one man is practically good for nothing for two. This country is so large there is no reason why bee-keepers can not spread out.

HONEY-CROP CONDITIONS; WHY PRICES ON HONEY SHOULD BE STABLE; A LIGHT CROP IN COLORADO AND IN THE BUCKWHEAT REGIONS.

FURTHER reports confirm previous statements that this has been one of the heaviest seasons for clover honey that we have had in years; but, very fortunately for the honey market, there seems to have been a light crop in some important sections of Colorado—namely, at Berthoud, Fort Collins, and Loveland. The season has also been from light to poor in the vicinity of Montrose. The only good report that we have received from the State was from Olney. The western slope of Colorado, as reported in our previous issue, has also had a poor season. Another report, from a large buyer of alfalfa, says that there would at least be a shortage of 25 cars of Colorado comb honey. If true, this would mean that not much of this Mountain State's product will reach the East.

On top of this, in one of the most important districts of New York where buckwheat is produced by the carloads, it is reported that the outlook for this dark honey is very slim. There may not be more than a quarter of a crop. In this same section, also, the clover flow has been very light.

It would appear, then, that the bumper crop of white clover throughout the Northern States west of the Mississippi will not have very serious competition from buckwheat honey, from Colorado alfalfa, nor from Southern California sage.

The season has been good in some parts of Texas, and poor in others; but as the Lone Star State usually consumes what it produces, it will not this year, at least, have any effect on prices Northern States.

Taking every thing into consideration, it is our opinion that the market for clover honey should now be stable at least. There is no reason why it should go lower; but, on the contrary, we should expect it to be a trifle higher, although we do not advise bee-keepers to hold their crops and then rush them off to market at the close of the holidays when prices of honey usually take a slump. It would be too dangerous to hold for better prices.

Old Dame Nature seems to have a queer way of distributing her honey-flows. For example, if the crop has been heavy in Colorado it is likely to be light in the clover regions, and *vice versa*. It is well that this is so; for if the crop were heavy in every portion of the United States, prices would take an awful sag, and it is possible that we might not be able to get them up again to their former level.

There is another factor that should tend to stiffen the market. In a recent trip through Michigan we found the fruit crop had been very light, especially of peaches, and reports are not very flattering for other fruit sections.

There is still another factor. Times generally are improving. We notice by one of the lumberman's journals—an authority on the subject—that it is feared there will be a scarcity of cars, especially when the wheat crop begins to move. With the improvement of times, the scarcity of buckwheat, and of honey generally in the State of New York, the lightness of the Colorado crop,

the failure of the season in Southern California, we may expect but very little competition for the big crop of Eastern clover.

We advise producers to make careful inquiries of the more distant markets, and be careful about shipping honey to the centers already congested, especially if prices are on the sag. Then, as much as possible, they should market around home. If these precautions are taken, the market will begin to stiffen.

We just received a report from the State of Washington, in which it is stated that there has been a good crop there; and one from the San Joaquin Valley, California, in which it is stated that the crop is going to prove to be a "bumper." But remember that the San Joaquin Valley is a comparatively small area, and hence its total output will not be very large. That portion of California seldom produces enough to shade prices in the East.

#### BEE-KEEPING IN THE HAWAIIAN ISLANDS; A VISIT FROM A RESIDENT BEE-KEEPER.

A FEW days ago we had the pleasure of a visit from Mr. James Ritter, or "Brother James," of Honolulu, who is making a visit to this country. He stopped off at Medina for a few hours. He is connected with one of the great educational institutions of Honolulu, the St. Louis College; is a bee-keeper, and one who seems to be well posted as to the development of bee-keeping in the Hawaiian group.

He reports that the industry is carried on very largely by syndicates who own colonies by the thousands. One company of Japanese, for example, owns 4000 colonies. The American Sugar Co. has about 12,000, and so on.

The Hawaiian bee-keeper finds a ready demand for his honey, both in this country and in Europe, especially for certain grades, which are quickly taken up by the baking business of the Pacific coast. On account of some of this honey being a mixture of a product from aphides, cane sap, and the nectar of flowers, the authorities at Washington have refused to allow it to come into this country as honey, but it may be sold as "honey-dew honey."

We had quite a quantity of it, but the bakers in our vicinity would have none of it; but we are informed that it is accepted very readily by the Pacific-coast bakers; in fact, they prefer it to any thing else.

But this is not the only honey that is produced there. At least 50 per cent of all the honey from the islands is mesquite, or, as it is called there, the *algarroba*. It will be remembered that this is a good honey in Texas; and, so far as we know, it is first class in Hawaii.

As the Hawaiian group consists of a number of small islands, large syndicates are able to control practically all of the bee-ranges. Whether this accounts for the fact that there are but few small bee-keepers, we do not know. Certain it is, these big concerns find the production of honey very profitable.

But let no American bee-keeper rush to Hawaii, as he will find a small chance to get a foothold there, probably. The cost of living is comparatively high, and the tenderfoot had better keep out.

It would appear that our bee-keeping cousins of the Pacific are probably the most extensive of any in the world. They are apparently up to date, using modern appliances, such as power honey-extractors and the like.

Dr. E. F. Phillips, of the Bureau of Entomology, Washington, D. C., has recently made a tour of these islands. We asked him to furnish us some articles for GLEANINGS. This he has promised to do, and we hope to have them ready to present some time this fall.

#### CHALON FOWLS, OF OBERLIN, OHIO; HIS POWER-DRIVEN EXTRACTOR, ETC.

OUR readers will remember Mr. Chalon Fowls, of Oberlin, Ohio, as one who does quite an extensive business in bottling extracted honey. He furnishes the local trade in his vicinity for miles around with extracted honey put up in tumblers and bottles. He is always careful to have thick well-ripened honey, mainly of his own production; heats it, and, while hot, bottles it, and then guarantees to take it off the grocer's hands if any of the bottles show any indications of candying. He makes it a business to go around and inspect his goods; and if in any case there are any that show signs of granulating he takes these away and exchanges them for fresh goods. In this way he has developed a fine trade—so large, in fact, that most years he is compelled to buy honey to supply the demand.

Mr. Fowls' family consists of himself and wife, two grown-up daughters, and a son eighteen years of age. Among them they take care of his business very nicely. They run a series of extracting-outyards in connection with the home yard. Like W. Z. Hutchinson, they have a reserve of combs, pile on the supers during the honey-flow, and at the close remove them after getting the bees out with the bee-escape.

Formerly he has been extracting at each of the outyards after the flow, having a two-frame extractor which he hauled around. But this year he purchased a four-frame power-driven extractor with a gasoline-engine, and his two girls are now doing all of his extracting at home. He and his son go to the outyards with a wagon, take off the filled supers that are above the bee-escape, load up, and drive home. The two girls in the mean time are extracting the shallow combs (for that is what Mr. Fowls uses) as fast as he brings them. With the power extractor they can do all the work. They start the engine and then commence uncapping. Two of them uncap most of the time, while one of them puts in the filled combs and removes the empty one and starts the extractor.

At the time we visited Mr. Fowls the weather was quite cool. Honey was very thick, and yet the extractor was throwing it out of the combs comparatively clean, for the engine does not tire out, and through the medium of the slipping belt the reel starts very gradually, so that the bulk of the honey is thrown out before the reel reaches its maximum speed. Then it makes a perfect whirr, and the honey, warm or cold, is bound to come out. The combs are next reversed, when the operation is repeated.

Mr. Fowls said to us that he had heard a good deal about the cleaner and more effective work

done by power extractors; and from his preliminary tests he was almost prepared to believe that the extra amount of honey he saved by the more thorough extracting would pay for the extractor in a short time. This, of course, did not take account of the saving of labor, which is another item.

Ordinarily, producers extract honey as fast as the supers come off the hives, because the combs, being warm from the heat of the bees, extract easier and cleaner; but when one uses power to drive an extractor he can drive the reel so much more rapidly that he can surpass hand work. At all events, if one puts a bee-escape on a pile of supers at night, and it should be at all cool, the combs will be chilled before the next morning. It is an awful job to take the extracting-combs without a bee-escape, extract immediately, and put back the empty combs. The bees are smashed, and the operator, if it happens to be during the robbing season, must be armed with a bee-proof suit from head to foot, with trousers tucked in boots. There is more or less annoyance from colonies all stirred up, and at the end of the extracting the whole yard will be in an uproar. If the extracting is done during a heavy honey-flow there will be no robbers, but the work of the colonies will be more or less interrupted.

This plan requires fewer combs; for one who extracts after the honey-flow, at his leisure, must have a large supply of combs as well as storage room for them after the season is over.

Mr. Fowls has made quite a success of bee-keeping if we may judge by external evidence. He is what we might call a bee-keeping specialist, for he has no other business. Twenty-five years ago, when he began to keep bees, he bought a modest home on the outskirts of Oberlin, a college town, and lived in the old building until he accumulated enough money to build himself a fine house. It is a modern structure with hardwood finish inside, and well appointed in every detail. He has given his two girls a college education, and they in the mean time have worked with their father during their summer vacations. The son is only eighteen, but appears to be well able to hold up his end of the job in extracting. All together, we felt that Mr. Fowls, having accomplished what he has, should be congratulated. Any father ought to be proud of girls who are not afraid of work nor too nice to go out into the extracting-house and get themselves messed up with honey; and when it comes to uncapping, we venture to say they will hold their own with any two men we have ever seen.

One of them, before we realized what she was doing, picked up a can of honey, weighing not less than 60 lbs., and carried it from one building to another. We remonstrated, telling her that she ought not to do that. "Oh, my!" she remarked, smiling, "I am used to that." Her father told me he had protested time and again, but it did not do any good.

We hope to present soon a picture of Mr. Fowls and his interesting family. Any bee-keeper who can give his children a college education, build a fine home, and at the same time educate the general public to the value of honey as a food, for miles and miles around, is to be congratulated. Some time we hope to introduce this family more formally to our readers.

## GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

### FOUL BROOD IN IRELAND.

After much persistent hard work the bee-keepers of Ireland have succeeded in obtaining the passage of a foul-brood law by the British Parliament. This law would never have been enacted without the powerful backing of the Irish Department of Agriculture and the sympathetic interest of the Irish Nationalists in the House of Commons. Thus far the English bee-keepers have failed to secure such a law, though they certainly are in need of one as much as their Irish brethren! Hoorah for Ireland!

### DUAL QUEENS.

Among the delegates in attendance at the Franco-British conference of bee-keepers, none excited a livelier interest than Mr. F. R. Beuhne, President of the Victoria Apiarists' Association. In the discussion over Mr. Cowan's paper on the plural-queen system he was the only one present who could speak from practical experience on the value of more than one queen in a hive. He has practiced the dual plan for some years with success; that is to say, he has a young queen mated in a hive where there is a queen at least two years old. For a time mother and daughter get along well enough side by side; but after a while the old queen quietly disappears. He finds this an excellent method of rearing young queens and putting them to work "helping mamma" with her knitting until the latter ceases to exist.

### BEEES IN THE IMPERIAL VALLEY, CAL.

The bee-keepers of the Imperial Valley are of the opinion that there are sufficient bees now scattered over the valley to gather up all the honey available. In 1907 only 1000 cases of honey were produced from 700 colonies. During the summer and fall of that year, however, 5000 colonies were shipped in from elsewhere. This year the honey crop is estimated at 4000 cases, and this, in the opinion of experts, is all the valley can accommodate unless the alfalfa crop is largely increased. The alfalfa-bloom louse is a serious pest which curtails the yield of nectar very much. This is a microscopic insect which eats the alfalfa-bloom and consumes the nectar at the same operation.

Thus far the Imperial Valley has marketed its honey in El Paso, Texas, with satisfactory results. They ship there in carloads, where it is again shipped in small lots.

### PARCELS POST THIS FALL.

It will do no harm to ask your Congressman when he comes around this fall seeking for votes how he stands on the parcels-post question. Don't let him put you off with an evasive answer. You can inform him the postoffice has all the machinery necessary for the inauguration of this great improvement just as soon as it gets the signal from Congress. The mail-wagons go out every morning with plenty of room inside for packages. It

is the same with cars. Of course, something will be said about the retail country merchant being ruined; but the rule is now the greatest good to the greatest number. Both Bryan and Taft are known to favor parcels post; but there is no politics in this business in any event. The farmers are too slow as a rule in asking for what they desire and need. Whenever the "business" interests demand anything they very speedily get it from Congress. They organize, and push things until the Congressmen are compelled to give them every thing they want. Any way, almost all the bee-keepers would be helped by the establishment of parcels post, and would like to see it come into use.

### HAY-CAPS, AGAIN.

The following from *Hoard's Dairyman* bears on a very interesting question to bee-keepers. The use of caps for curing clover hay is one of the best agricultural improvements of recent years. It is particularly useful in curing alfalfa, as it allows the farmer to let his crop grow to full bloom before cutting it. In localities where the ranchers cut the crop before it is in bloom the bee-keepers can, with the greatest confidence, recommend hay-caps. The crop is cured without losing the leaves and other delicate parts. This is the essential point.

In the *Dairyman* of the 7th is an editorial on curing alfalfa. As I wish next season to follow these directions, and I am in doubt about some points, please inform me first: What is the size of your hay-caps? I can not find any cotton cloth more than 36 inches wide, except double-width sheeting. Second, how long must the hay remain in the cock to go through the heating which you say it requires to cure properly, if weather is good? and should it be put up damp enough to change color in the curing process? Wasco, Ill. N. H. W.

You will find a very full discussion on making alfalfa hay in our two last numbers. The hay-caps are made from A sheeting, 40 inches wide, but 36-inch cloth will answer. The time the hay must remain under cover will depend on the weather. It may require anywhere from one to three days. When the hay strongly twisted shows no sap it is ready for the mow. If properly cured in the cock it will remain a fresh green in the mow, and will not heat or change color.

### GLUCOSE AS A FOOD.

A friend in Nebraska has sent us a clipping from *Green's Fruit Grower*, which praises glucose highly as a food. Of course he expects us to refute the statements made therein. Briefly the case is thus: *Natural* glucose is a very fine food (honey is a natural glucose). It is found also in fruits, but in combination with something else. It is true, certain scientific chemists have praised artificial glucose, among them Dr. Wiley. He has changed his opinion, however, and so have others. Artificial glucose is made by the action of sulphuric, hydrochloric, or muriatic acid on starch. The action is far from being complete, and traces of these powerful acids are found in the glucose. Small as the quantities are, they are dangerous, as was amply proven by the Manchester case. Our glucose always contains chlorides. Students of digestion are agreed that these should not be there, even in very small amounts. It is true that glucose is used in making cheap or inferior preserves. For first-class goods, cane sugar is used. Let California preserve-makers use glucose and it will be only a question of time when their industry will be ruined. The ordinary "corn syrup" of the groceries contains about one-third part of cane syr-

up, which makes the glucose eatable, otherwise it would not sell at all. It would be better for the public if it were all cane syrup; and it ought to be remembered that the United States can produce vast quantities of cane syrup at a price not appreciably greater than that now paid for glucose. Dr. Wiley was hopeful of creating just such an industry, built up on honesty and fair dealing. Several large plants have been started lately in Louisiana to make a good syrup; but more would have been started had Dr. Wiley been allowed to have his own way in the glucose controversy. There is this to be said, however: The American people are rapidly becoming educated on the food question, and are more particular by far about their eating than they once were. The more particular they are, the better it will be for honey-producers.

#### LAND FOR SETTLERS.

THE following accounts relate entirely to lands lying under an irrigating canal constructed by the United States government acting for the settlers. Further particulars can be obtained only from the Secretary of the Interior, Washington.

In connection with the Sacramento Valley irrigation project in California, 265,000 acres will be subject to selection and filing on and after Sept. 3, 1908. The lands lie in townships 12 to 15 north, ranges 6 to 10 west, Mount Diablo principal meridian.

At the Carlsbad, N. M., irrigating project, 106,000 acres will soon be subject to settlement and entry.

Nearly 59,000 acres will soon be open for settlement at Big Bend, Washington.

At the Sun River irrigation project in Montana, 45,000 acres will shortly be opened for homestead entry only.

Dates will soon be fixed for the opening to settlement of 128,000 acres of irrigation lands in connection with the Minidoka project in Idaho.

On and after Sept. 10, 1908, there will be open for settlement 12,000 acres on the Payette-Boise project in Idaho.

The Secretary of the Interior will shortly declare open for settlement 300,000 acres on the Lower Yellowstone project in Montana.

It may be added that the government has approximately 3000 farms elsewhere which it will give away on certain conditions. These are all on irrigation projects. As a rule, these homesteads are superior to those given away some years ago in the prairie States; and to men who understand their business they offer excellent opportunities. All of them are likely to be in the heart of a good bee-range.

#### THE LORE OF THE HONEY-BEE.

Mr. Tichner Edwardes, author of "The Bee-master of Warrilow," has again appealed to the reading public of the English-speaking race with a new book bearing the above title. Without having seen it I can not express an opinion as to its merits or demerits; but Methuen & Co., the publishers, state that it is "a history of bees and their masters from the earliest times down to the present. The wonderful communal life within the hive is touched on in all its varying aspects, and the reader is introduced to a class of men

from all ages, as quaintly original as their calling is inimitably picturesque. The book covers the whole field of ascertained facts in the natural history of the bee, as well as the romance of beemanship, past and present; and nothing better could be put in the hands of the beginner in apiculture, as well as those of the advanced student of what is probably the oldest human occupation under the sun."

## NOTES FROM CANADA

By R. F. HOLTERMANN.

Messrs. John Newton, Thamesford, Ont.; D. Chalmers, Musselburg, Ont., and Homer Burk, Highland Creek, Ont., have been appointed inspectors in Ontario in addition to the list recently given in GLEANINGS.

#### THE EFFECT OF STORES IN THE HIVE UPON THE ENERGY OF THE BEES.

Perhaps it is not going too far to assert that, if the bees have not much stores in the hive, they are less active in gathering honey (I certainly believe they are less inclined to rear brood); but it is a new thought to me that the amount of stores in the hive would have any influence on the honey-gathering disposition of the bees. According to that, the disposition of a colony to gather honey would be reduced to a minimum.

#### BUCKWHEAT-GROWING.

On p. 958 Mr. W. K. Morrison says, "Probably few bee-keepers are aware that there has been a serious decline in the production of buckwheat as a farm crop in America." This statement is followed by facts and figures. Probably that is why the prices obtained in Canada for buckwheat are so much higher in recent years, and it may be for this reason that the acreage in Ontario, at least, is on the increase. German buyers are anxious to buy buckwheat grain in Canada.

#### SHADE FOR BEES.

In Stray Straws for Aug. 1, Dr. Miller writes, "When I look back I see the very best results from bees under apple-tree shade." That is certainly my experience. I like to have trees in an orchard. I like to have the bees shaded during the heat of the day, and I believe such shade has a cooling effect, even beyond the actual area of shade. Of course, I prefer a tree which breaks into leaf late in the spring, and I want light enough under the trees to produce healthy vegetation.

#### VENTILATION TO REPRESS SWARMING.

The question of ventilation in the supers by other means than at the entrance of the hive has been discussed. I have a  $\frac{1}{4}$ -inch by 5-inch opening for ventilation in three-fourths of my extracting-supers, which can be closed by means of a slide. I find the ventilation given in this way is a great comfort to the bees during hot weather. During the time the bees are gathering surplus honey there is no great difficulty in keeping

up the temperature of a normal colony. I feel quite sure, backed up by examination, that the bees are sometimes driven out of portions of the hive and compelled to remain idle, owing to excessive heat or lack of ventilation in the hive. Shade and a *large* entrance have, of course, an effect similar to the super ventilation. However, I like to be able to use all in combination.

#### PRICES OF HONEY.

The "Honey Committee" has again done good work in recommending prices for honey. There is no doubt that the work of this committee is the most valuable apicultural work that has been done in Canada for years. Prices, after allowing for wholesale, retail, and jobbers' profits, the quantity sold, the distance from market, and the cost of the package which contains the honey, are something like uniform. Such results must, in the long run, be an advantage to buyer and seller alike. May the good work spread to the United States.

#### PREVENTING THE SPREAD OF FOUL BROOD.

Recently I saw James Armstrong at work—one of Ontario's foul-brood inspectors. He appeared to have a plentiful supply of toothpicks, and I suppose that, to obviate the possibility of carrying infection from cell to cell, he appeared to discard these very freely. Some time later I had dinner at the same hotel that Mr. Armstrong was patronizing, and upon leaving the office I saw him help himself to a very liberal supply of toothpicks—rather more, in fact, than I thought necessary for a mouth with an ordinary set of teeth. Upon reflection light dawned upon me, and I could see wisdom displayed in combination with economy.

#### COMB FOUNDATION IN SPLIT SECTIONS.

This year I have seen some results from putting a long strip of foundation into four sections split on three sides to receive it, the sections thus having no passageways between the wax and the wood unless the bees gnawed through the foundation. There is no doubt that such a section will ship well, because the comb is thoroughly attached on all four sides; but it seems to me that the bees are noticeably more likely to work on one side of a section independently of the other. This results in a considerable percentage of sections with one side built out and capped while the other side is left entirely untouched. There are, therefore, more cull sections under certain conditions; yet I am pleased in general with this way of putting foundation in sections.

#### THE SELECTION OF LARVÆ BY QUEENLESS COLONIES.

It is now about ten years since Dr. Miller and I at the National convention in Chicago mildly crossed swords on the question of the bees, when queenless, selecting larvæ for the purpose of raising another queen. I thought I had observed that queens reared under such conditions sometimes hatched prematurely and were much inferior. In GLEANINGS for July 15 Dr. Miller puts the question very fairly; and the evidence he brings forward to the effect that the bees do not select larvæ too old to develop good queens is

very strong. Would it not be well to carry the experiment at Washington a little further, and give the time of hatching, and, as far as it can be judged, the merits of the early-hatched queens as compared with those hatched later, if there should be any material difference? Dr. Miller states rightly that the question is one of importance. I may be mistaken in my decision; and with the variety of work I have had to perform I may have come to a wrong conclusion.

#### DOES BUCKWHEAT YIELD NECTAR DURING THE CLOVER SEASON?

On page 236 of the *American Bee Journal*, Mr. J. L. Byers says: "Speaking of buckwheat, I am at a loss to know if the plant yields no honey early in the season, or whether the bees will not work on it when clover is in blossom. A large amount of buckwheat came up among the oats and other grain. One field of ten acres was literally white with the blossoms during the time clover was in blossom; yet, although we had a few mornings that one would think ideal for the buckwheat to secrete nectar, scarcely a bee could be found upon the blossoms." I have had some experience in a buckwheat and clover section, and I have had the experience of other bee-keepers similarly situated. We have often found that the bees worked on buckwheat during the clover season. In my estimation an ideal buckwheat morning would be an ideal clover morning. It seems to me that, when clover does not yield well, buckwheat may; or if clover is not very abundant the bees will work on buckwheat. I have also found Italian and Carniolan bees less likely to work on buckwheat when they can obtain white honey. This latter has been my experience again and again.

## GLEANINGS FROM THE PACIFIC COAST

By PROF. A. J. COOK.

#### SOME HONEY IN CALIFORNIA.

While the cool delightful spring was unfavorable to honey production in most parts of our State, yet in some of the inland canyons there has been a good honey crop. In one section near Santa Ana, the product has been measured by the carload. Could we have had in May and June the warmth that has come to us in July we should have had a tremendous production. It all depends on the weather. Warmth, no less than water, is imperatively needed.

#### PROPHECY FULFILLED.

This year has been very cool in most parts of our State. This has been so universal that in most parts of the State there will be a very light crop. In some interior valleys where warmth has prevailed, there has been harvested a fine crop.

In the Imperial country, as I learn, they have harvested honey by the carload, though the region is very new agriculturally and also apiculturally. I feel sure that these hot interior irri-

gated regions of our great West will prove banners for the bee-keeper.

#### BEE EARLY RISERS.

I have always been a very early riser, and at the present time I am often at work in my yard before it is light, that I may avoid the heat of the day, as the past month has been unusually warm in all Southern California. The house of my next neighbor, Mrs. Kinney, a short distance from my own, has had for years a flourishing colony of bees that go in and out close beside the great chimney on the south of the house. Every morning, before daylight, the bees are out in force, and one would almost think that a swarm was issuing. They are active all the day, but at no time are they anywhere nearly as busy as at this early morning hour. I am glad that the bees have learned the joy of outdoor life in the early hours of the morning before the sun has come with his blistering heat.

#### FERMENTATION OF HONEY; A NEW TROUBLE.

To-day comes a letter from Mr. Henry Perkins, of Calexico, a place to the very south end of the great Imperial Valley, which is burdened with a new complaint. He writes: "Can you give me a remedy for honey souring in the hive? This condition has developed in quite a number of the colonies in the past week. It begins with a few small air-bubbles in the cells, which increase in size and number until the cells are full, and a perceptible movement is obvious. This honey is very thin and sour, and the bees cease gathering and die off very rapidly. I notice that all honey is very thin, and ripens very slowly. The weather is exceptionally humid." Mr. Perkins wonders if the bees might not be fed syrup that contained some anti-ferment, in the open, and thus the fermentation be stayed. He naturally desires some speedy advice.

Since the researches of the great Pasteur, of France, we are entirely familiar with the cause and natural history of fermentation. All sugars, if very dilute when in solution, are the best pasturage for micro-organisms, and these bacteria are ever ready to take possession of such syrups. Vinegar is a result of just such action. Our unripe honey illustrates the same truth when it sours, as it is likely to do, in the presence of these ferment germs. The spores of these minute vegetable germs are always in the air; and if the weather is warm and close, then these germs thrive vigorously, and souring is always to be looked for. In the action of these germs, not only is acetic acid produced, but, as surely, carbon-dioxide gas. Barrels of unripe honey are likely to burst from this cause, as I once witnessed in the warehouse of our old friend Newman while I was visiting Chicago.

Heat, humidity, and thin nectar are then the sure requisites of fermentation; and the fact of these conditions explains all, in the present instance, in Mr. Perkins' apiary.

#### AND YET A PUZZLE.

The strange thing is, why does not the heat of the hive ripen the honey, and thus make it no fit place for the bacteria? Can it be possible that the depressed basin, below the level of the sea, to-

gether with the inordinate humidity, prevents evaporation, and so the honey fails to ripen, and fermentation is the result? If this is the case we may hope that the humidity will be of short duration; and with the return of the usually dry atmosphere the honey will ripen, and the sour honey will be no more. Of course, such honey is not good food, and we can not wonder that the bees die. Would it not be wise to extract this honey as soon as noticed, and ripen it artificially, and so save the bees? This can be determined only by experiment. By using great care it could be heated enough to kill all the germs, and it might be safe to feed it back to the bees after fermentation has ceased. Surely here is a good chance for Mr. Perkins to try some research work on his own hook, which may be of use to him and his neighbor bee-keepers. I do not believe it would be possible to correct this by feeding medicated syrup. It would be nice work to gauge the germicide so as to cure and not kill.

I hope that we may hear from Dr. Phillips, Mr. Dadant, and others in this matter. Has it been experienced before in other sections and in other apiaries? how long did it continue? was there any cure discovered? Surely these are timely and pertinent questions.

#### THE IMPERIAL VALLEY FOR BEE-KEEPERS.

It will be remembered that I have spoken in praise of the regions of Imperial and Coachella for apiculture. These are in the depressed valley where the great Salton Sea now holds the fort, and will till it all evaporates, which will take some years. I think this region very favorable for bee-keepers, as there are many of the best of our honey-plants grown in increasingly large quantities, such as alfalfa, melons, asparagus, and fruits of all kinds. Again, this region would be an arid desert, as it was only a few years ago, except for water and irrigation, and so the abundant water from the Colorado for Imperial Valley, and from artesian wells in the Coachella Valley, must always be used, and so there will always be the vigorous vegetation which is a *sine qua non* for nectar secretion. Again, the weather is always warm and almost always dry—that is, the moisture content of the air is very slight, and so the flowers will not hold back the nectar as they are wont to do in the cool seasons that come to all parts of our country. So, like parts of Colorado, Arizona, Utah, Nevada, and the San Joaquin Valley, of our own State, we may expect a certain honey production, or more certain than in any other part of the world where these conditions do not prevail.

WE are glad to be able to announce that there is likely to be a State organization of bee-keepers in Mississippi. Mr. H. E. Blakeslee, Commissioner of the Department of Agriculture and Commerce, Jackson, Miss., is making an effort to get the names and addresses of all the bee-keepers in that State, of which he has at the present time about a thousand. A meeting will be held in Jackson at 10 A.M. on Monday, Nov. 2, for the purpose of perfecting the organization.

## CONVERSATIONS WITH DOOLITTLE

### WINTER PREPARATIONS.

"I was told the other day that you believe that September is the month in which to prepare bees for winter, if the best results are to be secured the next season. This was something quite new to me, so I have come to have a talk with you. It is so different from what I have been practicing that I had my doubts in regard to it."

"Well, Mr. Grant, I believe that the most of our bee-keepers wait until it is too late in making any needed preparations for winter. Wintering is one of the great problems in the northern portions of the United States; but there are some things regarding the wintering of bees which are applicable to all portions of North America, if not to the whole world."

"But you would not recommend such a thing as cellar wintering, as you practice it, to our friends in the South, would you?"

"No. In fact, this early preparation we are to talk about will have very little to do with where the bees are to be wintered, but, rather, about the preparation of the colonies. One of the old veteran bee-keepers of the time when I first started in apiculture said, in a convention which I attended, that the time to begin preparations for the honey-flow is the season before. Now, we shall have to modify this but little to have it apply to the preparation of colonies for wintering, for, surely, such preparations place the bees in the best possible condition to be in readiness for the flow of nectar when it comes the next season. All of the old stereotyped advice of the past has had to do with the wintering problem along the line of whether the hives should be packed or unpacked; whether the bees should have ventilation at the top or the bottom of their hives; whether there should be much moisture in the cellar or great dryness; whether the cellar should have sub-earth ventilation or ventilation by means of a tall chimney; whether the colonies have sufficient honey, or stores of sugar syrup with no pollen, etc. But little stress is laid upon other conditions such as age of the bees, the age of queens and their general good qualities, the proper spacing of the combs, etc. Sufficient stores, also, should be included as one of the necessary preparations to be made at this time of the year."

"Then you think that September is the time to do these things?"

"Yes, or earlier. As a rule, wintering preparations are deferred until late in the fall, when it is too late to cure any defects that may be discovered in the general condition of the colony, except, perhaps, the giving of stores where colonies are found wanting. I believe it to be a fact that, if a colony is provided with a vigorous queen, plenty of bees of suitable ages, and ample stores within easy reach, the other so-called essentials may be in a measure disregarded in almost any locality except where winter holds supreme for five or six months without giving the bees one single chance of flight."

"When should this preparatory work begin?"

"You can not set any day of the year, but it

should begin immediately after the close of the honey harvest, and continued, if necessary, and, whenever the weather is favorable, well into the first week or two in October. I would first require, with the best stock in the apiary, all colonies whose work had shown during the season that their queen was not of the very best order; and I would not allow prolificness in the production of bees to be the only essential to go by either. Together with prolificness and great honey-gathering qualities should go perfect comb-building in the sections, white capping of the combs, little inclination to build brace-comb from the surface of the combs in the sections to the separators, and the bees should not daub everything over with propolis."

"Do you expect to get a bee perfect in all of these respects?"

"It may not be possible to reach perfection in all of these things; but unless we set our ideal high we shall be drifting toward a lower level all the while. I know that, with such high ideals before us, very many of our best queen-breeders have bees to-day which would have been called *perfect* by those of half a century ago; and if we improve in proportion for the next half-century, those who are on the stage of action at that time will have bees which we would now pronounce perfect. Occasionally there will be a colony headed by a queen whose bees are inclined to store the larger part of the honey in the brood-combs, or, in other words, they will gorge the brood-nest with honey, so that late in the season there is little room available to raise young bees. The old bees soon die off, and spring finds the colony heavy with honey, but so reduced in bees that half of the harvest is past before the colony can be gotten into shape to work in the sections. This condition can be remedied now with but little work—first by changing the queen for one of the young ones from the best stock; and, second, by removing two or three of the frames of solid honey and inserting in their places frames of empty worker comb. A little of the honey at the lower side of the remaining frames should be uncapped to give the queen a chance, which she will not be slow to improve, as she is young and vigorous. If this is done the last of August or the very first of September, two sets of bees will be reared and a suitable force provided whose period of life will be extended far into the spring. I have known such bees to live and do good work well into the latter part of June, and always until the colony becomes strong enough to take advantage of the flow of nectar from white clover. All colonies deficient in stores should be fed, rather than wait till so late that they will not properly surround the brood or clustering-nest with well-ripened food. If done thus early in the season, the feeding will not only provide the necessary stores for winter, but stimulate, to the rearing of a little extra brood, the bees from which will help to carry the colony into the next spring in perfect order."

"But all of this will require a lot of work?"

"Not so much as you think, for the little attention at this time to these details will lay the foundation for a good crop the following season, and is really work which pays fully as well as if not better than any thing else which we do throughout the whole year."

# GENERAL CORRESPONDENCE

## CLEANING COMB HONEY.

**How to Make a Table for the Purpose, and How to Avoid Scattering Bee-glue where it does Not Belong; Plain Sections Best for Scraping.**

BY J. E. CRANE.

I said to my helper a few days ago that I was expecting to write an article for GLEANINGS on cleaning comb honey. "Well," said he, "there ain't nothing to do in cleaning honey but just to scrape off the propolis. That is all there is to it."

It seemed a good deal so to me; but when I remembered the slow sticky job of years ago, and the cleaner and more rapid way we now do it, it looked as though there might be something said that would be of *some* value, at least to beginners.

First, we want a suitable bench or table. The one described in the A B C and X Y Z of Bee Culture seems sadly defective, as it makes the operator stand on his feet, which alone would tire me without doing much work. A table that one can sit down at seems to me more desirable.

One of the best I have ever seen was described in GLEANINGS, I think, by Mr. P. H. Elwood, of Starkville, N. Y., a few years ago. I made one somewhat after his description, and it is about as follows:

Make a table of planed boards, 3½ ft. long by 2½ wide, with legs short enough so that, when you sit in a chair, the top of the table will come just above your knees. Around the top, nail a four-inch board for a rim which will extend three inches above the upper surface of the table. Two strips, one inch by ¾ inch, and the length of the table, are to be nailed six inches each side of the middle of the table. Now get two aprons of denim or other strong cloth, made so one end can slip over your neck, like the leather apron of a blacksmith, with the lower ends tacked to the end of the table. Now place a super of sections on the two cleats which support it one inch above the table, and with the apron over your neck, a sharp knife, and your sleeves rolled up, you are ready for business.

The apron and table catch nearly all the propolis, and the cleats hold the super out of the way. It is not necessary to rest the section on the table, but hold it in one hand and your knife in the other, and then you can make the propolis fly. I like a good heavy jack-knife for this work, and it should be of the best steel, and kept sharp to do the best work. The propolis scrapes off better in cool weather than when it is hot, and after the sections have been off the hives a few weeks than when first taken off; but as we can not always wait we find that a little dish of water on the table, to dip our knife into frequently, will help much in keeping the propolis from sticking to it.

Before sitting to the table to work I take five supers, and with an old steel caseknife I scrape the top of the sections clean, and then scrape the bot-

tom of the super free of wax and propolis; and as the sections are cleaned they are placed in clean supers. After the sections are removed from a super the entire super is cleaned of propolis. I have seen sections cleaned and then returned to a super to be again stuck up before using. Some weigh and pack the honey as cleaned; but I prefer to put the sections back in supers by themselves and the separators in other supers by themselves.

### GRADING AS WE CLEAN.

If we can, it is well to sort as we clean, placing the best grade alone in the same supers, seconds by themselves, and the very light ones in supers to go to the extractor. Another grade should be made if necessary.

All combs containing cells of pollen, not covered by honey, or containing cells of brood, should be put in a super or supers by themselves, as worms, or the larvæ of the wax-moth, are almost sure to develop in them and ruin them unless watched; and when a few sections have worms just beginning on them, place in a stone crock and on top of them a dish into which pour a teaspoonful of carbon bisulphide and cover tight for twelve hours, after which they may be set aside with safety until you get ready to dispose of them as you think best.

### THE WORK OF DIFFERENT COLONIES IN THE SUPERS.

In cleaning ten or twenty thousand sections we are sure to find some imperfect ones, and others that have brace-combs so attached as to make them surely leak when detached from separators, and there are many others that have been set to dripping by careless handling. For these I have two tin traps or pans, 18×24 inches, and 1½ inches deep, set on a table. Over these I stretch galvanized wire screen on which I place any sections that drip, until they have run dry, when they may be cleaned of honey and used or sent to the extractor.

One of the most difficult things in cleaning honey is to keep propolis in its place. With some help it will get all over the floor and over your honey-house, out on the walk, into the kitchen of your house, and even into your parlor, and you wonder where it all came from. Even with the greatest care it will be well, when you hear the dinner-bell, to scrape your feet carefully or change your shoes, or the good wife may meet you with a frown instead of a smile.

Heavy paper laid on the floor before beginning to clean honey is a great help in cleaning up when through, for you have only to take up the papers and burn them, and your floor is about as clean as when you began.

At its best, cleaning sections is apt to be somewhat monotonous. It is better to work at it by the job rather than by the day. A watch on the table beside or in front of you is sometimes helpful; and if you can clean 120 an hour you can at least clean 1000 a day; and if you have only 12,000 to clean you know that two good hands should go through it in a week.

There is a way by which the monotony of cleaning honey may be largely done away with providing the honey is of your own production and from your own bees, and you do all the work yourself. Just mark on each super as you take it off, the number of the hive, and whether it is

first, second, or third super. Then as you clean each you know just where it came from. Keep a record of your hives near you also for reference if desired.

Now notice the constant variation in the combs built by different colonies. Here is one where the combs are of snowy whiteness, almost every one filled perfectly, so you will prize very highly the colony that produced it; and, if possessed of other good qualities, it may be just such a one as you may wish to rear queens from next spring.

The very next super may be filled with combs with more or less pollen in them. What is the cause of this? Were the bees queenless while filling the super, or was it because of a slovenly way of scattering pollen through their hive? A glance at the record will show. If they had a queen she should be blacklisted. Here is another with various irregularities, with some of the combs twisted and attached to separators and plenty of brace-comb.

We soon find another with thin lean combs, some of them hardly finished, but, oh my! how every section and separator is stuck up with propolis! It takes twice as long to clean such sections, and, when finished, they do not look well. Evidently the bees of the colony that produced it were not lazy, but their industry was misdirected. Better place the queen of that colony on the black list to be removed at the earliest opportunity. After finding half a dozen supers fairly satisfactory we find one with more or less brood in the central combs. Why is it there? Was the brood-chamber crowded with honey or was it owing to a lack of honey when the combs were built, or an unusually prolific queen?

Here is another style of sections we are pretty sure to come across. They are well filled, well capped over, but those cappings are badly stained or discolored with dark wax or propolis, or what not. Shall we place the queen of such a colony on the black list too, whose workers do not do just such work as pleases us? It grieves me that we must visit the misdeeds of the children on the innocent queen mothers. Well, we need not blacklist the queen whose workers stain their combs badly, for I have found a way by which it can be largely prevented.

We may think of a large pile of supers of honey to be cleaned, not as a great job of disagreeable sticky work, but, if properly numbered, as a great volume, each super a page, giving us the history and character of each colony so far as it relates to storing surplus honey. To me the opening of this volume, and reading it page by page, is a great source of pleasure as well as instruction. I am usually glad, though, when I am through.

I have said nothing about a cleaning-machine, as I know little that can be said for them. I find I can clean from 100 to 120 per hour, although the weather has been intensely hot, and the sections just removed from the hives, and I doubt if a machine could do more.

I believe the use of plain sections, perhaps, simplifies and helps the rapid cleaning of sections more than any other one thing; and if there was nothing else to be said in their favor this alone should be sufficient to make them popular.

Middlebury, Vt.

[We understand from the description that the

super is placed in the middle of the table while an operator sits at either end. Some prefer to stand up a part of the time at least; and if the table were made just right for standing, chairs could still be used if extensions were nailed on the legs.

Mr. Crane does not say just how he uses the scraping-knife. We infer that he makes a sort of sweeping motion toward the table, causing the particles of propolis to fly in that direction.

We suggest that our correspondent have some nice photographs showing the table, the operators at work, and the manner of holding the section in one hand, and the use of the knife in the other.

We would hold this article for the photos, but the subject matter is so seasonable that we have thought best to publish it at once and the photos afterward.—ED.]

## MILKWEED AS A HONEY-YIELDER.

### Is the Plant Detrimental to the Bees?

[The following note was received by Professor Surface, who, thinking that it might be of interest to our readers, sent it on to GLEANINGS, together with his answer.—ED.]

*Prof. H. A. Surface—dear Sir:*—Watch closely the honey from milkweed. Last year it yielded a good crop of honey. Locality may make some difference, but it is valuable here as a honey-plant.

L. B. WHITNEY.

Covington, Pa., June 24.

[Replying to the above, Prof. Surface says:]

*Mr. L. B. Whitney—dear Sir:*—I appreciate your communication upon this subject, and would call your attention to the fact that milkweed is very objectionable as a honey-producing plant for the reason that the pollen-bearing blooms of the plant pull off and stick to the legs of the bees and disable them, and cause the others in the hives to throw them out, and they are thus killed in great numbers. If you will look closely at bees that have been getting honey from milkweed you will find little yellow appendages on their legs. These are parts of the flower known as anthers, or pollen-sacks; and as they stick so closely as to disable the bees they eventually cause the death of the honey-gatherer. Thus the value of milkweed as a honey-producer is to be more than questioned, and I would recommend mowing it down as a matter of preservation of the bees. Whether all species of milkweed have the power of injuring bees by the pollen-sacks adhering to the legs or not, I do not know; but it is true of the low kind with pink flowers which especially grows in swamps.

H. A. SURFACE,  
*Economic Zoologist.*

Harrisburg, Pa., June 26, 1908.

[At the convention of the Northern Michigan Bee-keepers' Association, held last April, one of the members mentioned having secured a fine crop of honey from the milkweed. He reported the flavor as being pretty strong at first, but it became milder until it was but little stronger than white-clover honey. The color was so light that he received 1½ cents more per pound for it.—ED.]

## THE TROUBLES OF AN AMATEUR BEE-KEEPER.

### A Fresh Start with Bees.

BY F. DUNDAS TODD.

The middle of August found me in Southern Oregon; and before I had moved into my new home I had bought a "stand" of bees—not a hive, but simply a box made out of 12-inch lumber about 14 inches high. I ought to have photographed it as I first saw it standing on a huge drygoods-box and surmounted with a double-tier section-super that overlapped it everywhere. Bees were flying out and in of all sides of the box, as these had conveniently cracked from top to bottom. Examination showed a hole an inch in diameter at the top of the hive, and through this the owner expected the bees to enter the super and lay up a store of sweetness for him. Because they would not, and as he was going to move, he would sell for a dollar, and I handed him the money.

Now, I ought to be able to tell how simply and perfectly I transferred that box hive to my own yard; but instead I must confess I acted like the veriest greenhorn, and made a mess of it that was humiliating. The trouble was, I had no stand, so I wanted the drygoods-box too. So one night I took four fair-sized nails, a hammer, some mosquito-netting, and a wheelbarrow, and started to fetch that box hive. With the netting I wrapped the hive as it stood, covering all the

AN ORCHARD SCENE IN SOUTHERN OREGON.

Note the bee-hives under the trees.

entrances and exits, then proceeded to toenail the hive to the box. Then my boy and I lifted the drygoods-box and hive on to the barrow. Grasping the handles of the latter I started for home; but before I had moved a foot the wheel struck a snag; the nails gave way, and that confounded box hive turned several somersaults over the wheel. The bees may have been startled. I certainly was. A hasty examination with the lantern showed the hive on the ground upside down, with thousands of bees running all over it. Prompt action seemed a necessity, so I dumped the drygoods-box on the ground, grabbed the hive, landed it right side up on its old stand, and then skipped to a certainly safe distance. I carried a few troubles away in my fingers, just as souvenirs of the occasion.

Next night I acted sensibly. I spread a large

square of two-fold mosquito-netting on the big box, lifted the hive into the center of it, gathered the slack up round the sides and tied safely with a string. Now I could handle the box of tricks without anxiety. The engraving shows what it looked like in my own yard. I felt I would have no troubles over this hive until spring, as bees in this valley get no winter protection whatever.

However, trouble followed me on the old schedule, but with a new variation—it always does act that

THE TODD APIARY, MEDFORD, OREGON, AS IT WAS IN OCTOBER, 1907.

way. One day I saw a worm of some kind lying in front of the entrance, and I wondered what it was. Once more to the books, and I began to suspect the beeswax moth. Enquiry soon let me know that this insect was exceedingly prevalent in this region; in fact, it seemed to have headquarters here. What was to be done about it? I decided to transfer to a frame hive, but I did not have one beside me; so, having lots of leisure on my hands, I proceeded to make up a couple in a crude way according to the style used by Mr. Hand, in whose articles I had become intensely interested, and made the transfer Nov. 6. Rather late, you will say; but let me assure you the sun was shining brightly, and the thermometer registered 65 degrees in the shade. At date of writing, a month later, the bees seem to be all right, so I have no real material troubles on hand just at present that I know of; but I am struggling

the doctor, but all the same I will Italianize in the spring, because, if they develop the demonical traits that are characteristic of those in Marengo I should never be able to attain the sunny countenance for which the oldest, yet youngest, bee-keeper in America is famous. And since there will be no female restraining influence in my bee-yard my language might become more picturesque than it is now when my sweet pets get their innings, and score both hits and bases.

Last night I dreamed a wondrous dream. Somewhere I was traveling in a train, and I got into conversation with the conductor. Our subject was bees. He told me the only place in Oregon to keep bees was near Mt. Hood, and that he had one hive there that gave him 4000 pounds of honey each season. I felt sorry I ever woke up. Wouldn't you, too?

Medford, Oregon.

A NEW SHIPPING-CASE WITH SLIDING COVER AND CUSHION PAPER TO PREVENT THE BREAKING OF SECTIONS.

very bravely with other men's ideas and the conditions in this valley so as to head off trouble in the spring, when I purpose endeavoring to smash all records for building up increase. Of course, I shall probably fail, but will have lots of fun trying.

I wish somebody would tell me the kind of bees I have. They are not Italians, and I don't think they are Germans. Imagine an interval of 30 minutes to have passed since I wrote the last sentence. I have just returned from visiting a couple of my neighbors' yards, where I have inspected the color of the bees. I found one hive where the bees were very black, but most others very closely resembled mine. Just fancy I am, as a bee-keeper, in the same class as Dr. Miller, for my apiary is stocked with hybrid bees. Of course, he has about 300 hives while I have only about half of one; but in my early youth I was taught that the size of the offense did not count so very much—it was the quality.

My bees seem to be more gentle than those of

## A NEW STYLE OF SLIDING-COVER SHIPPING-CASE.

BY E. R. ROOT.

Every now and then there has been a call for a shipping-case with a sliding cover so that the case may be opened, a section or two taken out, and the case instantly closed. The trouble with the ordinary case with the nailed cover is that it is not easy to open for the purpose of inspection. When it is put on the counter to retail from, the nails must all be drawn and the cover laid on top. This has its objections, because the cover gets pushed aside, flies and ants get inside, the sections become soiled, and the public does not want them. To make a sliding cover in the ordinary way requires projections that will split off in shipping. It is important to have the covers so that the top surface of the case may be perfectly smooth, so that, when the cases are piled one

on top of another, there will be no danger of knocking off the projections.

The accompanying illustration is a form that has been suggested by some of our own men, and we believe it very nearly overcomes, if not quite, all the objections that might be made against a case of this kind. The sketch in the upper corner shows how the cover is held in place.

The question might arise, "Why not make the end pieces a little deeper, and grooved out at the top edge so that the whole end will be solid instead of nailing on extra cleats?" First it would increase the cost of the end boards, and, worse yet, there would be danger of splitting off at the grooves; and, second, if the cases were nailed up carelessly the cover might fit badly, and then it would stick. By having the beveled cleats made separate, and held in place by means of nails, we retain all the advantages of the old cover that was nailed on, and yet have a cover that will slide on and off easily. Even if the cover should stick the nails could be drawn as in the old style.

The new case should be nailed up as before, and the two holding cleats and the cover should be put in place. One of the cleats should then be nailed squarely in position. The cover should be pushed toward the nailed cleat, when the other one should be put in place. If it be not crowded too tightly against the cover there will be no sticking nor pinching; indeed, there can't be any.

It will be noted that corrugated or cushion paper has been substituted for the no-drip cleats. Experience shows that many bee-keepers are careless in placing these cleats. A large number don't know what they are for. Sometimes they put them *on top*, and sometimes they leave them out altogether.

The trade is working over more and more to this paper, for all experience shows that honey ships better on it. Its use is obvious, and it can not be put in wrong. It is the same paper that is used around bottles of medicine and all other fragile objects. If it is a good thing to protect glass, it goes without saying that it will prevent a great amount of breakage of combs in shipping-cases.

This kind of corrugated paper was suggested by Mr. J. E. Crane and others some two years ago, and since that time it has been coming more and more into use. Of course, corrugated paper would have to be used in the paper trays to hold any honey that might drip.

We have subjected a case having corrugated paper containing sections, and a case of the same lot of sections having no-drip cleats, to all kinds of rough-and-tumble bumping and dropping. The former stood the treatment much better than the latter. We believe the use of this cushion paper will save a lot of broken comb honey, some unsatisfactory adjustments with the railroad companies, and some bad feeling between the producer and the commission man.

We made up a number of these cases, and sent them out to commission men and honey-dealers in order to get their opinion of the case, and the following are some of their replies:

We are this day in receipt of your letter of the 14th inst. and sample honey-case, with stated contents. The entire package is very pleasing to the eye; and if the cover will work on all cases as on this sample it is certainly a most helpful device. One nail

half an inch in length would be quite sufficient to hold the cover in place on the smaller-sized case;  $\frac{3}{8}$  inch might be sufficient.

As to using the corrugated paper in place of the no-drip cleats, we do not care to give an opinion aside from the fact that it is worth trying. It would have the advantage of not shifting in the case, and any one could be trusted to insert it who could be trusted to do any thing about crating honey.

Chicago, Ill.

R. A. BURNETT & Co.

We consider this case far superior to the others, for the simple reason that it will take less time to open it up by simply pulling out the one nail and sliding the cover off, and the same may be said as to closing it again, instead of driving in six or eight nails. One stroke with the hammer will perfect the job here, therefore we think that, as you can furnish this crate at no higher cost than others now in use, bee-keepers should take hold of this and adopt it immediately.

In regard to corrugated paper for the bottom of the crates instead of no-drip cleats, I beg to say that quite a number of prominent bee-keepers have been using it right along. The no-drip cleats would work all right if they were nailed to the bottom of the crate. Most bee-keepers seem to forget this, simply laying them in loose, and then, while the honey is in transit, these narrow pieces of wood slip, and we have found them at times to be all at one end of the crate, thus causing some of the sections of the honey to break down. Even at a slight additional cost we should think the corrugated paper far superior to the no-drip cleats on account of less work, and also on account of not taking any risk of having the combs broken down.

New York, N. Y.

HILDRETH & SEGELKEN.

I like the slide part, but I object to corrugated boards, because, to my notion, there is an inconvenience when honey is broken. In packing you would either have to have corrugated boards or stumps. If you have no-drip cases, if nailed tight they can easily be washed out. I may be a little wrong, but this is my experience with corrugated boards.

C. H. W. WEBER.

Cincinnati, Ohio.

Yours is at hand in reference to new style of shipping-case. The case was received yesterday. We have looked it over, and think it will be received by grocerymen, and others retailing the honey, as an improvement. The sliding cover will be used to keep the honey covered up and away from flies and dust. The other cover would not be used this way as much, as it would be knocked or brushed off from the top, and no time would be taken to replace it.

Syracuse, N. Y.

F. A. SALISBURY.

Your letter along with sample of shipping-case is at hand. I am delighted to see the neat appearance, and heartily endorse the improvement of making the cover in one piece with a slide. I would also recommend, beyond question, the corrugated paper, as it is desirable in every way.

WM. A. SELSER.

Philadelphia, Pa., July 17.

Your circular letter in regard to the improved shipping-case is received; also the sample case. I would say that I have always been an advocate of corrugated paper for shipping-cases, instead of the no-drip sticks. They are more easily put in place, and, as you say, form a cushion for the sections to rest on. That is no small item. The cover is a step in the right direction—something to retail from, and have a cover that can be put on and taken off at each sale, so there will be "no flies on it."

Remus, Mich., July 21.

E. D. TOWNSEND.

The new shipping-case with sliding cover is at hand, and I have examined it very carefully. I am delighted with it, and I think it certainly will take well with the bee-men. As to the corrugated bottoms, I have felt that we were behind the times in not adopting it long ago. I have had honey arrive here in much better shape where the corrugated paper was used. My wishes would be, the sliding cover, corrugated bottoms, and then crate in smaller lots so they can be handled to better advantage; and if the cost increases, I am sure it will be met all right.

Indianapolis, Ind., July 15.

WALTER S. POWDER.

## BEE-KEEPING IN AUSTRALIA.

### An Interview with the President of the Victoria Apicultural Association.

*Continued from last issue.*

"We have read something about your pollen-famines in Australia; do we understand that your bees die for want of pollen at certain seasons?"

"Yes. Breeding, even in mid-summer, comes sometimes to a complete standstill, owing to a scarcity of pollen. We sometimes have periods in mid-summer when there will be nothing but

eggs in the brood-combs although there may be plenty of honey."

"Do we infer that these eggs do not mature into larvæ for want of pollen?"

"I am of the opinion that eggs are being continually laid to a limited extent, and the older ones being removed by the bees, instead of being supplied with larval food which they can not procure."

"Why do you not feed rye or bean meal, or some of the other artificial substitutes?"

"We have tried all the known substitutes on a large scale; and although we could get a great amount of brood, we could never get a good strong force of field bees, or at any rate no satisfactory yield of honey with bees reared with artificial food. The bees fell away, were short-lived, and consequently they were unable to gather much honey."

F. R. BEUHNE.

"Then you find, do you, that natural pollen furnishes you a stronger and longer-lived bee than any artificial substitute?"

"Yes. But some seasons even the natural pollen appears to be abnormal or deficient in protein; and the bees, in consequence, are short-lived. If this deficient or poor pollen is stored in autumn it means short-lived bees that are reared on it in the fall and in the spring, with the result that the whole colony dwindles to nothing, at a time when it ought to get stronger every day. On one occasion I lost 200 colonies out of 215 from this cause."

"It is possible that this may explain why we bee-keepers in America have severe cases of spring dwindling, even when weather conditions are apparently favorable. While we do not know that we have pollen-famines the same as you have, yet we probably have a scarcity of good pollen or a quantity of poor pollen. I suppose you are

prepared to substantiate every statement you have made above?"

"Yes, I am prepared to do so, with some reservations on scientific points. Your readers would be greatly interested in an address delivered by Dr. Thomas Cherry, who is an eminent bacteriologist, and at present Director of the Department of Agriculture of Victoria, Australia."

"How do you prove that the bees in the cases mentioned were short-lived?"

"I tested this point by exposing bees in large queen-cages to the night air, using six cages from a dwindling apiary, and six others from an apiary at a distance, which was in a normal condition."

"Have you ever had your pollen analyzed?"

"Yes; and I have with me reports of analyses of Australian pollen which I intend to submit to Dr. Phillips for comparison with the analyses of American samples."

#### THE TWO-QUEEN SYSTEM.

"Mr. Beuhne, have you ever tried raising brood from two queens in one colony?"

"I have."

"Can you keep two queens in a colony without the use of perforated zinc—one queen on either side of it?"

"Yes, I have done so for years."

"How do you do it?"

"I have no difficulty in keeping two queens in any one hive on the same combs provided that one of them is at least two years old."

"Suppose the other queen was also two years old."

"My experience proves that, after a queen has attained a certain age, beginning when about two and a half years old, she is not considered as a rival by any other queen introduced or raised in the hive."

"We may assume from this, then, that two queens can live peaceably in a hive, whether one or both are raised there or not, providing that one of them has arrived at or has nearly reached the supersedure age. Is that correct?"

"Yes, I believe so."

"Do I understand you, Mr. Beuhne, further, that, at the time mentioned, two queens may be used in a hive, provided both of them are properly introduced, and providing, also, that one of them is not less than two and a half years old?"

"Yes, I believe so, excepting during a honey-famine; and during the winter months the older one will disappear."

"Well, now, Mr. Beuhne, are there any conditions at any time when, in your judgment, it is an advantage to have more than one mother to a colony for the purpose of rearing brood?"

"I have experimented along this line ever since 1893, and have come to the conclusion that there is no practical gain in bees or honey by having two queens in a hive. Early in the spring, spare queens are rarely on hand; and even if such should be the case, a queen can usually lay more eggs at this time of the year than the workers can attend to—the trouble being, not the lack of eggs, but lack of worker forces to take care of them."

"Do you ever consider it an advantage to have a certain number of colonies supplied with two queens to supply certain colonies with only one

F. R. BEUHNE WATCHING THE FLIGHT OF BEES AT A HIVE IN THE HOME YARD IN MEDINA.

queen that may unexpectedly become queenless?"

"Yes. The two-queen system is very useful in such cases; but the principal use to which I put it, and which I consider very important, is the raising and mating of young queens in strong colonies with an old queen, the young laying queen being removed whenever required, and a queen-cell being inserted to repeat the operation; but a virgin should not be in such a hive till at least a week after the removal of the young laying queen. This is very important. The same method may be practiced in nuclei. An old queen continues to supply the eggs for brood while queen-raising is going on."

"We make that a practice in our queen-rearing operations every season. In fact, superseded colonies are at a premium with us for rearing a large number of fine cells, containing larvae from our breeder. A queen just beginning to fail is worth more to us for cell-building than any young vigorous one that can take care of the needs of a colony without a prospect of another coming on."

"Here too. There has been in my locality a demand for even three-year-old queens, several bee-keepers having obtained such from my apiary for the purpose of introducing them to strong colonies in which to raise queens under the superseding impulse, as in the other case a week

being allowed for the bees to become aware of the change in queens."

"How do you succeed, Mr. Beuhne, in getting early drones from a select breeder in sufficient numbers so that all young queens in the early spring will mate with these selected drones?"

"The only satisfactory way I know of is to introduce those queens, from which we desire to raise drones, to strong colonies of black bees during the winter, having supplied such colonies with the necessary drone comb in the right position in the hive. As black bees will breed earlier in the spring than Italians, we obtain our choice drones much earlier than would be possible with even stimulative feeding."

"We find that our Caucasians will breed a hundred drones to the Italians one. Whether the Caucasians would be the equal of the black bees we could not say; but we believe that your suggestion of putting choice Italian breeders into stocks of bees of strains that will rear more drones than Italians, and earlier than Italians, is a good one. Now, Mr. Beuhne, it has been observed by bee-keepers of both continents and both hemispheres, that, where Italians largely predominate through selection in breeding, if the bees are left to themselves, and if there is some black blood in the locality, all the bees in that locality will sooner or later degenerate back into hybrids

or blacks. Do you account for this by the tendency in the blacks to rear drones in larger numbers, and earlier?"

"Yes, I do. In addition, we must bear in mind that blacks are usually allowed their own sweet will in the way of building drone comb. There is also no check on the age of queens. Under these conditions, and the well-known fact that black bees can raise brood at a lower temperature, it is but natural that the race of bees in a given district should gravitate toward the black race. There is another thing in this connection; and that is, that the black bees (and that would include the drones), being less susceptible to cold, would be out in the air more than the yellow bees."

"I notice by the last issue of the *Australian Bee-keeper* (March 15) some illustrations showing the gearless honey-extractor that you are using at your yards—that is to say, you employ two pulleys and a round leather belt, the driving pulley being considerably larger than the driven ones. What advantage has this over the method of using such gears rather than a positive drive that can not slip?"

"I use the belt-driven gear owing to the liability of cog gear to fracture when driven at such a high rate of speed as is required to extract our thick honey, which, as you may know, runs 12 lbs. to the gallon. The slipping is reduced to a minimum by having the large pulley fixed in such a way that it may be lowered at any time to increase the tension of the belt. A little slipping at the beginning, when first started, I consider an advantage, as it will prevent the breaking of new combs. One great advantage of the belt gear is that it is almost noiseless."

"Do you use a flat or a round belt? and if the latter, what is the size of it?"

"I use a round belt  $\frac{3}{8}$  inch in diameter, such as is used for power-driven sewing-machines."

"How many colonies have you?"

"I have at present 300."

"How far apart are your yards?"

"Four miles and a half in a straight line."

"What are your main sources of honey?"

"Exclusively eucalypts, with the exception of a few plants and shrubs in early spring."

"How does honey from eucalyptus compare with American or European honey?"

"In color it varies to about the same extent. It is of a different flavor, but of a greater density; and I should think, therefore, it would be very useful for manufacturing purposes."

"Have you many unoccupied ranges in Australia not too remote from a market?"

"That is a matter of opinion. All the best bee territory within thirty or forty miles of a railway is pretty well stocked now, but there are immense tracts of native forest yet untouched on account of the distance from railroads."

"Can you estimate approximately the amount of honey that is annually produced in Australia?"

"For the State of Victoria, during the season of 1906 and '7 the number of hives of all kinds was 48,000; and the yield of honey was 3,000,000 lbs., besides 46,000 lbs. of wax. This makes an average of a little over 62 lbs. of honey to the hive."

"What would be your average, Mr. Beuhne, per colony, one year with another?"

"My own average for ten years is slightly over 100 lbs.; but mine is by no means one of the best districts."

## BOTTLING AND PREPARING HONEY FOR MARKET.

BY E. E. COVEYOU.

[The writer of this article, Mr. E. E. Coveyou, who produced 25,000 lbs. of honey this year, is one of the most extensive bottlers of honey in the United States. He has every thing worked down to a fine system to save labor. He has built up a large trade and a big business. His scheme of "rolling" the labels on the bottles and tumblers without touching them is quite unique. The whole article, in fact, is deserving of a careful reading, for he seems to be full of the "tricks of the trade." The best part of it, he is willing to give them to the public.—ED.]

We have always bottled our entire crop, and bought considerable each season. We also make our hives and shipping-cases; and in order to find time to care for our bees we must have some quick method of performing all of the operations connected with the business, and each year we adopt new ways and means of saving time and labor, and giving better results.

### UNPACKING THE GLASSES AND PREPARING FOR WASHING.

Practically all of our tumblers come in barrels, while our jars are in cases. We can save considerable as we make our own cases; but we would advise any one not in position to make them to buy all reshipping-cases.

To do faster and easier work we have 200 trays holding four dozen tumblers each. These are made in the following manner: The sides are of wood  $3\frac{1}{2}$  by  $\frac{7}{8}$  inch. The bottoms are made of galvanized screen, and are held on by means of  $\frac{1}{2}$  by  $\frac{7}{8}$  inch strips. Similar strips are nailed across the bottom every 6 inches to support the screens. The tumblers and glasses are unpacked and placed in these trays. By the way, the trays are provided with hand-holes in the sides and ends, and, with the bottles, they are lowered into the water in the washing-tank, when immediately the glasses are all out of the trays and in the water in less time than it takes to tell it. They are washed, placed back in the trays, and allowed to drain for a few minutes; then they are placed one on top of another on a drier which is heated by steam-pipes. The hot air ascends through the piles of trays, and the moisture is thus carried off.

### LABELING.

Now for the labeling. The first thing is the table. It is a board two feet long and 18 inches wide covered with oilcloth. The table-top itself is pivoted on a shaft, so that it can revolve the same as a piano-stool, only it does not rise or lower except by a set-screw which is conveniently located for adjusting to a height suitable for those doing the labeling.

The labels are piled in bunches of about 500 each. One end of each bunch (the end further away) is pasted the same as a writing-pad. (It would be well to put a piece of mosquito-netting on the ends before or when pasting, as this holds the labels together better should the paste become brittle.)

We now paste from four to six pads of these

FIG. 1.—MR. ASPINWALL OPENING ONE OF HIS NON-SWARMING SKY-SCRAPERS.

When I visited Mr. Aspinwall I asked him to stand in front of one of the hives in order that our readers might see not only the hive but the inventor as well. He protested somewhat but finally consented, and here he is. He never uses a bee-veil, and says it is not necessary with his hives, because he does not smash any bees, and, what is more, there is no need of it. He has just removed the telescoping cover, and is now proceeding to pry up his honey-board.—ED.

EBRITO'S HONEYSUCKLE ARBOR FOR SHADING THE APIARY. THE RIVES FACE OUT, LEAVING AN AISLE PRACTICALLY FREE FROM BEES.

FIG. 3.—HOW MR. ASPINWALL PUTS ON SUPERS WITHOUT KILLING BEES.

The supers consist mainly of side panels and rods at the ends to produce compression on the panels and section-holders or wide frames. Between each two section-holders is a slatted dummy which at the same time answers the purpose of a fence or ladderway up between the rows of sections. The wide frames have top and bottom bars containing sections with full sheet of foundation, no bottom starters. By carefully examining the illustrations one will see side rails or bee-space strips that are nailed on the side panels. In putting on a super the bees are blown down through the sections with smoke, when the upper side is slid on endwise, riding on two side rails as a sort of railway track. For the next operation see Fig. 4.

he has not yet launched his hive on the public. He desires to test it still further, and then when he does offer it for sale he will leave it without change.

I may say that, while I was at his place, the weather was extremely warm, the thermometer at one time going up to 95 in the shade. Even in the evening it was insufferably hot; but neither in the afternoon nor evening were the bees clustered out in front of the hives. They were all inside, giving off that contented hum that indicates prosperity and that all is well. In some cases Mr. Aspinwall had put two colonies together as one. Then those great barn-like affairs, with their supers, would stand up almost shoulder-high.

At the time of our visit Mr. Aspinwall had secured already something like 2400 lbs. of fine comb honey in plain sections from 23 colonies; and to-day, July 22, I am in receipt of a letter from him saying that the 2400 lbs. had reached 3000, and he hopes to increase this amount very materially before the crop is all in for the season.

There has been no clustering out at any time,

nor any swarming, except in one case where he inadvertently violated his own teachings and practices. As the cause was easily ascertainable he feels that the one swarm did not in any way disprove his theory concerning non-swarming.

Mr. Aspinwall has originated a number of useful devices and kinks which I hope to speak of at some future time.

The subjoined illustrations give a general view of the Aspinwall hive and system of manipulation. The double-page picture shows the skyscrapers, nearly all of which contain sections fully capped over. Mr. A. had deferred taking off the honey because he wished me to see the hives just as they were. He was expecting to take off the filled supers the next day, and put on empty supers, as the bees were still working.

The note of explanation under each engraving will show the detail of management. In order to get the exact construction of the hive itself, one is referred to GLEANINGS for Nov. 15, last year, page 1441.

In closing, let me make it very clear that *this* hive is not for sale yet, and will not be until its inventor has fully perfected it in all its details.

## SELLING HONEY, AND THE VALUE OF COM- PETITION.

### Some Bright Sayings from One Who Has been There.

BY WALTER S. POWDER.

A very large crop of finest quality of honey has been secured this year, and the demand has never been better. The bee-keeper is not a master of his art till he has learned to market his crop successfully, and I fear that quite a few have overlooked the possibilities of establishing a home market, for everybody nowadays is willing to buy a pail or case of honey, especially if he can secure it from the man behind the bees. When the people once learn where a good article can be secured they will not only call for the goods but they will tell their friends and neighbors about it. One very important detail is to have the goods always on hand ready to supply those who call; and as honey is in demand the year round it is never necessary to sacrifice the price to hurry off the crop as soon as harvested. Many bee-keepers have a demand for honey which exceeds their supply, and are buying good honey in the open market with which to supply their patrons, and

FIG. 5.—HOW MR. ASPINWALL SLIPS THE BEE-SPACING STRIP IN THE END WITHOUT KILLING BEES.

By referring to Fig. 3 one will see that the spaces between the sides of the supers are closed by means of strips of wood nailed on to the side panels, and which at the same time answer the purpose of a sort of railway track on which the supers may be slid on and off. When one super is clear over, the other spaces at the ends are closed up with an end strip or stop. If there were any bees in the way they would be pushed out.

such men are a great benefit to the fraternity because they aid in relieving an overstocked market.

The bee-keeper is the best-qualified man in all the world to act as a honey-salesman, because he is prepared at all times to meet any argument that may be brought before him. If he is steady, and adheres strictly to handling best grades of honey, his business opportunity is almost unlimited. When business begins to come his way, about the first thing to worry him will be the discovery of a competitor in his field. This, however, should not worry him at all; for the more the business is agitated the greater will be the demand; and any successful business must have its competition and its imitators. Why, even our wiener-wurst peddler on the street corner, a man with a heavy bass voice, discovered a competitor across the street with almost no voice at all, and every time the strong man shouted "Wiener-wurst, red hot," the weak man with the tenor voice would cry out, "Same here!"

This is a great country, and there is plenty of room for all; but if your competitor tries to increase his profits by putting out inferior honey, or if he spends his time in trying to build up his goods by belittling yours, he is simply uncoiling a rope with which to hang himself.

In looking over the past it can be seen that the most successful honey-salesmen are those who sell direct to consumers. Selling bottled honey to the grocery trade seems to be a side line that has fallen into the hands of supply-dealers. Whether a bottler of honey can pay traveling expenses and hotel bills, and handle

FIG. 4.—MANNER OF PRYING THE ASPINWALL SUPERS APART.

Mr. Aspinwall uses a hive-tool of his own invention which is very similar to the Root steel tool. The end is bent over in the shape of a hoe, and sharpened to a scraping edge. In separating the supers Mr. Aspinwall uses the tool in the manner here shown. The open spaces in the panels make this particularly easy.

only the one line, remains yet to be successfully demonstrated. Successful bottlers of honey are aided largely by jobbing houses, such as wholesale grocers, where traveling men carry a large variety of samples.

Within the last decade I have seen a number of bottlers of honey apparently establish a large and successful business, but there seemed to be a turning-point where the business died down as fast as it had built up. The reason was that they attempted to increase their profits by decreasing the quality, and the public will not stand it. When bottlers begin putting up honey that is unfit for table use they are doing a great injury to the business, and yet it seems that the temptation is almost irresistible with many, and the successful bottlers of honey can be counted on the fingers of one hand to-day.

Consumers are willing to try a new brand of honey; and if it is good, and has merit, they will call for more; if inferior, they are not likely to want any more honey at all.

Indianapolis, Ind., July 28.

If one does only a honey-bottling business and buys all his honey, the chances are he will fail; but if he is a bee-keeper and produces a large part of the honey he bottles, he will have a fair chance of success, providing, of course, he is something of a salesman and is careful to get no bad accounts. Our correspondent has given some very helpful hints from a ripe experience. Some of his sayings are bright and pithy, to say the least. —ED.]

## SELLING HONEY IN MASON JARS.

**How to Retail Honey in Cities; a Form of Advertising where the Results are Immediate.**

BY H. H. ROOT.

On page 562, May 1, Mr. M. D. Tyler, of Seville, Ohio, was referred to as a veteran honey-salesman, and he is indeed a veteran, for his experience began more than half a century ago. The secret of his success is his natural ability to win sales. He says, "I never saw a thing yet that I couldn't sell." Any man can sell any thing to a purchaser who is eager to buy; but it takes a good salesman and a good talker to sell an article where it is not wanted. Mr. Tyler will make a man who thought he did not like honey wonder how he ever got along without it.

If a bee-keeper sells his honey to grocers, he will be very shortsighted indeed if he turns around and peddles more honey among the grocers' own customers; but there are many who do their own retailing in order to get a better price. After a retail business is established, much less "talking" is required to keep it going; but a glimpse of some of Mr. Tyler's methods may help some one to make a start.

In the first place, all of the extracted honey is put up in one-quart Mason jars, and sold for 50 cents each. This makes the selling price practically 15 cents a pounds, allowing 5 cents for the jar. For extracted honey, that is, of course, very good; but it must be remembered that the traveling expenses must be deducted, so that the amount finally received would not be so much more than

a good average price. If a customer wishes a quantity of honey he is given eleven quarts for \$5.00.

In the wagon shown in the engraving Mr. Tyler travels and carries his honey. He has recently purchased a new wagon that is larger than this first one, though made on the same plan. The carrying-box is divided into an upper and lower part, the floor of the latter being movable to make it more convenient to reach the jars. The upper half is divided into rows to prevent breakage.

Mr. Tyler visits all of the neighboring towns and cities, but makes no effort to sell in the country, for he has found that the little he could dispose of in that way would not pay him for the longer time taken. Neither does he try to sell any honey at the houses in the towns and cities. When asked why, he said, "Well, it takes the women folks so long to decide whether they want

M. D. TYLER, OF SEVILLE, OHIO, A BORN HONEY-SALFSMAN.

any; and if they do buy some, they take only one jar, and then send me down town to their husbands for the money, so I just go to the men in the first place. I like to deal with them better, anyway."

He stops at every shop and store, with the exception, possibly, of the groceries, and begins to talk whenever he can get a crowd around him, for he has found that he invariably makes sales when he can get into an argument. He explains how the honey is extracted, tells about the bees, and gets his hearers so interested that they soon begin to want some honey. When one sale is made, others follow quickly. He says that he talks fifteen minutes sometimes before trying to

sell any, and then gives every one as much as he wants to eat. After that, some one buys a jar, and all the rest do the same. In one shop in Akron he recently sold 22 jars, and in a large dry-goods-store near by, 24. On that trip he sold 1300 pounds in about three days. It is seldom that a store is entered where no one wants to buy. The bankers and merchants are always good customers. At one time he disposed of twelve jars in a police station. On the next trip every one is glad to see him, for all want more honey. On being asked how much honey he sold in a season he said that it would average about five tons. It is only recently, however, that he has been making a business of selling on a large scale.

Not every producer can sell honey profitably. One without the natural ability to make sales might go over the same territory, and not sell enough to pay the traveling expenses. Mr. Tyler simply shows what can be done along the line of retailing honey in cities. It can not be doubted that the grocers are slighted; but at the same time, in too many instances, the grocers make but meager efforts to advertise or sell the honey which they have in stock. It is possible to stir

up the honey trade by the methods here outlined, and, by referring all further inquiries to the grocer, get his co-operation.

#### PACKING COMB HONEY.

**A Moisture-proof Honey-carton; How to Pack the Sections so that they are Free from Dust and Flies.**

BY H. F. MELLEN.

We believe that the public has a right to the very best honey in the market. Comb honey is a luxury first; but it becomes a necessity when an appetite has been cultivated for a first-class article.

No honey, however fine when taken from the hive, can be called first class after being tumbled around in an unprotected condition for several months; and the only way to protect it properly is to seal each comb in an individual carton. All honey, but comb honey especially, is greatly injured in both flavor

TYLER'S WAGON FOR RETAILING HONEY.

TYLER'S WAGON FOR RETAILING HONEY.

and body, by the absorption of moisture from the air; hence a wrapper of paraffine paper is necessary.

There is no more reason why a grocer should show a comb of honey to his customer than that he should open canned goods, break eggs, or tear open the soap-wrappers or raisins carton to exhibit the contents to an intending purchaser. The name upon the goods should be a guarantee to both the grocer and customer.

The grocer handling our honey last season found no trouble in disposing of it without allowing customers to inspect it, and he summed up the matter pretty fully by saying, "I don't care a fig whether the people can see the goods; what I want is an article that, when eaten, sends a customer back for more." If a dealer has once had *first-class* goods put up in an attractive way by the apiarist, little trouble will be experienced in inducing him to buy again. *Inferior* goods, though put up in the finest style, not only injure others but surely ruin the producer.

The accompanying photos show our honey and cartons in the several acts of packing. Fig. 1 shows some of the cartons in the flat, leaning against the wall on the shelf. Just below, and to the front, are the forms upon which they are made up. On the form to the right (shown at the left of the picture) is a lead weight placed upon a carton just pasted, to hold it in place while setting. This weight is moved to the other form when the second carton is ready, and the first carton is then thrown to the packer. Library paste is used, which sets as fast as the cartons can be folded. To the right can be seen a couple of sections, one about to be wrapped in paraffine paper, and the other wrapped and ready to slip into a carton.

FIG. 2.—COMB HONEY IN CARTONS PACKED IN SHIPPING-CASES.

The cartons containing honey ready to be sealed and placed in the case are shown at the right.

Fig. 2 shows a case of honey packed ready for the cover, and also a couple of cases with some packed cartons of honey on top.

There are many good features of this package. First, its moisture-proof paraffine inner wrapper; second, the plain marking of the grade of each package upon the top, which is done with small rubber stamp, thus—"Fancy Amber," "Fancy White," "A 1 Amber," etc. Upon the bottom of each carton is stamped the private mark of the individual packer, so that the dealer can fix the blame, if any. Third, the neat protecting carton, which seals and protects the honey, not only from moisture but from flies, dust, and germs, and the desecrating hands of all clumsy handlers. These features are set forth to the customer in a neat little paragraph upon the sides of the cartons.

Acton, Cal.

[Canned goods, soap, etc., are uniform as to quality and quantity, and there is nothing gained by examining each package. *If honey is properly graded* a customer would not need to see each section before buying. But as honey does vary, especially from one grade to another, there may be some excuse for showing it. Fancy white comb honey sells itself.—Ed.]

FIG. 1.—MELLEN'S METHOD OF FOLDING CARTONS AND WRAPPING SECTIONS IN PARAFFINE PAPER.

## PREPARING COMB HONEY FOR MARKET.

### The Importance of Scraping Sections and Sandpapering Shipping-cases; Some Wholesome Advice from One who has Had a Large Experience.

BY DR. C. C. MILLER.

When a nice section of honey lies on a plate on the table, what does it matter what kind of case contained it when it stood in the grocery? Does the eater stop to inquire whether the wooden section that contained the comb was neat and clean, or whether it was well covered with bee-glue? Of course not. But because it makes no difference after it's on the table, don't you fool yourself into thinking it makes no difference before it gets there.

Suppose two cases of honey stand side by side in a grocery. One of the cases shows signs of travel and previous use, and even in its palmiest days it was never a very neat affair. The other is neat and clean—same difference in sections. Those in the one case have been nicely cleaned of all glue; in the other case, the sections are just as the bees left them, and are plentifully daubed with glue. The average customer, upon being told that there is a difference of 2 cents per section in the price, nothing being said about comparative quality, will very likely elect to pay the extra 2 cents. If the grocer says, "The honey itself is just as good in one case as in the other," some will choose the honey at the lower price; but some will say, "It may be so, but every thing about this case looks so neat and dainty that it must be a little cleaner than the other, and likely just a little better." But the grocer himself is likely to be impressed with the opinion that there is really greater value in one case than the other, and that opinion affects him, both in buying and selling, and so from first to last this case of honey, "just as good as the other," is handicapped by its appearance.

Even if the difference be only a cent a pound, it will cost you only a fraction of a cent to have the better class, and the remaining fraction of a cent makes quite a tidy sum when your crop is large. Besides, if the outside appearance in the grocery is inviting, many will be tempted to buy who would be repelled by something less attractive.

You can save a little on shipping-cases by having a narrower strip of glass, but it is poor economy. Either on the grocer's counter or piled up in the wholesale room, the more glass the finer the honey looks. But there is no advantage in having glass on two sides, as only one side can be seen at a time.

To a bee-keeper there is nothing repulsive in the appearance of bee-glue, but to the average consumer there is; so, don't send any bee-glue to market. Your supers may be of such character that the section is mostly covered, but hardly entirely; and wherever the bees have a chance they are likely to squeeze in at least some glue—the later in the season, the more glue. Perhaps your supers allow the bees free access to tops, or to both tops and bottoms. In that case make a wholesale job. Wedge the sections into a frame

a little less in depth than the depth of the sections. Take a cabinet scraper and give the surface a good scraping. Then take No. 2 sandpaper and sandpaper down till the whole surface of the wood is entirely new and clean. Wonderful what a change you can make! The superful of sections, while you are doing this work, should be standing on a board as large as or a little larger than the size of your super. When you have finished cleaning that surface, lay a similar board on top; turn the whole business upside down, and clean the other side. Then with a caseknife kept pretty sharp clean off the edges of each section, resting the section on a block perhaps the size of a section.

Don't lose money by false grading. Let the sections that are next the glass in the shipping-case be a fair sample of the whole case. But you are allowed to put the best side out of the sections that are next the glass, just as the best side of a section will be uppermost on the table.

If your bees have stored first-class honey you may as well have every thing in first-class shape and get first-class prices. Keep that up for a few years, and you will have no trouble in finding a market, perhaps getting into that class whose honey is sold before it is taken from the hives.

Marengo, Ill.

[Here is some good wholesome advice, and we hope the small producer, at least, will cut it out, even if he does mutilate his journal, and paste it in his hat or on his honey-house door.

It is a lamentable fact, and almost an outrage, that so much comb honey goes on the market without either scraping or grading, and in cases that are either soiled or homemade. Oh the penny-wise-and-pound-foolish policies we see among some bee-keepers! Why do they hold their noses on the grindstone? Why do they throw away dollars and dollars when a few cents' worth of time would save them? If they would heed this good advice of Dr. Miller, they could save a fine profit which they now lose. As it is, they bring down the prices of all honey.

In talking with a honey-dealer the other day we asked him what percentage of the honey came in scraped and graded. His answer was, after some little reflection, "Sixty per cent of the fancy and only about 20 per cent of the No. 1." Just think of it, brother bee-keepers! Do you belong to the class of the 80 per cent who think it does not pay to scrape and grade your honey before shipping to market? And you who propose to put up a fancy article, do you belong to the 40 per cent who neither scrape nor grade?

You may say that a "fancy" honey is a graded product. It ought to be, surely; but in the goods marked "fancy," the dealers tell us they often find No. 1 and 2, all in the same case. Such shiftlessness, or, perhaps, we better say *dishonesty*, is enough to make one cry if it would do any good.

It is assumed, of course, that the readers of bee-journals do not belong to the class who do not scrape or grade their honey; and the unfortunate thing about it is that our scolding does not hit them. Those people can not afford to take a bee-journal, and have not time to fix up their honey so as to make it sell—"any old case will do;" and if the sections were on the hive last season, all covered with stain and propolis, "they

are good enough" for this year. It is these same people who will cobble up a shipping-case of their own, out of drygoods-boxes. Oh, no! they can not afford to send away and get good cases; but they can afford to lose several cents per pound on their honey. No, they will sell at any old price simply because they are not keeping posted as to the markets.

We have almost a mind to have this article of Dr. Miller's set up in the form of a leaflet, and send it out with each package of sections and shipping-cases. Shall we do it?—Ed.]

## GRADING AND PACKING COMB HONEY.

### The Importance of Having all Honey a Little Above Grade; How to Tell Whether the Grading is Properly Done.

BY WESLEY FOSTER.

The honey-producer who is going to make a success of his business in the future will be imbued with the spirit of mutual benefit. He will be filled with the knowledge and feeling that he is giving more value than he is paid for. It may be foolish to put No. 1 honey on the market as No. 2, but that is a deal more honorable than to have the honey always just a little below grade. Why not have comb honey just a little above grade, so the buyer will be sure to get the honey *at grade*, for honey does drip and deteriorate somewhat in shipping?

When every case of No. 1 white and No. 1 light-amber comb honey is as even in quality and as neatly put up as a box of bon-bons, don't you think the honey-producer will be recognized as a person of quality? The quality bee-keeper makes kindling-wood of his leaky covers and uses the gunny sacks for smoker fuel instead of for blankets on his supers; neither does he allow the mice to scallop his sections.

The grading-rules do not forbid putting a section gnawed by mice in a No. 1 or No. 2 case; but it is not good practice. The rules can not mention every catastrophe that would bar a section from the given grade. I would not care to buy a box of crackers with a mouse-hole in one corner. The rules do not forbid a section with a part broken off or an imperfectly folded section, or one diamond-shaped; but if the grader is not a conscience-juggler he will at least bar these from the No. 1 grades. His judgment will decide whether sections of this class should be No. 2 or culls.

At a bee convention, when the subject of grading comb honey was under discussion, I saw illustrated just how a No. 1 section should look to come

well within the grade, and just where the dividing line between No. 1 and No. 2 is. One bee-keeper who had difficulty in distinguishing between a slight and a pronounced tinge in comb color, and manifested an unwillingness to try to see the difference in light amber and white in the color of the honey, asked an experienced bee-keeper and shipper of comb honey what rules he followed. He said he put himself in the buyer's place and then followed the rules, pushing the faculty of fine discrimination to the limit. One can soon find out whether he has been using fine discrimination by going to a pile of honey if he has some from the best to the poorest, and picking out combs of the whitest honey, then slightly amber, light amber, and amber of a pronounced color. If he can mark these and then mix them up and separate them the second time, and get them into the same arrangement as at first, he may be sure he has the discriminating faculty. The greatest trouble comes with me when trying to tell slightly amber from light amber.

Now, many get the color of the honey and the color of the cappings mixed; or, rather, they do not discriminate. Cappings may be white over an amber honey, or they may be dark over a white honey.

The committee on grading-rules for the Colorado State Bee-keepers' Association, when they came to describing the color limits for cappings to No. 1 light amber, first wrote it this way: "Comb and cappings white to grayish or light-brown tinge;" but upon consideration they changed it to read, "White to off color, but not dark." The reason for changing was that some would construe that light-brown tinge to include dark cappings, which would not come up to the name of light-amber comb honey. Now get this firmly fixed in your mind. You must, to do the best grading, carry these two items in mind—color of comb and cappings, and color of honey. They must not be mixed in the grader's mind. He must look for color of honey and color of comb in each section.

No. 1 white comb honey. The honey must be white or *slightly amber*, while the comb and cappings must be white with no slightly any thing to it.

As for No. 1 light-amber comb honey, the honey may be white or light amber, while the comb and cappings may be from white to off color, but not dark.

The grader who discriminates the slightly amber honey of the No. 1 white grade from the light-amber honey of the No. 1 light-amber grade is getting his work down to an art. The line between white comb and cappings of the No. 1 white and the "white to off color, but not dark" of the No. 1 light amber is not so difficult.

Some disagree as to where off color runs into dark which should

WATERING-DEVICE FOR LITTLE CHICKS.  
See Poultry Department.

go into No. 2 grade. The ideas of grayish to a light-brown tinge may help some here. Remember, though, a light-brown tinge is not light brown, for a light brown on a comb of honey is dark.

When ready to start packing comb honey, I get a boy to nail the cases so they do not lie around more than a day or so to gather dust and fly-specks. Nails for the drip-sticks are not as satisfactory as a little thick honey. The nails will sometimes come through. In packing, the cases are set on a bench so the top of the cases comes to the top of the table on which the honey is piled.

The scrapers have the scraping-box on the opposite side of the table from the grader, so there is no danger of scrapings getting into the cases of honey. The grade is marked on the case before the cover is nailed on, and before the honey gets to the pile. A plane is kept close by to plane off any extra wood from either the bottom or cover of the case.

In piling the honey in the storage-room it is best to pile the face out, so if any flies get in the cases they can be let out by pulling a nail and sliding the glass. And then I like to look my honey in the face several times before selling. The time spent in admiring a pile of white comb honey is not wasted—it's a very profitable task; 'twill keep one always on the alert for better methods in producing a *de luxe* article.

The recommendation supplementing the Colorado State Bee-keepers' Association grading-rules embody some of my ideas on grading and packing comb honey, as I was one of the committee; and what the committee says I should like to add to this article.

#### REMOVING AND HANDLING FILLED SUPERS.

Comb honey should be taken off as soon as completely capped; no more smoke than necessary should be used, and the smoker kept well filled with fuel so no ashes will blow out and spot the cappings. If finished supers are stored in the honey-house, one or several sheets of newspaper should be used between supers to catch any possible drip and keep out dust and ants.

#### NAILING AND MARKING CASES.

Cases should be well nailed with cement-coated nails, and glasses perfectly clean. If edges of covers and bottoms project they should be planed off; if this is not done, many boards will split in shipping. The whitest and smoothest boards should be reserved for covers, and the others used for bottoms. The paper trim in the bottom should be evenly folded, and drip-sticks secured in their proper places by the use of a little glue or thick honey on their under side. Nail cover on firmly when the case is filled. The mark of the grade of honey should be put into both hand-holes of the case: X stands for No. 1 white; one dash for No. 1 light amber; two dashes for No. 2. The marking of filled cases should be done before they go to the storage-pile. Second-hand cases should be used only for the casing of cull honey—never for the shipping-grades.

#### CLEANING AND CASING HONEY.

This work must be done in a well-lighted place, and a large bench or table provided for it. The shipping-cases to receive the honey should

be placed so as to face the packer, and should be arranged so no propolis from scraping will fly into them. It is desirable to have several cases for each grade on the bench, so that honey of the same shade and finish may go in the same case. A definite place should always be used for each grade, to avoid errors in casing.

An accurate spring scale should be handy to weigh doubtful sections.

The practice of piling honey on the bench before casing is not recommended, as honey is more subject to injury, and time is lost in casing. It is desirable that the packer have a copy of the grading-rules hung up before him for ready reference; and where this work is entrusted to others, the apiarist should provide specimen sections representing the poorest of each respective grade, and give strict orders that anything inferior to these samples must go in the next grade below.

The face of each case should be of uniform color and finish, and truly represent the contents of the case.

Cull honey is composed of the following:

Honey in badly stained sections caused by leaky covers.

Honey that shows signs of granulation. Sections that are leaking, or whose cappings are injured.

Sections that are fairly well capped, but have more than 25 open cells.

Sections that are capped, but weigh less than 12 ounces.

All cull honey should be marketed around home, or rendered.

#### HAULING OF COMB HONEY.

The proper time to haul and ship comb honey is while the weather is still warm, therefore no time should be lost in getting the crop ready. In hauling by wagon it is desirable to provide springs for the wagon-bed; and if these can not be had, a layer of three or four inches of straw should be used in the wagon. On top of this should be spread a canvas or large wagon-cover, in such a way that, after the wagon is fully loaded, the canvas will fold over the top of the load, thoroughly protecting the honey from dust or a possible shower.

The bed of a regular farm-wagon will take 98 cases of honey. A good steady team and careful driver are required to haul comb honey safely.

Boulder, Colo.

[In a letter in connection with this article Mr. Foster explains that all his packing is done according to the rules of the Colorado State Bee-keepers' Association. He believes that those rules are valuable, especially if the time and thought of experts are worth any thing. He says, "We have fought and jawed and voted in committee and on the floor of the convention over these rules."—ED.]

#### A WARNING.

UNDER the national pure-food law, perhaps we may remind some producers that they are rendering themselves liable to Uncle Sam if they sell amber honey for white clover, or, in fact, misrepresent the source of any honey on an interstate deal.

## SPACING BROOD - FRAMES WIDER APART FOR WINTER.

BY E. N. WOODWARD.

I am not aware that I have ever read or seen an article in any of the bee-magazines on this subject. If the question has been a topic of discussion, and if bee-keepers, accordingly, have adopted  $1\frac{3}{8}$  spacing as being at all times correct, then I think it would be well to reopen the question for further consideration.

The severe losses during the winter and spring, with now and then an exception, prove that the successful wintering of bees is still one of the most important questions. If I were to look over the back numbers of the different bee-magazines and quote from editorials or from different contributors on the subject, a large percentage of loss would be shown even among those who claim to be expert in the general management of bees. If I were to report from my own locality (Southern Michigan) I would say that ten per cent loss is not a high estimate, as it averages from year to year. The question presents itself, then, "How can this severe winter loss be avoided?"

I am writing this from an outdoor-wintering standpoint, and I wish to say that, according to my experience, we are spacing our frames too closely for the successful wintering of bees in this northern climate, so I am trying to work out the solution along lines that are more practical and which are more in harmony with the general law of all insect life.

Every one will agree with me when I say that an isolated bee is of no account. It is equally true that a thin spreading of bees sandwiched in between two closely spaced frames are of very little account. To confine them thus for a long time, with a winter temperature outside, deprives them of their vitality and their moving power. It is not giving them a "square deal." Martyrs they are to our misconception of what is essential to their comfort and to their very existence. I hold that each separate sectional cluster between the frames should be strong enough to maintain and impart a sufficient degree of warmth and vital force to make this cluster a community of itself. This enables them to cover their brood and build up stronger in the spring, and the trouble of spring dwindling is not even thought of.

Now, to carry out this community law I propose to space my frames not less than  $1\frac{1}{2}$  inches from center. In other words, I space equally the eight frames in the standard eight-frame hive with no dummy. To my mind it is clear that bees will winter in a more natural and healthy condition if they are given even this extra room to cluster in larger bulk. This larger cluster closely packed enables them to hold their normal temperature, and gives them the power to generate and impart one to another their collected store of animal heat and health-giving odor, even to the outside limit of the hive; and thus they live and thrive the entire winter and spring.

I have no word to say against cellar wintering. I prefer to winter my bees in outdoor winter cases; and, if properly packed, I have no anxiety in regard to them. However cold it may be when

the opening bud and the warm sun shall tell us that spring has come, I expect them all to respond to the roll-call. I have not adopted this plan or come to these conclusions without a reason.

My neighbor across the way is a bee-keeper in a small way, and packs his bees in winter cases following my plan, and they are sure to come out bright and healthy in the spring. His Hoffman frames have become so thoroughly propolized and enlarged that seven of them will nearly fill his eight-frame hive, and they go into winter quarters in this spread condition. When I used to space my frames more closely and lose more or less of them during the winter and spring, his would come out bright and strong.

Another bee-man near me, so-called, makes his own frames out of common lath pieces, and spaces them  $1\frac{3}{4}$  inches. He has no protection whatever. The northwest wind sweeps along the hillside with a temperature often below zero, yet his winter losses are not worth counting. Now, if spreading the brood-frames is not the secret of this uniformly good wintering, will some wise bee-keeper stand up and enlighten us on this most important question?

Hillsdale, Mich.

[Some fifteen or twenty years ago it was the common practice to spread the frames toward the approach of winter for the outdoor colonies, as it was argued that the bees needed more clustering room between the frames. In short, precisely the same arguments were advanced that you present. Finally some began to say that there was no advantage—that just as good results would be secured with the summer spacing of  $1\frac{3}{8}$  inches from center to center. Gradually nearly every one, including ourselves, left the same spacing the year round. We tried both ways—about 15 years with the wider spacing for winter, and for the last 20 years we have been using the summer spacing. There has been no appreciable difference in the results, so we concluded that there was nothing gained, and, if we are correct, that was the conclusion arrived at by nearly every one. The point is, there is *practically* no difference between  $1\frac{3}{8}$  and  $1\frac{1}{2}$  inches that you advocate. Or, to put it another way, the difference is too small to affect the actual result. The difference to which you refer must be due to some other cause.—Ed.

## A PLEA FOR BETTER QUEENS.

BY J. E. HAND.

I noticed in GLEANINGS for Oct. 15, 1907, that Dr. Miller quotes Rev. Mr. Luger, *Deutsche Bienenzucht*, as saying that "the masterpiece of bee culture is not wintering nor yet springing, but queen culture." Now, that strikes me as being about the most common-sense statement that I have heard for a long time; and while the editor's remark, that one is about as important as the other, seems quite reasonable, yet when we consider what the queen is to a colony of bees, and how much is written upon subjects of comparatively minor importance, and how little is written upon the subject of queen culture, we can not but acknowledge the wisdom of our German

brother's statement. The queen is the very mainspring of the existence of a colony of bees; and, aside from this, the exact relation of the queen to successful comb-honey production is not generally understood, even by so-called expert honey-producers. Therefore the subject of queen culture is of vastly more importance to the honey-producer at *this* time than all other subjects combined. It is a fact greatly to be deplored that this most important branch of apiculture is the most neglected of all; and it is no less true that most of the so-called improved methods of modern queen-rearing in vogue in this country at the present time (some of them even claiming to be scientific works) are the bane of modern apiculture, and a direct menace to the interests of our beloved pursuit, bee-keeping. It is a deplorable fact that at least half the queens that are reared by these alleged scientific methods are actually not worth the time required to pinch their heads. What the bee-keepers of this country need to-day is a better knowledge of the true relation of the queen to successful apiculture. There is something of vastly more importance, especially to the producer of comb honey, than merely having any old queen in each colony of bees; for if the queen lags or fails to do *her* duty during the honey-flow, the bees will quickly take advantage of the fact to fill the brood-chamber with honey, to the utter neglect of the supers; while with a vigorous and prolific queen the brood-chamber would have been held for brood, and practically all the honey would be forced into the sections.

For many years bee-keepers have wondered why it was that certain colonies in the apiary would far outstrip others of equal strength, and which, so far as *they* could see, were in as good condition to store honey as were the others. This condition of things has become so common in our present loose methods of allowing the bees to requeen themselves at the expense of the honey crop that some of our best bee-keepers of to-day count upon having ten to fifteen per cent of their colonies practically unproductive; and, judging by my experience along this line in the production of comb honey, the per cent of unproductive colonies would be much greater than the above. With proper attention to the *queen* part of apiculture there is no more excuse for the up-to-date progressive honey-producer to allow a part of his *apiary* to become unproductive than there is for the farmer to allow a part of his farm to become unproductive through neglect and failure to attend to his business.

One noticeable feature about the writings of those bee-keepers who advocate the wasteful, shipshod, unbusinesslike methods above mentioned is that they never attempt to explain *why* it is necessary to keep a lot of no-account colonies; and we must, therefore, conclude that there is no *cause* for such a condition, and attribute it to *luck*. Well, I should think it would be mighty hard luck for the bee-keeper who would tolerate such a condition in his apiary. What the bee-keeper and the farmer of to-day need is not more bees and more land and shipshod go-as-you-please methods, but a better knowledge of how to secure best results from what they now have; and when they have brought their present farm or apiary up to its highest state of produc-

tiveness, then, and not before, is the time to invest in more bees and more land.

It is about time some of the old threadbare theories were exploded, and that bee-keeping as a pursuit should take advanced ground.

I shall have more to say upon the subject of queen-rearing and queen introduction and manipulation; and in conclusion I wish to join hands with our German brothers in the statement that queen culture and a better understanding of the true relation of the queen to successful comb-honey production are the *sine qua non* in successful bee-keeping.

If I am not mistaken, it was W. Z. Hutchinson who, several years ago, made the remark that, other things being equal, one queen is as good as another; and that statement has been sticking in my crop ever since, and somehow it still refuses to go down; but I hardly think Mr. H. would consider the statement as orthodox at the present time.

Nov. 24, 1907.

[The statement that "it is no less true that most of the so-called improved methods of modern queen-rearing in vogue in this country at the present time, some of them even claiming to be scientific works, are the bane of modern bee culture, and a direct menace to the interests of our beloved pursuit," is, it seems to us, wide of the truth. We will admit that but little progress has been made in the improvement of stock; but that half the queens reared "by the aid of scientific methods are actually not worth the time required to pinch their heads off" is both unjust and severe. Doolittle's book is named "Scientific Queen-rearing;" and if ever a writer made a plea for stronger and better queens it is Doolittle. It is he who placed strong emphasis on the rearing of queens at a time when bees would feed the cells most lavishly; and yet, according to the author of the above, this book seems to be principally singled out. We will admit that a lot of poor queens are sent out; but they do not come from our best dealers who have had years of practical experience. We have too much confidence in the ability of our old queen-breeders to think otherwise; but our correspondent, for all his strictures on American queen-rearing, makes a good point when he discusses the true relation of queens to successful bee culture; and we commend that portion of his article, at least, to the careful consideration of our bee-keepers who keep bees because of the bread and butter they can and do earn.—Ed.]

---

## WAX-RENDERING.

### How to Convert a Steam Wax-press into a Superior Hot-water Press.

BY F. W. LESSER.

For several years I have been using a Root steam wax-press as a hot-water press, and have been very much pleased with the results, both in the amount of wax secured and the speed with which it was obtained. I frequently render 100 lbs. and over in a day from old combs. To convert the steam-press into a hot-water press, all that is necessary to do is to solder a piece of tin over

the place for putting in water, and provide a tight-fitting cork for the outlet. Or a gate or valve can be soldered on.

To make the press several times the capacity of the one-cheese press, about eight division-boards are needed between the different cheeses, as six or eight cheeses are pressed at one operation. These boards should be nearly as large in diameter as the inside of the press (discard the wire-cloth basket, as it will tear the bags), and made of  $\frac{3}{8}$ -inch wood with  $\frac{3}{8}$ -inch-square slats nailed on one side  $\frac{1}{2}$  inch apart, and these covered with  $\frac{1}{4}$ -inch-mesh galvanized wire cloth. Eight burlap bags one foot wide and 18 inches long are also needed.

In operating I use an old cook-stove in the cellar. This is large enough to hold both the press and a large wash-boiler in which the combs are melted. A hot fire is needed, and the refuse pressed. Slumgum, when a little dried, together with wood, makes a hot fire.

To fill the press, first put in a division-board (a plain board will do for the bottom of the press); then a bag of melted comb; then a division-board, slat side *down*, and so on until the press is full, when pressure is applied, a little at a time, until the next batch is ready, and until you have applied all the pressure you think it is safe to subject the press to. If necessary, pour in hot water enough to bring the wax above the top cheese, where it can be easily dipped off with a ladle.

In filling the bags with the melted glumgum, hook one side over the projection on the top edge of the press. In this way it is easily held open and the slumgum dipped in. Four to six quarts is about the right quantity for a cheese. Then it is let down in the press, and the top given a twist.

When it is thought that the refuse has been pressed sufficiently, all the wax is dipped off the top and the water drawn off into a tub. Then the screw is released and the cheeses taken out and emptied for the next lot. A bent wire hook is used to get the cheeses out of the press.

You will be surprised at the very small amount of wax (if any) you will be able to discover in the refuse; and the quality is all right too. I have gotten out many thousands of pounds in this way, and have had no complaints.

If one thinks more wax can be obtained by the so-called washing process than by continuous pressure, it is easily done by simply releasing the screw a few minutes and then applying pressure again. But I have not been able to get any more wax in this way. Possibly the thin cheeses account for this.

I have tried pressure on a larger and smaller scale, both hot and cold, but this press and method suit me best. For amount of wax secured, and ease of operation, I do not believe an open press can compare with it.

Several years ago I used the Root press in this manner with steam instead of hot water. This was a very good way, but did not give quite as much wax as with hot water.

Syracuse, N. Y.

[Our correspondent does not say whether he ever tried pressing the refuse a second time in the same manner to see how much more wax could

be obtained. We have rendered a good deal of wax by this method, using the steam-press as a hot-water press; but our opinion was that, if the hot-water plan were to be used, a can larger in diameter in proportion to the height should be used in order to permit of a greater heating surface. It is practically impossible to see wax in refuse that may contain as much as 10 to 15 per cent; and the only way to be sure that there is not too much waste is to repeat the whole process on the refuse.—Ed.]

## WHY THE BEES DIED.

### Poor Results from Cellar Wintering.

BY COLUMBUS CONGER.

I very much wish to know what is wrong with my bee-cellar. It is of stone, 7 ft. high, 14×18 feet in size, built into a bank on the west side, which comes nearly to the top of the wall, with a little of the bank on the north and south, and a double door on the east, which is the only place where I could have the door. The floor of the cellar is cement. The first winter I had for ventilation one 5-inch tile built into the wall on the south end, and a 3-inch tile on the north end, about 12 or 14 inches from the top of the wall. I put 60 colonies of bees in the cellar, and nearly all died.

Early in March I had to set them out, for they were all moldy and wet, and were dying every day, some of starvation, but more of the dampness, so I concluded they would be better off out than in, even if it were too early. I had only 14 colonies left for the summer harvest.

I concluded that the ventilation was at fault, so last fall I put a ventilator in the middle of the cellar, made of dimension boards 10×12 inches, which comes to the bottom of the cellar and up through the honey-house, which is above the cellar, with a single floor between. The ventilator extends about two feet above the honey-house roof, and the opening in the cellar is at the bottom near the floor. Then the tile on the north end I filled up, and in the one on the south I inserted a pipe with an elbow, which lets the cold air in near the floor also. I put about the same number of bees in the cellar last fall, with about the same results. I had to set them out earlier than I wished to this spring, because they were moldy and dying. Most of them had honey in the hives, but the combs are covered with mold. They were in good condition when placed in the cellar. The bees were placed in the cellar with the hive-covers removed, and were covered with a wire screen, and quilts for each hive. Now, I should like to have some one tell me just what is wrong, and what would be the best and cheapest way to fix this cellar. I have thought of building a room over the door on the east side, in which I could have a stove, and heat and ventilate it that way. Is this advisable?

The temperature of this cellar has been about 30° all winter. I think it is too cold, but I do not know how to alter it.

Glenbeulah, Wis., March 26.

[It is very clear where your trouble lies. Your cellar is altogether too cold and damp. With a

temperature of 30° all winter it is no wonder that your bees die. It will be very easy to modify this difficulty by putting a small stove in the cellar or in an outside vestibule, as you suggest, the heat to go from the vestibule into the cellar. This would serve to raise the temperature, and at the same time remove the surplus moisture. An excess of dampness, with a temperature below 40, is very fatal. There should be a fire in the stove during the coldest part of the winter, or whenever the temperature goes below 45. Even if the fire be continued only two or three hours, raising the temperature say to 50 or nearly 60, and it then goes out, and the temperature drops to 42 or 43, no harm will be done. The moisture will be taken care of, and the bees will be kept clean and sweet.

The great trouble with many bee-cellars is that they are too warm because not sufficiently underground some parts of the winter, and altogether too cold at other times. Bee-keepers need not be afraid of using stoves, providing they do not get the temperature too high, as ordinarily it should not go above 50 nor below 40; 45 is the most desirable point. Some cellars filled with bees will maintain that temperature throughout the winter; and where that can be done, no stove and but very little ventilation will be required, as the bees are in a state of semi-hibernation when respiration is very much subdued.—Ed.]

## HEADS OF GRAIN

### FROM DIFFERENT FIELDS

#### DISPENSING WITH SEPARATORS.

In the new ABC book, p. 118, you ask the question, "Why not dispense with separators altogether?" and then you answer, "We can, by using narrow sections." Now, in dispensing with separators what kind of section frames or containers shall we use? Shall they be plain ones, and placed wide enough apart to leave a bee-space, or shall they have the usual bee-space cut out and use open sections to match? It seems to me sections as narrow as 1½ with openings for beeways would be impracticable. Another thing, I should like a section that would hold a full pound, and for that reason would prefer a 4×5 section 1½ inches wide. But would that be as desirable as the narrower section, in our effort to get rid of the separator? It does seem to me that, if we can succeed in doing away with the separator, a long stride will have been made in simplifying honey-making. The modern bee-hive is entirely too complicated, and has a great deal too many loose parts or pieces.

Whitehall, Ill.

A. W. FOSEMAN.

[To do away with separators would require the same spacing from center to center as our brood-combs. This would mean beeway sections open on all four sides, 1½ in. thick, or plain sections ¾ in. thick. Obviously, the former would be more suitable—or, rather, they would not look so thin when filled as the others.

As to containers, section-holders, or wide frames, could be used. Full sheets of foundation—the "thin," not the extra-thin—should be

used, as there should be no buckling nor stretching. The foundation should be well fastened, and the hive plumb from side to side, providing, of course, sections were parallel with the sides. It would not be practicable to make a 1½-thick beeway section hold a pound, as it would be too large; and a ¾-inch plain section would look more out of proportion yet.

A 4×5 plain section 1½ in. thick could not be used without separators or fences.—Ed.]

#### SHORT-LIVED QUEENS; HONEY CANDIED HARD IN THE HIVES.

We are located at the foot of the Big Horn Mountain, and have about 300 colonies in eight and ten frame L. hives. They are in fine condition, needing only sunshine. Our pasture includes the numerous wild flowers, together with dandelion, white and crimson clover, alfalfa, and the famous sweet clover. Bees do exceedingly well.

I should like the advice of your contributors in overcoming a trouble that we have. Our queens seem very short-lived, for they die leaving the hive full of stores. This may occur at any time of the year. Our honey also granulates in the hive. At this date we have several thousand pounds in the hives that is as hard and dry as granulated sugar.

FRANK JONES.

Buffalo, Wyo., June 7.

[We should be glad to have any subscriber in the vicinity, or like environment, who can offer an explanation, let us hear from him. The difficulties mentioned must be due to some special local conditions, and we will not attempt to answer it at this time.—Ed.]

#### HIVE-LIFTING DEVICES; SHALLOW HIVES NOT ADAPTED FOR BEGINNERS; WAX-RENDERING.

In an editorial I notice what is said about hive-lifting devices. This is what I wanted badly the last two months. You see I kept the bees from swarming by adding shallow extracting-supers till about June 25, and kept adding them till I had them 30 in. high. Toward the last, just before shaking, it was a task to get an empty shallow super just over the brood-nest. I had to call help the last time.

After shaking the bees out in shallow hives and arranging for comb honey I took all that was on the stands of seven colonies and piled them all on three stands. This made them quite high. To get at the lower supers would have been too much work, and a hive-lifting device would have come in nicely to handle them. If you get up something in this line I want one. You may say Salisbury wants every thing new to try, like the N super and Aspinwall hive. Really I enjoy these new things.

On page 878 I notice E. F. Atwater advises against the use of divisible hives. He voices my sentiments exactly when he advocates cautioning beginners against their use. These hives can be used only by experts in the business. Pollen will be found in the sections unless perforated zinc is used in plain sheets. The plain sheets will help very much to keep out the pollen. The best hive for beginners is, according to my notion, the regular Dovetailed hive.

On page 887 an article on wax-rendering attracted my attention, and I wish to agree with Mr. Byer in regard to the unheated and heated wax-presses. His conclusion recommending the use of the unheated press is in line with my ideas. The footnote of editor is also entirely correct.

Syracuse, N. Y.

F. A. SALISBURY.

combined by running a cord through the center of the square cleats, and tied at the corner of the hive. The cleats should be one or two inches shorter than the length of the sides of the hives; that is, if the hive is 20 × 14, the pieces or cleats should be 18 and 12 inches respectively.

Oswego, N. Y.

F. H. CYRENIUS.

VESTIBULED AND PROTECTED ENTRANCES.

This is a very important branch of our pursuit, especially during the cold spring days. The chaff and double-walled hive with wide-open entrance is to me like building a warm house but leaving the door open. Bees need some ventilation; but very little is necessary in cold days. I am wintering some with an entrance the size of a leadpencil.

I send you one of my windbreak entrances. The bees, to go in or out, must pass up and down over. As you will see, this prevents the wind from blowing right into the hive. In connection you will also find an automatic closing entrance in the form of a button which may be swung up back out of the way in warm weather. The bees must learn to crowd their way through it, which they will do if the threads are not made too thick.

#### FASTENING PAPER AROUND THE HIVE.

In the Nov. 15th issue of GLEANINGS, p. 1436, we find directions for fastening the paper around the hive with a cord. It is not possible that the

[Last spring we made up some entrance-stops like those shown in the drawing; but our apiarist, Mr. Bain, was not sure they were a real benefit. The bees acted confused. This may have been, and probably was, due to the fact that the stops were put on *after* the bees had had several flights, and to a certain extent had become accustomed to the entrance as it was all winter. The putting on of these new appliances may have confused them to their hurt. Possibly if they had been put on the November previous the results might have been more positive.]

Here is another sample of an entrance-stop or windbreak on the same plan as yours, except that

it lies horizontally, thus enabling the bees to carry out their dead more easily. In the type you show, this would be rendered more difficult. —ED.]

#### CHICKENS EAT DRONES.

I have been reading on p. 1505, of the Dec. 1st number concerning drone bees and chickens.

For a number of years I kept Black Minorca fowls. The bees used to sting them badly — so much so that when the fowls wished to cross the yard they did it by running; but the past two years I have kept Rose Comb White Leghorns. I made the change, as the Minorcas suffered so by having their combs frozen in winter. That stopped the egg production. I am pleased that I made the change; but what amused me in 1906 was that the young fowls were very fond of drones; and to catch them (the drones) on the fly, leaving or returning to the hives, the chicks would approach at the side of the hive and snap up the drones so quickly that it was quite amusing. The young fowls of 1907 have the same trick. I have seen them snap up 10 or 12 in a few minutes. I think the difference in color between black and white is the cause of the bees acting so differently with these fowls.

Woodstock, Ont.

J. B. HALL.

THE CYRENIUS METHOD OF FASTENING PAPER AROUND THE HIVE.

cord can hold the paper as close to the sides of a hive as a cleat would, but the nailing of the cleats would be objectionable. The two plans may be

# OUR HOMES

By A. I. Root

What God hath joined together, let not man put asunder.—  
MATT. 19:6.

This growing business in the way of divorces has worried and troubled me for a long time back. I am sure it is the result of misapprehension and misunderstanding; and it is Satan himself, the arch enemy of mankind, who is fostering and encouraging this uneasiness and discouragement between man and wife. This whole great world of people does not seem to realize or recognize the sacredness and the solemn responsibility that rests on the marriage ceremony. As it looks to me, there are three great events in every human life. The first is life itself, or we may call it birth—coming into this world of ours. The next great event, or perhaps the other great event, is death—the taking leave of this world and the closing up of human life. Now, we have but little to do with the matter of birth. Somebody has said we were not consulted in regard to the time or place and other circumstances. We have something to do with death, it is true; but most of us are powerless when we come to die, and, in fact, are almost as helpless as when we were born. But the third great and important event is, in my judgment, marriage. It should be regarded by both man and woman as the most sacred and solemn event that happens to them between *life* and *death*. Perhaps they do not always look at it in that way; but it is the planning and arranging for giving other human beings a glimpse of human life, through them.

A few days ago somebody sent me a little book, the title of which was, "How to Care for a Wife." All things considered, I do not know that I would want to recommend the book, especially for general reading. But there were some very good things in it. One especially was an earnest exhortation to all young people approaching maturity to consider marriage in the way I have been urging, as a sacred and solemn undertaking; that in choosing a partner for life each one should carefully consider the building-up of a home and rearing children who will be a credit to humanity and to our nation. While Mrs. Root and I were reading and discussing it, one of our daughters and her husband, and one or more of the young prattlers of their home, came in. I read an extract from the book, and asked the two young parents how many young people in contemplating marriage, or, say, during their courtship, look at the matter in that solemn and methodical way. Mr. Boyden burst out into a laugh and said, "There is not one couple in ten thousand that ever think of such things." I looked up at Mrs. Root and said, "Sue, when you and I were spending so much time together, say a year or two before our marriage, how much of an idea had we in our heads about rearing a family in the fear of God?" She laughed at the idea almost as loudly as did Mr. Boyden, and declared that she never gave even a thought to the responsibility of rearing a family. Perhaps neither one of us was ready just then for any such problem; but the dear Savior led us and taught us, and prepared us for the task, all in his own

good time, as the little strangers came into our home, sometimes a little faster than we two had planned to have them come. My attention has been called to this whole matter by an article in the *Ladies' Home Journal* for August. The title of the article is, "Why I Would Not Marry My Husband Again." Mrs. Root read a part of it to me just as I was getting ready to go to sleep; but before she got very far I raised up in bed and said with vehemence, "Sue, that article should never have been written. The *Ladies' Home Journal* made a mistake and a blunder in giving place to it. It is treason against all humanity. No wife and no husband should ever let the thought enter the head or consider for a moment such a question." Mrs. Root smiled a little at my vehemence, and a little later gave me a big smile that gave my heart a thrill when she asked very quietly, "Would you, my husband, choose the same wife if you had your life to live over again?"

She knew, bless her dear heart, what the answer would be, when I replied, before she had hardly finished her question, "Yes, to be sure I would. You know, dear old comrade and partner, that I would not trade you off for any other woman or for *all* the other women the world has to offer." Perhaps it was my turn to turn around and ask her the same question; but I knew what the answer would be, without asking. May God be praised that Satan with all his machinery and band of helpers has no power to shake or weaken in the least our love and trust in each other. But, dear friends, as I look out on the world and remember the experience of years past, I again still feel sorry that this question has ever come up. I can remember too many cases where the husband and wife did not seem to be greatly attached to each other. Some of them did not get the one they wanted, and some of them finally took up somebody else because they could not do any better. This latter course is all right. I believe in people getting married, even if they do not succeed in getting just the companion they wanted. Often death takes the loved one away. Shall the other go through life single, out of respect to the memory of the departed one? Not so. God sent us into this world to help the world along; and no person can really be in the harness, and be one of the world's efficient workers, until that person is married and has children. If God does not see fit to send the children, then let them take some of the children who have no father or mother and bring them up in the fear of the Lord.

What would you think of the woman who would go through life comparing her own husband with other men to his disadvantage, and saying to herself, "Now, if that man had been my husband I might have had some chance to amount to something. As it is, what is the use?"

Some women do have such thoughts in their mind. I have seen some so foolish that they even talked it to their neighbors. I know some wives have great trials, but so have some men; but let them remember the words of our text, and let them strive to be loyal to God and loyal to the companion God has given them. Perhaps some of you may say, "God did not do the giving. It was my own blundering when I made

the choice." That does not make any difference, my friend. You once stood up before one of God's ministering servants and took the most solemn oath ever assumed in all your life to "love, cherish, and protect." I do not know just the words you used, but doubtless you remember them. These words and this oath were not taken before the court of men. It was before the great Father above, who created us in his own image. Let me beg of you, dear friends, to believe I am speaking the truth when I declare it was the most solemn and sacred promise you ever gave to *anybody* in your life; and your happiness here on earth and in the world to come depends on how faithfully you keep this promise. For the sake of the children, the fruit of your union, if for nothing else, remember that sacred obligation and be faithful to it to the last.

Ernest and our good pastor both laughed at the idea that I objected to even the discussion of this matter as it is discussed in the *Home Journal*. They suggested that a woman may not have written it; but I claim that it is *poison* all the same, and I *am* sorry it ever came up. It is true there are some good lessons suggested in it. For instance, this husband under discussion used tobacco, and I want to make an extract from what his wife says about it:

I am perfectly willing that my husband should smoke, but in some degree of moderation. Instead of that he smokes inordinately—it is cigar after cigar, pipe after pipe, until the room is so charged with smoke that I simply can not breathe. It is not the smoke I object to so much, I think, as the absolute lack of consideration for me on his part—his unwillingness to curb a growing selfish habit in the slightest degree. His lips and his mustache invariably reek with the fumes of tobacco, and he knows that I kiss him mechanically. Why do I kiss him at all? I know no better answer to this than that he is all I have. Even with all his lacks and with a realization of all his sins against me, I am glad, I suppose, that he kisses me at all.

Now, the above is a big clip at the tobacco habit. It seems to me the man who loves his wife, especially if he is a Christian man, would give up the habit for his wife's sake if for nothing else. But suppose he does not give it up—suppose he keeps right on; is his wife excusable for saying if she had it to do over again she would marry somebody else? She is not excusable. Even the tobacco habit, much as I dislike it, is not a sufficient reason for divorce\*, nor for the mother to let even the *thought* enter her mind for an instant, that, if she had her life to live over again, she would marry somebody else. It is infidelity to the marriage vow and the marriage obligation. It is opening the door to Satan and letting him come in with other suggestions; and when he once gets a hold of a human heart there is no letting up, and finally comes separation, perhaps divorce, and oftentimes murder. How many times we have read in the papers where some man and woman have connived together to poison or put out of the way the obstacle (in the way of *husband or wife*) whose presence, let us say, prevents Satan from carrying out his plans!

Some years ago, in these very Home papers, I quoted the old proverb that "love will not go where it is sent," and I declared with all the ve-

hemence I could muster that the saying was one of Satan's falsehoods. Love *will* go where it is sent." The man or woman who has been persuaded by the Devil (for he is the one who does all this kind of work) that she does not like or love her lawful companion, can, if he or she so decides, turn about and love the one he or she is in duty bound before God to love and cherish. Dear friends, I have had some experience along this line during the years God has permitted me to live. While Mrs. Root has one of the gentlest and most lovable dispositions in the world, she has also, when circumstances bring it out, about as stubborn a disposition as any of us. Were it not so, she would not have brought up her five children and made them "toe the mark" as she has done. Well, years ago, when we did not know each other as we do now, especially before I became a Christian, there were some clashing. I remember a time when I had been praying most earnestly in regard to some differences between us; but I asked the Lord to help me, and he did lead me. The outcome of it was a complete surrender. Probably a surrender on both sides—I can not exactly remember, but she said something like this: "Dear husband, when you love me and treat me with the kindness and consideration you have shown of late, I feel as if I could go through fire and water to do any thing you wish to have me do." Then in a little while this love and kindness are reciprocated in a way that made me think, if I did not say it out loud, "Bless the dear little woman! If I too would not go through fire and water to please *her*, I should be most heartily ashamed of myself."

Just a word more in regard to this matter of love that will not go where it is sent. Dime novels and some silly poems tell us about people who have been "true to the last." Because they could not have the one they wanted they went through life on the mourners' bench. I told you about Dick Bassett up on the island near our northern home. His girl would not have him, and so he went off and lived all alone on the island for *eight years*, just for spite. Finally she relented and went to live with him on the island. When he finally got the girl his fond ambition had pictured all those eight years, according to the dime novels they ought to have lived in blissful happiness evermore; but, if I remember correctly, she very soon declared she was not going to be cooped up on that island for him or anybody else. Then they tried living on the mainland, and finally decided they could not live together comfortably anywhere. Perhaps another divorce ensued—I do not remember.

Now I hope a couple of good friends of mine will excuse me if I mention a little romance that came under my observation. May be I do not know all about it, but I guess I have the main part of it about correct.

Some fifty years ago a boy and girl who were going to school together became acquainted, and were finally engaged to be married. I think some of the parents objected because the children were too young. As usual, they had a disagreement after a time, and each one was too proud to relent, and so they separated. The young man went to a distant State, and was gone quite a spell. But after a time he felt that perhaps he was to blame, and he came back to that country

\*Much as I dislike and deplore the use of tobacco I am not sure but that, in the sight of God, this woman is more to blame than her poor husband. I mean that she is to blame for deliberately summing up his shortcomings. If Mrs. Root should set seriously about it, and make a business of compiling a list of my faults and failings, knowing me, as she does, better than anybody else in the world, I should fear for the result.

schoolhouse; but the girl had gone, nobody knew where. Perhaps she covered up her tracks for spite. He did not succeed in finding her. Perhaps he thought she might let him know where she was. Time passed, and he married somebody else in a distant land, and she also married somebody else. Both of them brought up a family; but, if I am correct about it, each of them kept looking back to that boyhood and girlhood courtship, and perhaps thought how much happier they would have been had things turned out otherwise. Now, this was all wrong. It is as wicked for the father and mother of a family to look back in that way as it was for Lot's wife to disobey Jehovah's command by "looking back." When we are once married, especially after we have had children, it is in one sense a *crime* to look back. It is treason to the partner to whom you have promised to be true. Well, now for the rest of my romance. Forty years have passed. The man lost his wife, and later the girl (or elderly woman) lost her husband. Although more than a thousand miles apart they two found out about it, corresponded, and then got together and were married. After all the years and some "heart-breaking anguish" (I wonder if I am putting it too strong) they talked over their old misunderstandings, begged each other's pardon, and stood together hand in hand. It looked as if both had become young again. I ventured a little caution. I said, in substance, "My friends, I am rejoiced to see you two happily united; but may I suggest to each one of you that you are now old people? You have both lived to see a good share of human life. You have settled down into ways and notions that are not easy to break or overcome. It will not be so easy for you to learn new things now as when you were boy and girl in that old schoolhouse. May God watch over you both, and bless and guide you."

The man had a home, and owned property in Arizona. He had lived there a great part of his life. The new wife was accustomed to a cold climate, where she had lived all of her life. When I asked how they were going to manage things she said to me, and perhaps partly in pleasantry, that, "for the sake of being with *him*, she was willing to go to the ends of the earth," etc. Well, she tried it for a little time in Arizona, where the temperature is often 110 to 112 degrees in the shade; but as she is a rather large heavy woman the desert heat seemed to be rather depressing on the romance of their honeymoon. Then he, like a good husband, came back and tried one winter in the cold climate of the North. But I fear that the zero temperature was as severe on *his* romantic ideas of early life as the desert heat was on hers; and just at present there is more than a thousand miles between them. I do not mean that there has been any *disagreement* between the two. God forbid! but when they two came to take a sensible view, as all people ought to be able to do at their age, it seemed more convenient for them to live apart than to live together.

Now, the moral I would draw from this, and from all other events of a similar nature, is that young people and sometimes middle-aged (and may be elderly ones) get a foolish notion into their heads that they "can not live" unless they

can live together. Then they soon get *another* equally foolish notion, that "they can not *live*" unless they are *separated*. A great part of this is imagination. Love *will* go where it is sent. It is your duty to love, cherish, and protect your mother as long as she lives; and this is true, even though she should not happen to be one of the most lovable mothers in the world. The same is true with the father, and with the children. God gave us our fathers and mothers, and to some he gave children. We can not escape the responsibility that God has laid upon us; and when two parties are united in the holy bonds of marriage, it should be recognized in the same way. "What God hath joined together, let not man put asunder." In conclusion I wish to make a clipping from an article in the *Medina Gazette*, being one of a series written for that paper by my good friend W. P. Root, who is just now taking down these words:

In the consideration of divorce there is one factor I have not yet alluded to; and that is, that matrimonial dividend known as the family baby. If there is one thing that should cause parents to overlook the shortcomings and misdemeanors of each other it is the helpless babe in the crib, smiling as it recognizes its father as he returns home, and then bestowing another smile, equally pleasant, on the mother who has watched it all day. If that infant has a right to its two eyes and its two feet it has an equal right to its two parents; and when I say parents I do not mean simply bearers or breeders, as the word primarily meant, but two guardians who will so nurture it as to develop the good and suppress the evil—or, rather, turn all the child's faculties into a good channel; for what are called bad traits are simply good ones perverted.

## HIGH-PRESSURE GARDENING

By A. I. Root

A STORY WITH A MORAL—DOES IT HIT YOU?

Mr. Calvert, my son-in-law, recently purchased a piece of land adjoining his home. This land had been cropped to death without proper manuring, especially at the back end of the lot; but we planted in it some field corn in order to get a start and work it up. A few days ago I was looking it over, and talking with a man after he had cultivated and hoed it. I said:

"Why, look here, Mr. Weibly, what does this mean? Here are two spots of magnificent-looking corn away ahead of all the rest. What is the reason—how does it happen?"

"Why, Mr. Root, that is where I put two wheelbarrowloads of manure that I got out of Mr. Calvert's poultry-house, and spread it around on top of the ground; and with the cultivating and hoeing, and the plenty of rain we have had, it has just rotted and is working down to the roots of the corn."

It was indeed an astonishing object-lesson, and shows that manure from the poultry-house, if properly applied, is no small asset to the business, besides the eggs and fowls for meat.

A few days later, when our folks went down to cut our beautiful piece of timothy, grown on the Clark system, I was much astonished to find two spots near Mr. Boyden's residence (another son-in-law), where there was no timothy nor any thing else. The heads of timothy around these spots were almost as high as my head. While I

was looking at the team I carelessly stepped in one of these spots, and soiled my shoes with an awful-smelling stuff that looked something like tar after it has been running out in the sun. This was not one of my "pleasant surprises" like the other. It was a rather *unpleasant* surprise. I called out again to Mr. Weibly, and said:

"Mr. W., what does this mean? What is this stuff, any way, that I have just stepped into?"

"Why, Mr. Root, I think it must be where somebody has emptied a load of poultry manure that he cleaned out of Mr. Boyden's poultry-house."

"Do you know who it was that dumped a wheelbarrow load of manure all down in one spot like this?"

"No, I do not know who did it. I suppose Mr. Boyden told one of the men to clean out the poultry-house, and did not tell him where to put it; so he just put it over on to your meadow and dumped it all in a heap, or, rather, two heaps."

Now, friends, here is a big moral. If I am correct, the trade unions undertake to pay all sorts of workmen the same wages, or something like it, and there are some who think that those who work on a *farm* should all have the same pay. The man who spread the poultry-manure on the corn ground, and worked it in, even if he was *not* told so to do, should surely have better pay than the other one who just tipped his wheelbarrow over and spilled the strong valuable manure where it killed the timothy and every thing else. This strong manure was greatly needed on the garden, that was much nearer to the poultry-house, than the timothy-field. But if he decided to put it out on the grass land, why in the world did he not scatter it around, or, better still, hunt up a place where the ground looked poor.

Now, there are just such people in this world who are looking for a job. I think that in both cases the owners of the poultry-houses were to blame for not explaining further what the man should do with the scrapings from the roosts. Perhaps Mr. Calvert did explain—I do not know. Mr. Calvert and Mr. Boyden are both exceedingly busy men. Very often they hardly have time to give directions to the man who does outdoor work. Come to think, that is generally *my* job, and I ought to have looked after both of these men. But suppose the owner of the poultry-house did *not* stop to direct what should be done with the accumulations from the poultry-houses that had been left altogether too long. The man who carefully put it where it was needed, and did good, even if he was not told, generally speaking would be worth twice as much as the one who obeyed orders and dumped the contents in "any old place" in order to get it out of sight.

There, I almost forgot the moral to my story. I guess it will be something like this: When you set a man to clean out a poultry-house, be sure to tell him what to do with the contents—to spread them out over the ground where compost is needed and where it will do the most good. And, by the way, I do not believe I would let it accumulate until there is even *one* wheelbarrowful. Years ago we made a manure-shed according to T. B. Terry's plan; in fact, he planned it out for us; but the men who have the care of our team never liked it, and said it was in their way;

it got hot, and burned in spite of all the water they put on it; and so they have, for some years past, wheeled it out under an apple-tree. Just lately I succeeded in getting them to take it from the stables direct to the manure-spreader. When it gets full it is hauled out on the meadows. Now, the *Ohio Farmer* has recently had an article wherein the writer said manure taken right from the stables and put on to the fields with a spreader is worth *six times* as much as it is where piled outdoors and allowed to be leached by the rains until it rots. It seems that six times must be an exaggeration, but it may not be, after all. It is certainly a great saving of labor to take manure right from the stables to the manure-spreader, all under cover. Now, I am satisfied that there will be a great gain in handling poultry manure in something the same way. Perhaps a small manure-spreader, made for this purpose for establishments where poultry is kept by the hundreds, might be a paying investment. In Florida our poultry roosts up in the pine-trees; but even then the manure should be carefully scraped up, say before each heavy rain, or as near to it as you can manage it. If you do not do it, it will kill the tree and spoil the ground in time for any sort of vegetation. Mr. Weibly, whom I have before quoted, assures me he has known of apple-trees being killed outright, and others nearly killed by having a poultry-house under the tree year after year. I suppose it works in the same way that those wheelbarrow loads did that killed out the timothy where they were dumped.

#### A NEW KIND OF WHEAT THAT BEARS HEADS OF GRAIN AS LARGE AS EARS OF CORN, OR SOMETHING LIKE IT.

I was astonished (and pained) to find the following, given in the reading-columns of the *Manatee River Journal*, Florida. I clipped it out and sent it to our Ohio Experiment Station.

#### MIRACLE WHEAT; NEW VARIETY PRODUCED YIELDING 277 BUSHEL OF GRAIN TO THE ACRE.

Wheat with stalks like sugar cane and yielding 277 bushels of highly nutritious kernels to the acre has been produced as a result of experiments made in Idaho by Allen Adams, of Minneapolis.

The new wheat has been named "Alaska" because of its hardness. It is either spring or winter wheat, just as the farmer desires to sow. It is so sturdy that storms that ruin other stock affect its giant stems but little, and the heads remain upright through ordinary hailstorms.

The yield shows that Adams has been able to obtain an increase of 222 fold. One head of the giant wheat was planted in the fall of 1904. The seeds from that head were planted the next year, and seven pounds of seeds obtained. This was sown in the spring of 1906, and from the seven pounds were harvested 1554 pounds that fall. In the fall of the same year he sowed it as winter wheat, but conditions were adverse. Almost all the "blue stem" and "club" were destroyed, and only a third of the crop of experimental wheat came to maturity, yet there was a yield of 50,000 pounds. A heavy hailstorm in July was the cause of the ruined wheat crop, which left scarcely any of the ordinary wheat standing.

Further experiments brought forth a yield of 277 bushels to an acre. The Idaho College of Agriculture has made a laboratory test of the wheat and reports the grain plump and sound, and that it should make better bread than does the ordinary wheat.—*Beloit Free Press*.

Here is what Professor Williams says in regard to it:

*Dear Sir:*—Prof. Green's secretary hands me your letter of the 11th inst. regarding the Miracle wheat, otherwise known as Alaska. We have received a number of inquiries within the last week or two regarding this wonder; but our knowledge of it dates back no further. On the face of it, it is, of course, a fraud of the rankest kind. Wheat that do well west of the Mississippi have never given satisfaction here; but it is open to doubt, of course, whether the Alaska gives satisfaction anywhere. I shall make

an earnest attempt to get hold of enough of it to test thoroughly among our some hundred varieties, but at present I do not know where to lay hands upon it. If you had not asked for the return of the clipping I should have liked to send it to the Idaho experiment station and note what they have to say in regard to it. Perhaps you will do so and let me know. The station is located at Moscow, Idaho.

C. G. WILLIAMS.

Wooster, Ohio, Aug. 13.

Of course we returned the clipping at once; and when our experiment stations get hold of some of the seed we shall all be happy—yes, even if we should not get *quite* 277 bushels to the acre. I give place to the whole matter here so that no one who reads GLEANINGS may be swindled by paying a great price for this new seed wheat.

*Later.*—We clip the following from the *Kansas Farmer*:

EX-GOVERNOR GLICK ON "ALASKA" WHEAT.

*Editor Kansas Farmer:*—I am pleased to see the *Kansas Farmer* expose that "Alaska" wheat scheme that certain parties are trying to work off on the farmers. This is an old fake that was worked off on the farmers of Ohio over sixty years ago. It was sold to them under the name of "Egyptian" wheat of wonderful prolificacy. Wonderful stories were told of the immense crops it would produce, and bearing three to seven heads to the stalk. Many farmers bought the wheat and sowed it, but it proved to be worthless in Ohio. If the soil and climate of that State would not produce it, I do not think Kansas soil would do any better for it.

The second sowing seemed to end its vitality. I never saw over three or four heads on a stalk, and very few of them.

My father bought enough of this wheat to sow a half-acre, and two years' trial proved it to be worthless in Ohio, and I never knew a farmer to sow it after the second trial. If any Kansas farmer pays \$5 a pound for it he can join the procession of the crowd that invested in the coreless and seedless apple.

Atchison County.

G. W. GLICK.

## POULTRY DEPARTMENT

### HOPPER FEEDING AND AUTOMATIC WATERING FOR POULTRY, ETC.

On page 848 I gave you quite a description of this, and I now give you some views of it. See cut on page 1074.

You will notice my invention is not particularly different from the great variety of atmospheric watering-devices, except that it can be hung up on the wall out of the way, and the chickens can not get on top of it nor into it. As they grow in size it can easily be hung a little higher up on a suitable nail. Since we have had such warm weather I find the devices I have been sending out are so soon emptied, especially when the fowls get to be half grown, or larger, that something larger is needed. In fact, we have them made of the largest size of wash-basin to be found in the tin-shop. Well, another thing has come to pass. During the dry weather the bees from our apiary of several hundred hives discovered the "chick-waterer" is a very handy place for them also to get water. The result is just now that the bees empty the little utensil once a day or oftener; and this has suggested to me that, by using a syrup instead of water, the little pan would make quite a handy bee-feeder. Just drive a nail in one side of the hive and there you have it. If you feed very

heavily, however, the bees might build comb at each side of the feeder.

To go back to watering chickens, however, as my flock of 75 or 80 are now mostly half grown, it takes quite a lot of water during an August day; and the very best arrangement I have ever found yet is to have running water, or, what amounts to the same thing, dripping water. Have a pipe run into the poultry-yard, with a valve on it so you can set it so the water will drip just fast enough to keep up the supply for the fowls, and have a little dish running over more or less. If you have a supply of water from the regular waterworks, or from an elevated tank for the purpose, the arrangement is then automatic. A good deal has been said about scalding and thoroughly cleaning the drinking-utensils; but where your watering-dish is all the time running over I feel quite sure that no such scalding is needed. It should be high enough up so the chickens can not scratch filth into it; and on this account a separate watering-place had better be arranged for the little chicks. Have a wire-cloth pen around it with openings just large enough to let the little ones in and out; and this same wire-cloth inclosure should also contain chick feed and wheat, where the little chicks can always get in and help themselves; and have this inclosure large enough so that the larger fowls can not by any possibility reach in and nag the little fellows when they help themselves to feed and drink. And this latter remark reminds me of a letter I have just received. It reads:

I see in the last *Practical Farmer* something about your "hopper-feed" chickens. I should like to know how your hoppers are made, both for young chickens and fowls or older chickens. I have made several kinds of hoppers, and they are not satisfactory at all. They let the food down all right, but the chickens either pull the food out with their bills or scratch it out with their feet, thus wasting it.

I like dry feeding very well; so I wish you would kindly inform me about this; and, also, if it isn't any trouble, draw an outline and give dimensions of the hopper you use, both for young and old chickens.

W. C. MERRILL.

Pocomoke City, Md.

### HOW TO MAKE A HOPPER FEEDER FOR HOPPER FEEDING CHICKENS.

Friend M., this opens up a question that has been a good deal discussed, and on which I have experimented quite a little. In a large chicken-range near Tampa, Fla., I found they used boxes of different sizes, procured at the grocery, to hold the dry mash, and, to keep the chickens from getting in, a piece of wire-cloth netting of about one-inch mesh is dropped loosely in the box. I used this quite successfully while in Florida. It is true the chickens can not scratch out the feed, but they can get in and stand in it. To prevent this, and also to keep out of the rain, we want some sort of cover, just high enough so the hens can reach up under. Each cover should be supported on a little post nailed in each corner of the box, and it should be removable to facilitate replenishing the feed. Now, this is all right so far as preventing waste, making the chickens eat it all up, and keeping out of the rain are concerned. But there is another trouble. Where you undertake to give your chickens grain enough to last them a whole week you will be sure to harbor rats and mice sooner or later. I am glad to say there are no mice in Florida—at least I never heard of any. Probably they will get around after a while, however; and I know of only one

WATERING-  
DEVICE.

way to circumvent rats and mice in hopper feeding, and that is to have your grain in some receptacle made of tin or sheet iron that is tall enough so they can not climb up or jump up the sides. A barrel would not answer, because rats and mice can climb up on the wooden hoops. Something like an extractor-can seems to answer the purpose. I do not know but an energetic rat might jump up and so get inside; but if rats did get in they would have a "picnic" in getting out again, and I do not know but it would be a good plan to use a can of such height, even if an occasional rat did get in. Then you can get a stick and give him such a scaring before you kill him that he would drive all the other rats out of the neighborhood. There is no better remedy for rats than to get a good lusty rat well cornered and make him squeal till the rest of the rats can hear him. Where a rat can not get in, of course mice will make no trouble.

We are now coming pretty close to the matter of poultry food. A great many, even farmers, are now buying mixed feed made of all sorts of grain, and this answers tiptop—very likely better than any one kind of grain alone; but, my good friends, if you will examine any of the much advertised mixed foods on the market, including ever so many brands of baby-chick food, you will find it costs quite a little more to feed your poultry that way than if you purchased the very best kind of corn, wheat, or oats, or whatever you may use. These grains in the market are sold on a very small margin, because everybody knows what a farmer gets for his crops; but where you buy a *mixture* specially put up, especially if they put in some meat scraps, grit, etc., you can not tell any thing about how much profit the mixer gets. And now here is another point: I believe our experiment stations have decided that fowls do better where they can *choose* their own "balanced ration" than where somebody mixes it for them. I would suggest that you have, say, four of the tin cans I have mentioned. Get your tinner to make them of the very cheapest brand of tin he can get. Sometimes the tinner has rusty sheets that are not fit for regular work. These will answer all right, and for corn I would have them about as large as a common barrel; for wheat, one-half or two-thirds size; but have it tall enough to keep out rats; oats, the same size as for wheat; for buckwheat, one-fourth the capacity of the largest. Now, I like better to have a receptacle for *each kind* of grain instead of putting a mixture of all in one can only. And, by the way, these deep cans make the nicest kind of hens' nests. What boy is there who can not remember finding a hen's nest in a barrel, say a barrel half full of corn, oats, or wheat?

There is just one objection to this sort of hopper. The fowls will sometimes make it foul while eating. My experience is, however, that they do not do it very often. These feed-cans must, of course, be kept under shelter. I would want a little shelter, even in Florida, when heavy storms come up. As a rule, your hens' nests should also be under shelter. If you are going to get the top notch for your eggs, they should be gathered several times a day, and no rain should ever be allowed to touch them.

Now, if somebody can improve on what I have outlined for a method of hopper feeding—one

that prevents waste, and *absolutely* heads off rats and mice, I should be glad to receive his suggestions.\*

## HEALTH NOTES

ANOTHER TESTIMONIAL FOR T. B. TERRY AND HIS TEACHINGS.

I have taken the liberty of clipping the following from a private letter from the father of our business manager, J. T. Calvert. It indicates, as you will notice, that Terry's teachings apply away up in northern Canada as well as throughout the United States.

Perhaps I should explain to you that Mr. Robert G. Calvert, another son of the writer, has just informed me that for many years his father drank tea and coffee, mostly tea, at every meal, and followed the very common (but exceedingly unwholesome) practice of taking a little sip of tea or coffee with almost every mouthful of food. You will notice by his letter that he has broken square off from this way of taking his meals. Mr. Calvert is 76 years old. And now with this preface I give you this extract from his letter:

My health was never better. I am following T. B. Terry's advice on health notes in the *Practical Farmer*. I drink about two quarts of water daily between meals, and drink nothing at my meals, and chew food well. I eat no more than three or four kinds of food at a meal; stomach and bowels are in good order.

Reaboro, Ont., Aug. 10.

JOHN CALVERT.

## TEMPERANCE

"WHEN THE PARTY GOES WRONG."

That man is a dangerous citizen who so far mistakes means for ends as to become servile in his devotion to his party, and afraid to leave it when the party goes wrong.—

Theodore Roosevelt.

May the Lord be praised that we have a President who has grace and courage enough to stand out fearlessly and courageously and give utterance to a sentiment like the above.

VOTING FOR GOOD MEN.

I want to express a hearty amen to the following, which we clip from the *National Prohibitionist* of July 9:

In the General Conference at Baltimore, Md., on the twenty-fifth day of May just past, the Methodist Episcopal Church said:

"We record our deliberate judgment that no candidate for any office, which in any way may have to do with the liquor-traffic, has a right to expect, nor ought he to receive, the support of Christian men so long as he stands committed to the liquor interests or refuses to put himself in an attitude of open hostility to the saloon."

May God be praised for the Methodist Church; and may her people continue to grow in grace and increase in numbers.

\* After the above was in type it occurred to me that the arrangement I made to head off rats and mice would not stop the English sparrow and other birds from helping themselves *ad libitum*. At present I know of no way to head off the birds but to have the grain upstairs in the little poultry-house pictured on p. 638, May 15. With the wire screen overhead so the birds can not get through, it traps them every time—that is, if they get in where the chickens do, and find their way upstairs. After they have been caught a few times in this way, so far as my experience is concerned they are effectually cured of meddling with the wheat. Somebody suggests that the amount of grain the birds get is only trifling; but it is something more than a trifle in our locality.

## FASHION BOOK FREE!

I want to send you my handsome new book showing hundreds of latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for five cts. each. They are the same patterns you have always paid the & for at the stores, made by the same people, and correct in every detail.

### HOW I DO IT.

I publish the **FARMER'S CALL**, a weekly paper for every member of the family. An especially interesting feature each week are the children's letters; and the Woman's Department is unusually strong and instructive. Among the special features for Women folks, is its fashions in which I show the **5c patterns**. Let me help you to save money.

### MY SPECIAL OFFER

Send me and I will send you the **Farmer's Call every week**

(over 1000 pages) for one year and will send my big Fashion Book to you free. I also agree to sell you any pattern you want thereafter for **5c**. I can sell them for 5 cts because I buy them by the thousand and don't make any profit. I don't want the profit. I want your subscription to the **FARMER'S CALL**. You will save many times the cost of my offer in a year. **WRITE TO-DAY!**

## TWO MONEY MAKERS

**SCARFF'S SMALL FRUITS**

and bees are an ideal combination for bee-keepers or farmers. Order early and plant a generous quantity of these fruits. The bees pollinize them, making them produce in luxurious abundance, and at the same time increase amount and value of honey.

**3 Blackberry Bushes Free.** I want to prove how well-rooted, strong and vigorous my plants are. I will send free 3 fine blackberry plants, if you write for my new 1908 free catalog. Some of my customers are making over \$350 an acre with my plants. With bees you can increase that profit considerably. I sell a large variety of nursery stock, grown on an 800 acre farm. Write me to-day.

**W. N. SCARFF, New Carlisle, Ohio**

## Read His Letter

Read of the economy and profit in this farmer's potato-digging,—how he gets every potato in the field,—how he avoids loss from scarred and crushed potatoes,—how he has made the work easy and fast.

## It Tells You how the Acme Hand Digger

### ATTACHMENT

proved out under hard, practical actual field use:

Potato Implement Co., Traverse City, Mich. Gentlemen—Two years ago I bought one of your Acme Hand Potato Diggers and after giving it a short trial in the field, my sons, who were digging the potatoes, were so pleased with the Acme Digger that I now have five in use on my farm.

The Acme is just the digger we needed. Unlike the machine diggers it digs clean, gets every potato in every hill, doesn't scar the stock, and is not bothered by the vines. The men work easily, yet quickly, and don't get so tired as with ordinary fork or hook digging.

I know from my own experience that the Acme Digger does better, easier and cheaper work than any other digger I have seen, and the best recommendation I can give anyone is that I continue to use it on my own farm.

I am, yours truly,

F. LAUTNER, Leelanau County.

**Send \$1.00 Today.** Let the Acme Attachment prove itself to you. Let it prove that your dollar is better than \$100 investment in other diggers—that it will dig potatoes better and more economically—that it is the digger you have been waiting for. Sent prepaid by express. Money returned if you had rather have it than keep the digger. Pamphlet and Potato Book free on request. Send now. Address Box 520,

Potato Implement Co., Traverse City, Mich.

## "Practice Makes Perfect."

A little girl sat on her father's lap, looking into the mirror, and inquired if God made both her father and herself. Being assured that he did she remarked that he was doing better work than he ever did before.

It is simply the old adage over again, and it is true of *The A. I. Root Co.'s* Bee-keeping Supplies; and while perfection can never be attained they are as near perfection as improved machinery and years of practice can well make them. If you have never seen them, or if you have, and have not a catalog, send at once for my 40-page catalog, illustrated profusely, and giving prices of every thing used in the apiary. *It is free for the asking.* Special price list of shipping-cases, and all kinds of honey-packages—wood, tin, and glass. Send a list of what you will need at any time and let us tell you what they will cost you delivered at your station.

*Cash or goods for wax at all times.*

## HIGHLAND FARM QUEENS

are the result of years of careful selection and judicious breeding from the best honey-gathering strains of superior long-tongue red-clover Italians in America and Italy. Highland Farm methods will produce perfectly developed, long-lived, and prolific queens. If you want bees that will winter well, build up rapidly in the spring, and roll in the honey, Highland Farm queens will produce them. We are now sending queens of this celebrated strain by return mail at the following prices:

|                                | 1      | 6      | 12      |
|--------------------------------|--------|--------|---------|
| Select untested queens . . . . | \$ .75 | \$4.00 | \$ 7.50 |
| Tested queens . . . . .        | 1.25   | 6.00   | 10.00   |
| Select tested queens . . . . . | 1.50   | 8.00   | 15.00   |

Safe delivery and satisfaction guaranteed. Send for queen circular—it tells why Highland Farm queens are superior to others. Address all orders to

**J. E. HAND, BIRMINGHAM, ERIE COUNTY, OHIO.**

## ITALIAN QUEENS

And nothing but Italians. An improved superior strain is what **QUIRIN-THE-QUEEN-BREEDER** raises. Stock is Northern-bred and hardy—not a single colony lost during the past winter; have five yards, all wintered on summer stands. Am now taking off supers of nice white-capped clover honey. Prices of bees and queens as per below:

| Prices of Queens after July 1.          | 1      | 6      | 12      |
|-----------------------------------------|--------|--------|---------|
| Select queens . . . . .                 | \$ .75 | \$4.00 | \$ 7.00 |
| Tested queens . . . . .                 | 1.00   | 5.00   | 9.00    |
| Select tested queens . . . . .          | 1.50   | 8.00   | 15.00   |
| Breeders . . . . .                      | 3.00   | 15.00  |         |
| Straight five-band breeders . . . . .   | 5.00   |        |         |
| Two-comb nuclei, no queen . . . . .     | 2.25   | 12.00  | 22.00   |
| Three-comb nuclei, no queen . . . . .   | 3.25   | 18.00  | 32.00   |
| Full colonies on eight frames . . . . . | 5.00   | 25.00  |         |

All queens now go by return mail. Safe arrival and pure mating guaranteed. We employ 400 to 500 swarms. Can furnish bees on L. or Danz. frames. Add price of whatever queen is wanted to nuclei or colony. No order too large, and none too small. Over 20 years a queen-breeder. Address all orders to

**QUIRIN-THE-QUEEN-BREEDER, Bellevue, Ohio.**

## GOLDEN-ALL-OVER and RED-CLOVER ITALIAN QUEENS

My stock is the result of years of careful selection, and is equal to any in the country. The prices are only such as to insure long-lived, prolific queens, whose workers will be hardy and good honey-gatherers. Write for 1908 circular. **PRICES.**

|                                                  | 1      | 6      | 12     |
|--------------------------------------------------|--------|--------|--------|
| Untested . . . . .                               | \$1.00 | \$5.00 | \$9.00 |
| Select untested . . . . .                        | 1.25   | 6.50   | 12.00  |
| Tested, \$1.75 each; select tested, \$2.00 each. |        |        |        |

Positively all orders filled in rotation.

**Wm. A. Shuff, 4426 Osage Ave., Phillade phla Pa**

## CARNIOLAN, BANAT, AND CAUCASIAN QUEENS

Home-bred, \$1.00 each; five at 80c each; Imported, \$4.00 each.

**FRANK BENTON, - Box 17, - WASHINGTON, D. C.**

## ITALIAN QUEENS

Fine young prolific 3 and 5 banded Italian queen, untested, only 75c; extra-fine queen \$1; tested, \$1.25. Full colonies in 8-fr. hive, with queen, \$5.50; 3-fr. nucleus, with queen, \$2.75. Safe arrival guaranteed. Directions to introduce go with queen. Price list free.

**J. L. FAJEN, ALMA, MO.**

## SOMETHING EXTRA FINE IN QUEEN BEES

They are daughters of a Doolittle queen mated to drones of the Moore strain. By the use of all worker comb and drone-traps on Doolittle colonies no drones are allowed to fly but those of the Moore strain. This strain is the finest for honey-gathering I ever reared, and they always reproduce themselves.

Queens of the above strain, \$2.00 each. Breeding queens, \$3.00. Breeding queens one year old, with honey record, \$5.00 and \$7.00; queens of the Moore strain, \$1.00. I guarantee safe arrival and a well-pleased customer!

**W. M. PARRISH**

**Lawrence, Kan.**

**Rt. 8**

**COVERT, KAN., July 30, 1908.**  
**W. M. Parrish:** That 1906 queen is still ahead this season. The queen I bought of you last year has done well. She heads a colony that has not yet swarmed, and they have made more than double the usual average per colony. Your bees are hustlers. **CLARENCE A. HALL.**

## Italian Queens

**GOLDEN AND CLOVER STOCK.**

Choice queens, 75 cts. each; six for \$4.00, or \$7.50 a dozen  
**GEO. W. BARNES, Box 340, Norwalk, O.**

## Golden Italian Queens, 75c

**Six for \$4.00.**

Mailed promptly. Safe arrival and satisfaction guaranteed.  
Circular.

**J. B. CASE, . . . . . Port Orange, Fla.**

## Westwood Red-clover Queens

Are the bees that got the honey in 1907.

Better try them for 1908. Nuclei and full colonies a specialty. Price list on application.

**HENRY SHAFFER, 2860 Harrison Ave., Sta. L, Cincinnati, O**

## QUEENS of MOORE'S STRAIN OF ITALIANS

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the *Bee-keeper's Review*, Flint, Mich., says, "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

Prices: Untested queens, 75 cts. each; six, \$4.00; doz., \$7.50. Select untested, \$1.00 each; six, \$5.00; doz., \$9.00. I am filling orders by return mail.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

**J. P. Moore, queen-breeder, Rt. 1, Morgan, Ky**

## Queens

**Golden and  
three-banded.**

Wurth's queens take the lead everywhere; have 600 queens; can send by return mail; untested, 60 cts. each. Send for circular.

**DANIEL WURTH, Rt 3, Fayetteville, Ark.**

## Taylor's Strain of Italians IS THE BEST.

Long tongues and goldens are the best of honey-gatherers; 19 years a specialty, breeding for the best honey-gatherers. Untested, 75 cts. each, or \$8.00 a dozen; tested, \$1.00 each, or \$10.00 a dozen; select tested, \$1.50 each. Breeders, the very best, from \$3.00 to \$5.00 each. We sell nuclei in full colonies. Bees in separate yards. Safe arrival guaranteed. Send all orders to

**J. W. TAYLOR & SON, Beeville, Bee County, Texas.**

## RED-CLOVER QUEENS

200 lbs. honey from my breeding colony. Mostly red-clover honey. Untested queen, 75 cts.; tested, \$1.00; doz., \$7.00. Four-frame nuclei and fine tested queen, \$4. G. Routzahn, Biglerville, Pa.

CHOICE

## QUEENS

ITALIANS AND CARNIOLANS.

1 untested, 75c; 12, \$7.50. 1 tested, \$1.00; 12, \$11.00.  
1 selected tested, \$2.00. 1 breeder, \$3.00.

Nuclei, full colonies, and bees by the pound at low prices.

**CHAS. KOEPPEN, Fredericksburg, Va.**

## DOOLITTLE & CLARK

Are sending out fine Italian queens at the following prices: Untested, \$1; 3, \$2.50; 12, \$9.00. Tested, \$2.00; 3, \$5.00; 12, \$18.00. Breeders, \$2.50, \$5.00, and \$10.00. Send for circular.

**BORODINO, ONONDAGA CO., N. Y.**

Long-tongued

## Red-clover Queens

Bred by their Originator

Do you want to get some specimen queens of the world-famous red-clover stock of Italian bees? Then buy from me, because I am the originator, and surely ought to know how to breed them in their purity. When you get them from me you know you have the real strain. For years I have devoted time and skill to this stock, trying to reach perfection. I can submit many splendid testimonials in favor of this stock to show my work has not been in vain. Try them, and YOU will be pleased also. I endeavor to please the practical man looking for definite results in dollars and cents. Many years' experience as head apiarist of The A. I. Root Co. enables me to fill the most exacting order with complete satisfaction to the purchaser. Let me show you how well I can please you.

### Prices

|                        | June to October, | \$1 00 |

### Honey and Wax for Sale

**FOR SALE.**—"Gilt-edge" clover and raspberry honey at \$10.75 per 120-lb. case. N. B. K. A. new round cans (best package made), filled with Wisconsin's finest basswood honey at \$5.50 each. This honey remained sealed on the shelves for weeks after the honey-flow, and is the most delicious, perfectly ripened article that can be produced at any price. Order to-day; and if you are not absolutely satisfied with this honey I will refund your money without asking any questions. Almost every sample sent this season has brought me an order. What pleases others will please you; therefore I do not charge for samples. If you appreciate a superior product at a reasonable price, let me hear from you.  
F. B. CAVANAGH, Boscobel, Wis.

**FOR SALE.**—To reduce stock I offer for sale as follows: 27 cases No. 40, and 44 cases No. 43 at \$10.80 per case of two 60-lb. (new) cans. This is a raspberry-basswood blend, and is the cream of two apiaries, being extracted from select all-sealed-upper stories. The partly full upper stories are being extracted by themselves (No. 38), and sold at a less price. Money can not buy better honey than lots No. 40 and 44. The above honey was gathered during June and the first half of July, and was extracted the week beginning Aug. 10. This "left-on-the-hive-all-summer" honey is sappy, rich, ripe. A free sample will convince you. Other lots at a less price; also a little comb honey left.  
E. D. TOWNSEND, Remus, Mich.

**FOR SALE.**—150 cases of No. 1 comb honey, 15 sections in 3-inch glass, no-drip cases, 6 cases in a crate, very fine, at \$2.00 per case, f. o. b. cars here. Also 8000 lbs. clover and basswood extracted, in new 60-lb. cans, 2 in case, very heavy body and fine flavor, at 8c, f. o. b. cars here. Sample free. Also extracted in 1-lb. Simplex jars, at \$2.00 per dozen.  
W. H. TOWNSEND, Hubbardston, Mich.

**FOR SALE.**—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 9 c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order.  
LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

**FOR SALE.**—Aug. 16 we finished taking off our clover, basswood, and button-willow honey. It is principally clover, fine and rich. Delivered at station in 60-lb. square cans, two cans to case; 8½ cts. per lb. Reference, our postmaster or agent, Lakeville, St. Joseph Co., Ind., at which place address C. A. BUNCH.

**FOR SALE.**—New crop of fancy white-clover extracted honey, thoroughly ripened on the hives before extracting. None of better quality on the market. Put up in barrels, new 60-lb. tin cans, and smaller packages if desired. For prices, etc., address  
EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

**FOR SALE.**—5000 lbs. of clover and amber honey in 160-lb. kegs.  
C. J. BALDRIDGE, Homestead Farm, Kendaia, N. Y.

**FOR SALE.**—5 tons of fine-quality comb and extracted. State amount you wish, and we will quote you our lowest cash price.  
QUIRIN-THE-QUEEN-BREEDER, Bellevue, O.

**FOR SALE.**—Choice white extracted honey, mostly clover and raspberry mixed, in new 60-lb. cans. Price on application. Sample, 10 cts.  
JAMES McNEILL, Hudson, N. Y.

**FOR SALE.**—Fancy clover extracted honey in new cans, two in a case. Send 10 cts. for sample, which may be deducted from first order.  
EARL RULISON, Rt. 1, Amsterdam, N. Y.

**FOR SALE.**—Write for prices on clover, basswood, and buckwheat honey in 60-lb. cans and kegs; also comb honey and beeswax, all guaranteed to be pure.  
W. L. COGGSHALL, Grooten, N. Y.

**FOR SALE.**—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.  
J. P. MOORE, Queen-breeder, Morgan Ky.

**FOR SALE.**—I have 12,000 lbs. of fancy white-clover comb honey, put up in no-drip shipping-cases, crated for sale.

R. A. ELLISTON, Princeton, Ill., Rt. 5.

**FOR SALE.**—600 lbs. choice white-clover honey in 60-lb. cans.  
R. HILLMAN, 1225 E. Eighth St., Brooklyn, N. Y.

**FOR SALE.**—White-clover honey of the finest quality, in new cans, boxed single, and holding 58 lbs. net each. Price per can, \$5.50. Postpaid sample, 6 cts.  
R. & E. C. PORTER, The Bee-escape Folks, Lewistown, Ill.

**WANTED.**—Fancy-white clover honey, comb and extracted.  
BARRACKMAN & ROWE, Decatur, Ill., Rt. 2.

**FOR SALE.**—Carload of alfalfa honey in 5-gallon square cans.  
WM. MCKIBBEN, Ontario, Ore.

**FOR SALE.**—Honey, clover, or buckwheat, comb or extracted. Write for price. Sample of clover extracted free. State quantity and quality desired.  
C. B. HOWARD, Romulus, N. Y.

**FOR SALE.**—Choice extracted clover honey for table use, in new square cans.  
C. F. LUFT, Ada, Ohio.

### Honey and Wax Wanted

**WANTED.**—25 tons of fancy comb honey. Write, stating particulars, to C. M. CHURCH, New Kensington, Pa.

**WANTED.**—Comb, extracted honey, and beeswax. State price, kind, and quantity.  
R. A. BURNETT, 199 South Water Street, Chicago, Ill.

**WANTED.**—Comb and extracted honey, any quantity. Alfalfa clover preferred.  
THE FRISBEE HONEY CO.,  
Box 1014, Denver, Colo.

Mail small sample, giving quantity you have, how put up, and lowest cash price you will take for it.  
E. R. PAHL & Co., Milwaukee, Wis.

**WANTED.**—We are in the market for No. 1 white extracted honey in any quantity. Correspondence solicited. State kind, quantity, and price asked. We also have for sale 60-lb. honey-cans, 2 cans in case. Both cans and cases in A1 condition, at 30 cts. per case.  
MICHIGAN WHITE CLOVER HONEY CO.,  
31-33 Griswold St., Detroit, Mich.

### Real Estate for Bee-keepers

**FOR SALE.**—Farm of 14 acres near city of 20,000; good soil, market, and bee pasture.  
L. C. HOOK, Richmond, Ind., Rt. 3.

**FOR SALE.**—Fruit and vegetable farm; poultry and bees; healthy location; price \$3500.  
R. ADDISON, Loughman, Fla.

**FOR SALE.**—A good paying bee business in Minnesota; with or without real estate; 400 colonies Italian bees, with all necessary up-to-date appliances.  
A B C, care A. I. ROOT Co., Medina, Ohio.

**FOR SALE OR RENT.**—Bee-hive factory; waterpower, 85-horse capacity; trackage, yardage, 93,000 feet floor-space. Native basswood for sections can be bought for \$3.00 to \$5.00 per cord. Thick soft white pine for hives available at less than Eastern price. If interested, come.  
W. H. PUTNAM, River Falls, Wis.

Breeding queens of pure Caucasian and Carniolan races—price \$3.00. Order from A. E. Titoff, Expert in Apiculture, with Russian Department of Agriculture, Kiev, Russia. Remit with orders. Correspondence in English.

#### HANGER-CLEATS IN DANZ. HIVES AND SUPERS.

Instead of the usual hanger-cleat for Danz. brood-chambers and supers made  $3\frac{3}{8}$  wide and  $\frac{1}{8}$  thick we are planning to furnish a cleat  $\frac{3}{8}$  inch square let into a groove  $\frac{1}{8}$  deep inside of the end of supers and bodies, as a support for frames and section-holders. This will leave  $\frac{3}{8}$  inch space between frames or section-holder and end of hive or super above and below this cleat. As the bees have not bothered building bits of comb in this space above the hanger-cleat in the past, we do not believe they will do so below the cleat. Considerable material is saved, and the narrower support will facilitate the easy handling of frames and section-holders. If any one fears the result of so much space, a piece 3 inches wide by  $\frac{3}{4}$  inch thick could be nailed in below the cleat, reducing the bee-space to  $\frac{3}{8}$  inch, and adding that much to the thickness of the end of the super or hive-body.

#### UNTESTED QUEENS.

We desire again to call attention to the fact that the past season was exceptionally favorable to the production of high-class queens, both as regards quality and quantity. For this reason we believe this presents a golden opportunity for many bee-keepers whose queens are failing from old age or hard work. By inserting a young queen in place of an old one we secure a sort of insurance for next year. A young queen winters better, commences to lay earlier, and is less likely to swarm next breeding season. Moreover, there is always a probability of an old queen dying at a very inconvenient season when queens are very difficult to procure. Just at present queens can be bought for little money and may be introduced easily because the supers are off in most apiaries. We have a large stock of untested queens ready to mail, so there will be no delay; in fact, will ship by return mail when so ordered. Price of one queen, \$1.00; six, \$5.00; twelve, \$10.00. Prices quoted on lots of 50 or 100.

#### DISCOUNTS FOR EARLY CASH ORDERS.

As usual at this season of the year we are prepared to reward those forebanded people who not only have faith in the future but who can tell before their bees begin to swarm in the spring something near what they are likely to need for the coming season—people who like to avoid the worry of delay in the hands of the transportation companies or excessive express charges on goods ordered the last minute because they can not wait for freight to arrive—people who prefer to take leisure time during winter to prepare the supplies for use the coming season. After such a bountiful honey crop as has been gathered in most sections the past season there ought to be a much larger number than usual who will take advantage of the liberal early-order discounts which we are offering for out-of-season cash orders. On all orders accompanied by cash received during the month of September, and subject to conditions named below, we allow 7 per cent discount.

On October cash orders we allow 6 per cent discount.

|              |     |       |     |
|--------------|-----|-------|-----|
| " November " | " " | " 5 " | " " |
| " December " | " " | " 4 " | " " |
| " January "  | " " | " 3 " | " " |
| " February " | " " | " 2 " | " " |
| " March "    | " " | " 1 " | " " |

This discount will apply on all articles listed in our regular catalog at current corrected prices to date except as follows:

Tinned wire, paint, Bingham smokers, Porter bee-escapes, glass and tin honey-packages, scales, bees and queens, bee books, papers, labels, printed matter, bushel boxes, seeds, and specialties not listed in our general catalog. Where any or all of these articles in a general order do not exceed fifteen per cent of the whole order the discount may be deducted from the whole order, including these items which are otherwise excepted.

#### CHANGES IN SUPPLIES FOR THE SEASON OF 1908-'9.

In addition to the changes in our honey-extractors already announced, with the increase in price made necessary by the improvements, we desire to call attention to some further changes in styles and prices.

On another page we show an improved shipping-case with sliding cover and corrugated paper in bottom in place of drip-sticks. In connection with these improvements we propose to make the width of our cases for  $4\frac{1}{2}$  sections just right for the standard  $1\frac{1}{2}$  beeway section instead of making them, as heretofore, wide enough for a 2-inch section. The great bulk of beeway sections used are  $1\frac{1}{2}$  wide, and the standard case should fit that section. Those desiring cases for other widths should have them cut to order. For 24 sections,  $4\frac{1}{2} \times 1\frac{1}{2}$ , the case will be  $11\frac{1}{2}$  inches, 4 row; for 24 sections,  $4\frac{1}{2} \times 1\frac{1}{2}$ , or 20 sections  $4\frac{1}{2} \times 1\frac{1}{2}$ , the case will be  $9\frac{3}{4}$  inches, 4-row. The 12 and 10 inch 2-row cases will be likewise reduced to  $11\frac{1}{2}$  and  $9\frac{3}{4}$ . The slide-cover cases with corrugated packers for bottom will be one cent each more than the regular old-style case for the present. Eventually we hope to have but the one style at regular price.

There has been a growing demand for a hive-bottom  $\frac{3}{8}$  inch thick instead of  $\frac{1}{2}$ , and we plan to make the  $\frac{3}{8}$ -inch the standard for the coming season. Until stock in dealers' hands has been disposed of, orders may be filled with either style unless the one ordering states a preference with his order.

## SPECIAL NOTICES

### BY OUR BUSINESS MANAGER

#### WHITE SWEET-CLOVER SEED.

We have not yet secured enough white sweet-clover seed to supply our needs for the coming year. As this is the time for gathering it, we would be pleased to hear from those who have gathered, or can gather, seed which they have not sold. If gathered, mail sample, stating quantity you can furnish, whether hulled or unhulled. We have already contracted enough seed of the yellow variety.

#### HONEY WANTED.

Notwithstanding the good crop of honey secured in most localities we have secured very little so far. We are getting numerous inquiries, and do not have the honey at hand to supply them. We would be pleased to get samples by mail, of extracted clover honey, with offers stating quantity and how packed. Write us, also with offers on choice comb honey, stating how packed, quantity, and grade, and the price asked.

There have been so few calls for the double-air-spaced paper-covered cover that we expect to drop it out of the list. This is a most excellent cover, but it is a lot of work to put it together properly. Even if not listed, most dealers will be able to furnish those who prefer it from stock on hand. The price of brood-frames will be advanced a little. Hoffman frames will be \$2.90 per 100; thick-top staple-spaced frames, \$2.70 per 100; metal-spaced frames, \$3.40 per 100; Danzenbaker frames, \$2.70 per 100; shallow Danzenbaker frames, \$2.50 per 100.

We do not change the single and five rate on hives and parts of hives; but larger quantities will be advanced over the rates formerly made, making a smaller difference in price between 5 and 10 and between 10 and 25.

Enamel cloth is advanced to 30 cts. per yard; \$3.00 per piece of 12 yards.

Observation hives, nailed and varnished, will be increased in price to \$9.00 for 8-frame complete; \$8.50 without frames; supers complete, \$3.25; hive without super, \$6.00. Brood-chamber complete, \$4.50; the same without frames, \$4.00. We are making an improved style of one-frame observation hive with movable side panel, similar to the large size. Price, without super, \$3.00; with super, \$3.50. We find by our factory-cost system that, having spared no pains or expense in getting these first class in every respect, we have been selling them less than cost; therefore we are obliged to advance prices as noted.

## Special Notices by A. I. Root

Has your town settled the "wet and dry" question?

THE WRIGHT BROTHERS AND THEIR FLYING MACHINE, NOT ONLY "OUT IN THE OPEN" BUT "UP IN THE AIR."

While your eyes rest on these words the probabilities are that the Wright Brothers will be "up in the air," both in Europe and America. For the first time they permit photographs to be taken of the entire machine. We have space just now to quote only the following (in regard to Wilbur Wright in France) from the *Chicago Daily News*:

"On a carpenter's table in the shed are vases of fading flowers brought by women admirers from gardens near the sea. There, several unopened bottles of dry champagne share space with copper wire, a lathe, wrenches, a roll of canvas. All will be used but the champagne, for Wright, who does no stroke of work on Sunday, touches neither alcohol nor tobacco."

May God grant that no untoward accident may happen to these two intrepid brothers who not only have the eyes of the mechanical world directed toward them, but who are setting such a good example in the way of morals before the young inventors of the world, as is indicated by the above newspaper clipping. See the daily paper and magazines for an account of their doings.

### "MIRACLE" WHEAT.

Since page 1016 of this issue was printed we see that the *Saturday Evening Post*, of Philadelphia, in its issue for August 15, has given a full page, with stunning illustrations, in regard to this wonderful wheat. The *Obio Farmer*, in commenting on it, says, "No one but a fool or a swindler will announce a new kind of wheat guaranteed to produce 200 bushels to the acre under average conditions." The *Farm and Fireside* and other agricultural periodicals are turning in to show up this gigantic swindle. Meanwhile the public would like to know whether the *Evening Post* (and other periodicals that have been giving prominence to such schemes) is a "fool" or in the "swindling" business.

Still later,—To-day, August 29, just as we go to press we find that a representative of the *Spokane Review*, of Spokane, Washington, has hunted up this celebrated man, Abraham Adams, of Juliaette; and while they could get nothing very definite from Mr. Adams himself, the men who thrashed his wheat gave figures to the effect that his yield was about 20 bushels to the acre. How does that sound, compared with 222 bushels, and the other statements in the *Manatee River Journal*, the *Saturday Evening Post*, and *Judicious Advertising*.

### RATS AND MICE—A LITTLE MORE ABOUT THEM.

On reading over the matter on page 1018 I notice I have not yet considered a hopper feeder for small chickens that will keep out rats and mice. In fact, so far as I can see, it is a hard question to solve. The small chickens can not get into the cans I have described, and just now I do not see how we can arrange any sort of apparatus that will admit small chickens and yet keep out rats and mice. When we come right down to it, there should be no rats and mice in the neighborhood. There are none in our neighborhood at the present time; but I am expecting every day to find them around. Quite small chickens will soon learn to go upstairs in that little poultry-house; and this arrangement heads off the sparrows and as yet offers some discouragement to rats and mice, but probably not very long. As I have said before

several times, if you persistently fight rats and mice, and keep right at it day after day and week after week, they will very soon decide, evidently, that yours is an unhealthy locality for rodents. If any of our readers can explain to me how a hopper feeder can be arranged for small chickens, and yet be mouse and rat proof, I should be glad to be informed.

## KIND WORDS.

The A. I. Root Co., Medina, Ohio—Gentlemen:—

I received of you to day ten queens in fine order. Only one dead bee in all the cages. The queens are fine-looking ones. Thanks for promptness. F. GREINER.

Naples, N. Y., Aug. 18.

The shipment of nuclei arrived in good condition. I transferred them at 4 A.M. on Thursday, and by sunrise they began to get busy. I am greatly pleased, as I find they are beautiful and gentle, and they are certainly good workers. In short, it is just what I wanted. FRANK ZIEGLER.

Rochester, N. Y., May 24.

We received the five queens in fine condition, with no dead or feeble bees in the lot. Many thanks. C. C. THOMAS.

Riverside, Cal., Aug. 15.

The forty queens were all received in fine condition, and, so far as I have noticed, all have turned out well with the exception of one, which turned out to be a drone-layer. I lost but one of the forty queens in introducing. PETER RIESTER.

Auburn, N. Y., July 10.

The five frames I received last week arrived in fine order, and are working finely. They are the gentlest bees I have ever handled, and I do not need any smoker or veil with them. Thanks for your prompt shipment. C. F. CARPENTER.

Bay St. Louis, Miss.

The queen arrived all right in fine order. Many thanks for your prompt shipment. MRS. W. H. SARVEY.

Clarion, Pa., May 11, 1908.

The red-clover bees which you sent me last August are doing very well. I never saw gentler bees than they are, and they are good workers. I can handle them without any smoke, veil, or gloves. They will not leave the frames. G. M. SEIFERT.

Northampton Heights, Pa., July 7.

The nucleus came promptly in good condition. The queen is all right and is now laying. I was certainly "beat" when I came to handle them. I can roll up my sleeves and, without a veil, open the hive and take the bees off my hands without getting a sting. I call those pretty tame bees.

Belden, O., Aug. 11.

MERTON E. GRAHAM.

## Convention Notices.

Bee-keepers in Alabama, Florida, Georgia, Mississippi, and Tennessee, also points along the route, who will join the party of a carload to attend the National Convention at Detroit, Mich., Oct. 13—15, will please write us for rates, etc. This promises to be the best convention yet, and is to your interest to attend. Elamville, Ala. WM. S. MCKNIGHT.

The annual meeting of the Kansas State Bee-keepers' Association will be held at Hutchinson, Sept. 16, 10. The first session will be held at 2:30 on the 16th. This meeting occurs during the State fair, and it is hoped that a large number of bee-keepers will be present. Several noted bee-keepers from different parts of the country have promised to attend.

Topeka, Kan.

O. A. KEENE, Sec.

HAS DEALT WITH ONE HONEY FIRM FOR OVER 30 YEARS.

It is not often that we put in a free ad. for any honey-dealer; but the firm of R. A. Burnett & Co., of Chicago, has left such a good record that we think we are safe in publishing a letter that was sent to that firm recently, especially as the writer puts himself entirely in the hands of the firm to do the best thing possible for him. The letter is as follows.—Ed.]

R. A. Burnett & Co.—I have this day sent to you by freight 58 cases of extracted white-clover honey, 120 lbs. of honey net in each case. Please close out the honey as soon as possible, as I am in need of the money. Your firm has handled my honey for over 30 years. F. W. HOLMES.

Coopersville, Mich., July 25.

ASHLAND PUMP AND HAY TOOL WORKS

# Four Great Special Numbers

SEPTEMBER, OCTOBER, NOVEMBER, and DECEMBER, 1908

**A second great enlargement and improvement.** With the June issue The Guide to Nature commenced its second era (of three months) with so many improvements as to surprise delightfully every patron. Beginning with the September number there is another decided advance, and the numbers for September, October, November, and December will eclipse all previous efforts in value and interest to readers.

There is to be a new and beautiful cover, and many other mechanical improvements. We have in hand and there are promised a large number of interesting articles and expressive photographs. Several new features which we are not yet free to announce are in preparation. The September number will surprise and delight.

It has taken a few months to "find ourselves." But we can tolerate the delay in the satisfaction that we are doing the "finding." It takes a little time to get under full headway. By the September issue we shall have had that time.

The magazine just as it is in June, July, and August is of higher grade than any other nature magazine ever published. It fits the present increasing interest. We have full confidence that those who know the magazine agree with that statement.

Neither the Prospectus nor any form of announcement can fully portray the merits of the magazine. We ask a fair trial and your hearty co-operation. Let the magazine speak for itself, and let us have the benefit of your suggestions and criticisms.

Single copy—15c. One year—\$1.50. Less than one year at single-copy rates, with the exception that, to new subscribers only, is offered a four months' trial for 50c.

# One-Color Honey-Labels

Gross Weight ..... Lbs. .... Oz.

Case Weighs ..... Lbs. .... Oz.

Honey Weighs ..... Lbs. .... Oz.

No. 60.—250, 25c; 500, 40c; 1000, 75c; gummed.  
If wording is changed same price as No. 62.

**Take Notice!** This honey will candy or become white and hard, as soon as it becomes cool, or cool weather begins, and this candying is, in fact, the best proof of its purity. To restore it to the liquid form, set it in hot water, not hotter than you can bear your hand in. To over-heat or boil the honey spoils the flavor. When melted, remove and cork or cover again. If sealed up while quite hot with a cork dipped in melted wax [or with the inside of the cover waxed], it will usually not candy again. When putting the bottles in hot water place them on strips of wood to prevent breaking.

No. 61.—250, 25c; 500, 40c; 1000, 75c; gummed.  
If wording is changed same price as No. 62.

**TAKE NOTICE.**—As manufactured adulterated honey can not be made to imitate the granulation or "candying" of pure honey, granulation has been found to be the only ready test of pure honey. I therefore do not ship extracted honey before it is thoroughly granulated by cold weather: I WARRANT every pound of honey put up and shipped by me to be absolutely pure honey as collected from the blossoms by the bees. To restore to the liquid form and retain its original honey flavor, set the can in warm water and remove cover, but do not heat honey to boiling point. Let cool before using.  
P. W. STOWELL, Otsego, Michigan.

No. 62.—250, 45c; 500, 65c; 1000, 90c; ungummed; wording changed to suit

Remember prices elsewhere which are even now high, are bound to rise. We can quote you 30 to 60 per cent better prices for the same lumber than your local dealer. We guarantee every carload to be exactly as represented. Closest inspection of our lumber stock invited.

Call at our warehouse and yards at Chicago and see the lumber we are offering and you will recognize that it is all we say of it. Make your own selection and see if loaded. It is not necessary to come to Chicago, however, unless you wish to. We can fill your order by mail with just what you want and guarantee you absolute satisfaction. Ours is the largest direct to the

consumer lumber headquarters in the world. We sell millions of feet annually. Orders filled from every part of the United States. No matter where you live you can save money by supplying your building wants here.

We do not figure fancy prices, but quote figures that command your patronage. Whether your order is large or small we can save you money on it. Our tremendous business of millions of dollars annually is your best guarantee of complete satisfaction of every purchase made from us. In our enormous stock of new lumber of every kind we have just what you need for every purpose. Don't buy a stick of material until you get our prices. We offer you everything in the lumber and building supply line needed for residences, farm homes, stores, churches, barns, outbuildings of every kind, sidewalks and fencing. In short any kind of a structure requiring lumber, at from 30 to 60 per cent less than your local dealers or lumber yards ask for it.

**IMPORTANT! Send Us Your Lumber Bill For Our Estimate**

Make up a list of what you need. Send it to us for our price. If you are putting up a building of any kind whatsoever let us figure with you. Our prices talk louder than words. Have your carpenter or contractor send us your list of what is needed if he has charge of your building. Don't pay exorbitant prices to the lumber trust with their long line of lumber yards all over the country. Don't let the local dealer soak you with his heavy profit. Remember: Chicago House Wrecking Company buys millions of feet at a time under circumstances of forced sales which means sacrificed prices and enables us to sell even as low as cost without loss. You take no chances in dealing with the Chicago House Wrecking Company. Whether for \$1 or \$10,000 your order will be filled carefully. Our lumber and supplies are guaranteed exactly as represented. If you have no need for a whole carload yourself get your neighbors to club in with you. By buying a carload you can save all kinds of money on freight charges.

We have railroad trains running through our main warehouses and buildings and can load a car to good advantage to you. You can include in this same car, pipe, plumbing material, roofing, wire, fencing, furniture, hardware and merchandise of every kind.

We also furnish you building and barn plans absolutely free upon request. Write us for any information or advice you want and we will have our staff of architects answer every inquiry promptly. Our free book of plans is sent if you mention this paper. We simplify your building proposition.

Our business demands quick action. We must keep our stocks moving. This means prompt shipment—no annoying delays. Let us help you lay out your plans. We will relieve you of every detail. That is what our Special Builder Service is for. Be sure and send us your lumber bill for our estimate. Feel free to write for anything you want to know along the line of building supplies, furnishings, etc.

**WE PURCHASE OUR GOODS AT Sheriffs' and Receivers' Sales**

## Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

### EASTERN GRADING-RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

### NEW COMB-HONEY GRADING-RULES ADOPTED BY THE COLORADO STATE BEE-KEEPERS' ASSOCIATION.

**No. 1 WHITE.**—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 1 LIGHT AMBER.**—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separated honey to average 21 pounds net per case of 24 sections; no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 2.**—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separated honey to average not less than 19 pounds net.

Cases of half-separated honey to average not less than 20 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 21 pounds net per case of 24 sections.

**ZANESVILLE.**—Honey continues to move rather slowly, due to the general business stagnation. Producers seem to be holding for higher prices than the condition of the market warrants. No. 1 fancy comb brings wholesale 17 to 18; extracted, 10. Beeswax brings on arrival 28 cts. cash or 30 in exchange for bee supplies.

EDMUND W. PEIRCE, Zanesville, O.

Sept. 8.

**INDIANAPOLIS.**—The demand for the best grades of honey is good. Producers are offering fancy white comb honey at 12½; No. 1 white at 12; white-clover extracted, in five-gallon cans, at 7; very little demand for amber at any price. Many bee-keepers seem to be holding their honey for higher prices. Beeswax is steady at 28 cts. cash, or 30 in exchange for merchandise.

Sept. 5.

WALTER S. POWDER, Indianapolis.

**SAN FRANCISCO.**—Small lots of honey are still coming into the market, and the better grades of comb and extracted find a ready market at former prices. Low grades, while dull, are also well sustained in value. Packers are paying 5½ to 6½ for extracted, and 11 to 13 for comb, while stock in this market moves at the prices quoted: Water-white comb, 16 to 17; white, 15; Water-white extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 5½ to 5¾; candied, 5¼ to 5½. —*Pacific Rural Press*, Sept. 5.

**KANSAS CITY.**—The receipts of comb honey are light; in fact, our demands are heavier than our receipts. The receipts of extracted are light—demand fair. We quote No. 1 comb honey, white, 24-section cases, \$3.25; amber, \$2.75 to \$3.00; extracted, white, 7½ to 8; amber, 7 to 7½; beeswax, 28.

C. C. CLEMONS & Co.,  
Kansas City, Mo.

Sept. 3.

**CHICAGO.**—We quote our market to-day on comb and extracted honey as follows: Fancy white-clover comb honey (24-section no-drip flat cases) 16; No. 1 white, same as above, 14 to 15; No. 2 white and light amber, 11 to 13; extracted white clover, in 60-lb. cans, 7½ to 8; the same in barrels, 7 to 7½. Beeswax, choice and pure, 28 to 30.

Certainly you understand that, with heavier arrivals of comb and extracted honey, we do not expect to see the above prices sustained, and it behooves you to get your honey on the market as early as possible, to take advantage of present prices.

Aug. 20.

S. T. FISH & Co.

**CINCINNATI.**—The marked decrease in the demand and consumption of honey this season is not due to an oversupply; but after careful investigation of the conditions we find there are two causes. In the first place there was more white comb honey shipped last year from the West into the Eastern markets than could be sold, and even to-day there are stocks of it still remaining in every market of any importance. On the other hand, the consuming trade has not wanted as much comb honey as was supposed would be the case, and for these reasons that article is going begging. Fancy No. 1 comb honey is selling at 12½ to 16. Lower grades must be sold at a sacrifice. The extracted-honey market is experiencing the same conditions, and is undergoing the same ordeal. Quote amber honey at from 8½ to 7 in barrels, according to the quality and quantity purchased. White clover is selling at from 7½ to 9½, according to the quantity.

For beeswax, from good to choice, we are paying 27 cts. delivered here. This must be free from dirt.

Cincinnati, O., Sept. 12, 1908. THE FRED W. MUTH CO.

**NEW YORK.**—The new crop of York State comb honey is now beginning to arrive in small quantities, and the quality appears to be very fine, especially choice white stock. While our market has not opened up as yet, and will not before about the first week in September, prices are unsettled and uncertain. We are having some demand for fancy and No. 1 white at prices ranging from 13 to 15, according to quality and style of package. No new buckwheat is on the market as yet, but we are informed that the crop will probably be quite large. A great many beekeepers seem to think that comb honey ought to sell at the same price as last year and before, not taking into consideration the fact that comb is a luxury and not a necessity, nor do they seem to take into consideration the general depression in business. We do not expect as good a demand as last year, nor do we think that last year's prices can be realized.

Arrivals of extracted honey have been quite free from the West Indies and the South, and the demand is fair. Prices obtained we consider full market value. We quote average grades from 58 to 65 cts. per gallon; fancy grades, 70 to 75. No new crops from near by are on the market yet, nor California. We have several cars now in transit, due here the first of September. We quote California sage at 9; orange, 8 to 8½; light amber, 7½ to 8.

Arrivals of beeswax are quite heavy, and the market shows a downward tendency. Prices are likely to go still lower. We quote 28 to 30.

Aug. 22.

HILDRETH & SEGELKIN,  
New York.

**SCHENECTADY.**—No new comb honey on our market yet, and but little demand, as many dealers carried over some stock which they are anxious to work off before buying the new crop. However, it is well to have some on hand for first customers.

CHAS. MACCULLOCH,  
Schenectady, N. Y.

Aug. 25.

**DENVER.**—The crop in Northern Colorado is almost a failure. There will be but little more than what the home market requires in this section. We quote No. 1 white comb honey, in 24-section cases, at \$3.15 per case; No. 1 light amber, \$3.00 per case; No. 2, \$2.85 per case; strained and amber extracted, 6¼ to 7¾; light amber, 7½ to 8¾; white extracted, 8½. We pay 24 cts. for clean yellow beeswax delivered here.

THE COLORADO HONEY-PRODUCERS' ASS'N,  
Denver, Aug. 25. F. Rauchfuss, Manager.

## PICTORIAL REVIEW.

A monthly beautifully illustrated. A few of the many departments and features: Home Care for Common Ills; Marketing for the Month; Kitchen Step-savers; Labor-saving Suggestions; House-building Plans; Millinery Lessons; Flower Gardens. Special Articles: Newest Fashions; Styles for Children; Home Dress-making Lessons; Recipes; Home Furnishing; Entertaining and Etiquette; How to Earn Money at Home, etc.

## LADIES' WORLD.

A monthly; an ideal publication for women and the home. A thoroughly practical household magazine, and treats of every subject of interest to women. Clean and wholesome, elevating in tone and entirely free from sensationalism. An up-to-date dressmaking and pattern department.

## MODERN PRISCILLA.

A monthly devoted to all kinds of needlework. Recognized as the leading fancy-work magazine of America, the authority on all kinds of embroidery, knitting, crochet, lace, costumes, lingerie, and home decoration. Gives practical patterns and instructions in all kinds of needlework.

## CLEANINGS IN BEE CULTURE.

A semi-monthly. The leading bee-magazine of the world. A glance at its pages will convince any bee-keeper that it is a magazine he can not afford to be without. The information it gives on all questions relating to the subject are invaluable to the bee-keeper, whether he has one colony or hundreds, and even if you are not a bee-keeper you will enjoy reading the paper. Interesting home and garden departments.

This offer is open for thirty days only. All orders MUST reach us by October 1st. Do not delay. Send NOW.  
Present subscribers to this paper can have GLEANINGS sent to some bee-keeping friend, and the other three papers to their address.

**THE A. I. ROOT COMPANY, : : : MEDINA, OHIO**

# Reasons for the Price

## OF MY

# Raspberry Honey.

I ask ten cents a pound for my raspberry honey. This is slightly above the market price, but there are reasons.

In the first place, very little raspberry honey is produced. It is a novelty—something out of the ordinary—like orange-blossom honey for instance.

In addition, it is of very superior quality; so much so that it was awarded the gold medal, in competition with other honeys, at the Jamestown Exposition. It has a flavor all its own—a flavor that smacks of the wild red raspberry of the woods.

Another most important reason why I should get a good price for my honey is the manner in which it is produced. It is left on the hives for weeks after it is sealed over, and thus acquires that finish, that smooth, oily richness, that thick, rich deliciousness that can be obtained in no other way.

It costs more to produce such honey, there is not so much of it,

and it is worth more than the ordinary honey; just as big Northern Spy apples, streaked with crimson and filled with juicy spiciness, are worth more than ordinary fruit.

As a finishing touch the honey is put up in bright new 60-lb. tin cans, securely boxed, and the boxes bound with iron so that they will bear shipment; in fact, I will guarantee safe arrival in perfect condition.

For a single 60-lb. can the price is \$6.25; for two cans in a case (120 pounds) the price is \$12.00 a case, regardless of the number of cases that are taken.

If you are not acquainted with this honey, send me ten cents and I'll mail you a generous sample, and the ten cents may apply on the first order that you send.

**W. Z. HUTCHINSON, Flint, Mich.**

## HONEY-JARS

from  
New York City

We consider the No. 25 jar with solid metal cap and waxed liner the best jar made for honey.

### OUR CLASSIFIED ADVERTISEMENTS.

We have frequent letters like the following:

Enclosed find \$1.50 for our three-line "want" advertisement in your Aug. 15th and Sept. 1st issues. Please discontinue it at once, as the first insertion secured us three cars of honey, and more is offered us by nearly every mail.

Denver, Col., Sept. 4. THE FRISBIE HONEY CO.

If you have honey to buy or sell, no other paper published can put you in touch with interested parties as well as GLEANINGS. Rates, 25 cts. per line per issue.

### CALIFORNIA FRUITS FOR ALL.

We all appreciate California fruits. Time was when there existed a prejudice against fruit produced in irrigated regions; but that has passed away for ever, and there are very few of us who do not relish California fruits—fresh, canned, or dried. The amount of fruit from the Golden State which reaches the States east of the Rockies is something stupendous. For example, there were 133,440,000 cans of fruit; 140,000,000 lbs. of raisins; dried fruits, 254,375,000; figs, 6,000,000 lbs.; prunes, 180,000,000 lbs.; oranges, 30,000 carloads; olives, 750,000 gallons; olive oil, 200,000 gallons; walnuts, 14,000,000 lbs.; celery, 3000 carloads; cabbages, 500 carloads; cauliflower, 350 carloads; beet sugar, 163,800,000 lbs.; butter, 5,000,000 lbs., and a number of smaller items, shipped eastward last year from California.

It is the opinion of experts, however, that the trade might be greater. The long haul and the large number of hands the goods pass through cause the prices to be too high in many instances, and in some cases the goods are kept too long and are not fresh. To overcome these two difficulties the California Fruit Products Co., of Colton, Cal., has set itself. The manager of this concern proposes to deal direct with the people who consume California fruits, and thereby eliminate the middleman altogether when dealing with thirty people. Last season was their first, but they were phenomenally successful, and orders poured in on them from every State. This season they will put up dried fruits in 2-lb. cartons with 25 of these in a box, making 50 lbs. in all. The cartons are assorted to suit. They also have asorted boxes of canned fruits (two dozen in a case), of apricots, peaches, pears, and plums. They also supply pure extracted sage and orange honey. In nuts they supply almonds and walnuts. They prepay the freight. Note the latter point. We imagine such an enterprise is bound to succeed. Doubtless many of our readers will be glad to favor the California Fruit Products Co. with a trial order.

# QUALITY.

*By the Bee Crank*

I am offering a discount of 7 per cent on bee-supplies sent out this month for next season's use. Next month the discount will be 6 per cent. I am very glad, for several reasons, that many bee-keepers are taking advantage of the liberal discount. I am securing a good share of the business because I have been giving my customers more for their money than many of them have been in the habit of securing elsewhere. The saving will represent an excellent investment for any bee-keeper, and with me it will be a great help by relieving the strain that comes with the tremendous demand for supplies in April, May, and June, when it seems that everybody wants supplies on the first train.

Buying bee-supplies is just like buying any thing else. It is not so much what you pay as what you get for your money. Here you get Root quality and prompt service. If you have not my catalog on your table I wish you would send your name and address, and state the number of colonies you have. I want to place your name on my mailing-list because I want your business. I want your business because I know that I can give you as good service for your money as

you can get anywhere. I will then send you printed matter; am going to write letters to you; and if I could I would call and see you. I have for sale what you are having to buy from time to time, and nothing short of your entire bee-supply business will satisfy me if you are within range of Indianapolis. Send your name and you will confer a mutual favor.

Honey.—I find that there is a good demand for honey from bee-keepers who have small apiaries, and where their demand exceeds their supply. In handling honey I have always been careful about the quality, just the same as in handling bee-supplies. Within the last month I have had large shipments from such well-known bee-keepers as S. D. Chapman, Geo. E. Hilton, Geo. H. Kirkpatrick, M. F. Perry, I. C. Lindley, E. A. Doney, Tofield Lehman, Guy Morrison, E. J. & Walter Hemple, and others. I mention these names to give an idea of the quality of honey that I am handling. If interested, let me send you my monthly quotations of the Indianapolis honey market, free.

I can use more beeswax at 28 cents cash or 30 cents in trade.

**Walter S. Pouder,**  
513-515 Massachusetts Avenue, Indianapolis, Ind.

#### SPECIAL.

The C. M. I. (Thos. G. Webber, Supt.) offers for the best display of Utah honey . . . . . 20.00

No premium awards will be made on entries not received at the association office by Wednesday, Sept. 30. Competition open only to bona-fide residents of Utah.

The above illustration shows Miss Phillis Hunt of Iowa, engaged in loading corn fodder on an Electric Handy Wagon made by The Electric Wheel Co., Quincy, Ill.

This young lady, according to reports, likes nothing better than loading and hauling corn fodder on these low wagons. She is about 16 years old and weighs 110 pounds and thinks she is able to haul as much corn fodder on a Handy Wagon in one day, as a full grown man can haul on the ordinary high wagon in the same length of time.

Miss Hunt, however, according to her letter, is not willing to undertake to haul all the corn fodder and it would be useless for any of our young farmer readers to imagine that they could avoid all this work, by contracting a matrimonial alliance with Miss Hunt.

### FIXING THE ROOFS.

This is the time of the year when the prudent husbandman goes around inspecting the roofs of the various buildings of the farm homestead. It would be poor business to leave off such work until winter; and we all realize the value of the old adage, "A stitch in time saves nine." The proverb applies most emphatically to roofs. In this connection it would be advisable for all interested to turn to the advertisement of the Anderson Mfg. Co., Elyria, O., on p. 1148. See what they have to say about guaranteeing the ability of a roof to withstand rain. We believe this firm to be perfectly reliable, and capable of carrying out its contracts or whatever it agrees to do.

### KALAMAZOO STOVES.

The famous firm of stove-makers who have made the magic words, "A Kalamazoo direct to you," almost a household phrase throughout the whole United States, is again with us this season, using our columns to herald the fact that they are still to the fore and expect to sell stoves direct from the original makers to the consumers. It takes a great deal of money to do the immense amount of advertising this firm does; but this is not nearly so great an expense as would be the cost of handling the same goods through jobbers and dealers, each of whom would retain a substantial profit. In giving this firm an order you are not working in the dark, for they have a world-wide reputation for doing just what they agree to do. They know they must treat every purchaser fairly, even generously, to hold their immense trade. They are fully alive to that fact. The stoves, ranges, and heaters they send are all ready to set in place, and the freight is prepaid, so that the buyer has little to do except to go to the depot and receive the stove, take it home, and set it up, all of which any ordinary person can do with ease. This is the time of year when families in the North begin to get their household heating-apparatus in order, and doubtless a good many will have to order a new stove in place of the old one which has done its duty. In this case kindly remember the Kalamazoo Stove Co., Kalamazoo, Mich.

### SAVING THE HEAT.

Now is the time to study ways and means for getting the rural home snug and warm this coming winter. In this connection it may be well to consider the fact that much of the stove heat goes out at the mouth of the chimney. You would hardly credit the amount of heat lost in this way. It is enormous. Some of it can be utilized by putting in a stovepipe radiator. Write to the Rochester Radiator Co. for particulars, who will show you how to prevent this waste.

# An Unsolicited Letter.

We are pleased to publish the following letter lately received from one of our well-known advertisers, whose copy for the coming season will soon begin. The letter below tells the story of splendid results obtained through the advertising columns of GLEANINGS.

## STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY

Gleanings in Bee Culture,

Medina,

Ohio.

Gentlemen:-

☞ We advise you with pleasure that we have advised the Long-Critchfield Corporation to include your publication in our advertising campaign for the months from October 1908 to May 1909.

☞ Considering the cost for space in your publication, Gleanings in Bee Culture is the best producer we have on our list, and comes second in our entire list of agricultural mediums. We hope that we will receive the same efficient service and attention that has been your custom during our past pleasant relations.

Yours very truly,

Stromberg-Carlson Tel. Mfg. Co.

HCS/OB.

*H. C. Stromberg*  
Advertising Manager.

What have you to sell to readers of GLEANINGS? If you want our opinion regarding the advisability of advertising in our columns, write us regarding it. We never recommend it unless we are convinced there is a good prospect of fair returns for the money spent, and, further, that you are in position to and will give our readers a square deal. Our circulation is 35,000 copies. Our rates are 25 cents per line. Watch for our next; but, better still, get your inquiry or order for space off to us before you miss another issue. Address all inquiries to

## STRAY STRAWS

DR. C. C. MILLER

YOUNG FELLOW, if you want to get near the head of the procession you'd better read carefully all that J. E. Crane says on page 1058. Then turn back to page 1056, where G. M. Doolittle says, "I would first requeen, with the best stock in the apiary, all colonies whose work had shown during the season that their queen was not of the very best order." A lot of trouble, that; but if you keep it up year after year you will be likely to get somewhere.

VENTILATION at the back of the hive by shoving forward the lower section-super certainly helps to prevent swarming. The objection to it is that it retards the finishing of sections nearest to the opening. This year, during the first part of the clover flow, and on through its height, this ventilation seemed to have very little effect on the sections. Later on, the effect was very great. It is probably advisable to close all such ventilation when the season is well advanced.

THIS YEAR, more than ever before, I have watched the matter of worker brood in drone comb. I have seen a number of cases, and always the mouth of the cell was contracted by the addition of wax. I think almost any bee-keeper, if he will look through his hives, especially in nuclei or colonies, with young queens, will find patches of drone cells thus modified. Is there a case on record in which workers were reared in unmodified drone-cells? [We do not know. Has any one else noticed any exception to this rule?—Ed.]

"HEREAFTER any employee caught smoking cigarettes will be dismissed from the service." That's the order issued by Supt. Easley, of the Rock Island R. R., Aug. 26. A clear head and steady nerves are needed by a man who has the lives of others in charge, and cigarettes and whisky are incompatible with a clear head and steady nerves. [This thing is becoming more and more general with the big roads. It is not a case of morals or sentiment, but because it is a matter of economy to employ men with steady nerves.—Ed.]

A QUEEN, after being clipped, if placed on top-bars, is likely to run about in a frightened manner, inducing the workers to take after her, and possibly ball her. Lay a brood-frame flat; and, after you have clipped your queen, drop her on the brood right among the bees, and she acts at home. This applies to those who hold the queen in their fingers while clipping her. [Yes; or

when you clip the queen, let her drop down *between* the frames. It is when she is on top of the top-bars, where there is no brood or comb, that she becomes frightened.—Ed.]

JAMES G. SMITH writes: "What for so much chin-chin about hive-number tags?" and encloses a red and a blue crayon. I don't know whether red or blue would be any more permanent than black. I have used black. On an unpainted hive it becomes dim, and, besides, hives are often shifted, and numbers changed, making movable tags better. [Red and blue pencil-marks on a slate tablet, after standing a time, become almost indelible. We have given up such a pencil because we could not afterward erase the writing. Whether the red or blue crayons would make a fast color we do not know.—Ed.]

THAT PRETTY shipping-case, p. 1060. Each of the front bars has two nails at each end. I use only one—abundantly strong, and I think it looks better. On p. 1061 the instruction is that the two holding cleats and the cover should be put in place and then one of the cleats nailed. I don't believe you do it that way, Mr. Editor. I suspect that you first nail one of the cleats in place without touching the cover at all, and then put on the cover and the other cleat, and nail. [We are inclined to believe that your method is better than ours. But the point we wanted to bring out was, not to nail on the two cleats first, and then expect the cover to fit.—Ed.]

HILDRETH & SEGELKEN speak of opening the case "by simply pulling out the one nail and sliding the cover off." I don't understand how you can get out that one nail without taking off one of the cleats. But, of course, that isn't much trouble. A woman insisted I was wrong, so we tried it. She took a smooth half-inch nail and drove it in; pried up with a knife close to the nail, and then pushed the cover down. That left the nail projecting, to be drawn with a claw-hammer. I gave it up. But you must send a woman with each shipment to show the grocer how. [Almost any grocer is familiar with that little trick of the trade. We hardly believe, however, that, in the majority of cases, it is necessary to use the nail at all. The friction of the cover should be sufficient to hold it in place.—Ed.]

THE BEES of No. 29 were very dark. July 17 I killed their queen. A yellow queen was introduced, and was at large in the hive July 22 or 23. Not until Aug. 22 were yellow bees seen in supers, and then only a few. It seems that the young bees stayed on the brood-combs at first, and (assuming that the queen promptly began laying) did not enter the supers until nine or ten

days old. It looks a little unreasonable, and possibly the case was a little exceptional. At any rate, it is not hard to believe that bees do not enter supers until after they are old enough to have taken a flight. In that case, Mr. Editor, it is easy to see that there should be no loss of young bees when supers are piled up and covered with a Miller escape. My strong point, however, is that, if there is such loss, I ought to have noted something of it in all these years. [We are prepared to believe with evidence now in hand that there will be no very young bees in the supers. In a practical way, this means that when bee-escapes are applied on supers removed from the hives, there will be no loss from the young bees that can not fly back to their hives. If any one knows that this is not orthodox, let him hold up his hand and tell his story.—ED.]

THE LIFE of a worker in the busy season averages six weeks—perhaps less. Suppose we have a colony of best stock and one of the poorest. Swap the queens at the beginning of the honey harvest. It looks reasonable that in six weeks or so the colonies will swap qualities. But the observation of years has forced me to believe that the change of character comes much more slowly than I had believed. What the queen is up to the beginning of the harvest seems to settle almost fully the result of the harvest, even if prolonged. I don't know why, but it seems to be so; and yet sometimes the introduction of a queen seems to change the character of a colony within a few days. [Perhaps you are right; but we do not see any scientific reason why. We can readily see how the introduction of a young queen to replace one that is failing might inspire energy in a colony. But suppose there were two colonies, both queens equally prolific. The workers of one are energetic, and gather twice as much honey as the workers of the other. Now, would taking the queen out of the good colony and putting her into the poor one make the bees that are not her daughters good workers, like those that she left in the other hive that were of her own blood? It is a rather interesting question, and we should like to know if others have observed the same thing.—ED.]

THE OLD-TIME fiction of queens hatching exactly at 16 days has cost more than one bee-keeper dear. Queens (especially hybrids) will hatch out any time from the 14th to the 18th day, *Irish Bee Journal*, page 32. In a full colony, 15 days is probably near the mark; in a nucleus, longer. But no queen should ever be reared in a colony so weak as to lengthen the time of hatching to 18 days. [The *Irish Bee Journal* may not be far out of the way in this statement, although we have not heard of many queens that emerge from the cell in as short a time as 14 days from the time the egg is laid. In our queen-rearing yards we graft the larvæ when they are about 48 hours old. Our Mr. Pritchard\* thinks that he can tell very closely by examining the larvæ just how old they are, and he tries to use larvæ which are 48 hours old so far as he is able to judge. As a rule he does not distribute the ripe cells until ten days from the time of grafting, and he finds that

the queens ordinarily emerge the day after. This would make a total elapsed time just 16 days, counting three days before the egg hatches, two days before grafting, and eleven days after. There are times, however, when he is obliged to distribute the ripe cells in only nine days, as the queens begin coming out too soon. This would make the total time fifteen days. We do not now remember a time when queens emerged from the cells in fourteen days from the time the egg was laid; and, although it might happen, we think it would not be at all usual. Then, on the other hand, if the weather conditions are not right we find that the total time is as long as seventeen days, and there might possibly be cases where the queen would not come out until the eighteenth day. We should say, in view of these facts, that the time to be counted on ordinarily is sixteen days, although very often so little time as fifteen days is taken or as long a time as seventeen. See editorial elsewhere.—ED.]

## EDITORIAL

By E. R. ROOT.

THE SON-IN-LAW OF REV. L. L. LANGSTROTH AT THE OHIO STATE FAIR.

THE publishers had an educational exhibit of bees, honey, and bee-appliances at the State Fair. Among the many visitors who came to pay their respects was Mr. John W. Jamison, of Roxabell, Ross Co., O. While Mr. Jamison is a prominent agricultural writer, he will be better known to the bee-keeping world when it is said that he married the youngest daughter of Rev. L. L. Langstroth. Her sister, Mrs. Anna M. Cowan, the eldest daughter, died a few years ago, so that Mrs. Jamison is the only survivor of the Langstroth family.

We are glad to say to her that her father's great invention of a practical movable frame, and his book, "Langstroth on the Honey-bee," have placed almost all the modern bee-keepers of the world under everlasting obligations to him. We are sure we are voicing the sentiment of all of them when we say we wish she may enjoy a long life, and health long enough, at least, to see the full fruition of her father's great work.

THE SUBSCRIPTION-LIST OF THE AMERICAN BEE-KEEPER PURCHASED BY THE AMERICAN BEE JOURNAL.

IN our issue for Aug. 15, page 989, we referred to the fact that the *American Bee-keeper* had suspended publication, and we have since been advised that the *American Bee Journal* has acquired the subscription-list and will fill out all unexpired subscriptions.

In this connection, perhaps we should mention the fact that the *American Bee Journal* has advanced its regular price from 50 cents to 75 cents per year; three years for \$2.00; five years for \$3.00. This change took place September 1, and was made necessary, the publisher states, by the increased cost of every thing that goes into a periodical. A number of the popular dollar magazines have advanced to \$1.50. Some of the

\* Mr. P. reared 2000 queens for us the past season, and large numbers of them in previous years. His habit of close observation and his extensive experiments should count for something.

daily papers that formerly sold for a cent are now selling at two. We have not as yet advanced the price of GLEANINGS; and as we do our own work in our own plant with the very latest modern machinery, we hope an advance in price will not be necessary.

#### HONEY-CROP CONDITIONS — PRICES.

THERE is no material change to report over that given on page 1050 of our last issue. As confirmatory of the shortness of the crop in Colorado we introduce a letter right here from Mr. R. C. Aikin, who is in position to know:

Colorado has little honey this year. Western slope is reported fair; Arkansas Valley, half a crop; northern (Denver, Boulder, Longmont, Loveland, Ft. Collins, Windsor, and Greeley) will not supply the home market. Only once or twice in 20 years have I had so little as this year. R. C. AIKIN.  
Loveland, Col., Aug. 29.

This means that the market for Eastern clover should become firm; but by reference to some markets here in the East, we find that prices are unsettled in some sections and good in others. We hope for improvement.

#### CANE VS. BEET SUGAR.

MR. CRANE calls attention to the controversy in regard to the difference between cane and beet sugar. Theoretically they are the same; but experts note a difference. In London, the chief beet-sugar market of the world, cane sugar, as a general thing, commands a slightly higher price than beet sugar. *The Sugar Beet*, an excellent magazine devoted to the interests of the industry in this country, recently admitted there is a difference, and accounted for it by stating that the particles of carbon lie closer together in cane sugar than in beet sugar. This, of course, would make the cane sugar the sweeter of the two. Be that as it may, the juice of the beet contains a very bitter principle known as *betaine*, and it takes great skill to get rid of it in making the sugar. Sugar cane, on the other hand, has a delightfully sweet juice; and, if sufficient care is used, a sugar almost identical with maple sugar can be made from it. Beet sugar is often colored with ultramarine blue, which is against it for feeding purposes. There is even a difference in cane sugars. The syrups of Florida and Georgia are superior to those of Louisiana, chiefly, I think, on account of the low heavy soil of the latter as compared with the light, warm, friable soils of Georgia and Florida. Porto Rico and Barbados are celebrated for their syrups; and in both of them the soils are light and well drained. I believe bees are better judges of sweets than we are, and we might as well cater to their prejudices.

W. K. M.

#### THE PURE-FOOD EXHIBIT AT THE OHIO STATE FAIR; WHAT OHIO IS DOING IN THE ENFORCEMENT OF PURE-FOOD LAWS.

ONE of the most striking exhibits—one that attracted a large amount of attention—at the Columbus Fair was one made by the Pure-food Department of the State of Ohio, of which Renick W. Dunlap is Commissioner. The exhibit was under the immediate charge of two of his inspectors, E. J. Riggs and George E. Scott.

It comprised a large collection of food and drug products gathered from all over the State,

showing various examples of adulteration, the use of injurious preservatives and coloring matters, and, in general, some ingenious specimens of misbranding. Thanks to Commissioner Dunlap and his associates, there is not a State in the Union where the pure-food law is better enforced.

A feature of the exhibit showed the attempts of certain manufacturers of foods to get around the law, or to dodge the special clause of the statute having reference to the general subject of misbranding. In some cases the preservative or coloring matter would be indicated in very small type; in other cases the adulterant would be named, but in such an ambiguous way that the average consumer would read the headlines, supposing he was buying a certain definite well-recognized food product, when in fact he was getting only an imitation of it. But the Pure-food Department had traced down a lot of these cases, and compelled strict compliance with the provisions of the law.

Comparatively speaking, there is but little adulteration in Ohio. In the case of vinegars, catsups, jams, and various preserves, there has been some injurious imitations. Candy has been found to contain considerable injurious coloring matter, especially of the coal-tar products; the catsups and meats, an excessive amount of preservative.

A very interesting part of this exhibit were pieces of muslin cloths. Some of them, about half a yard wide and a yard long, were colored from the dyes taken from a single bottle of catsup or from a few candies. The amount of coloring matter used in some cases was enough to give strong rich tones to large pieces of cloth. Think of that amount of stain going into the human stomach, and for no other purpose than to deceive! These dyed cloths were displayed around the exhibit in a way that was very striking. These coal-tar dyes are used because they are cheap, and because they help to bring up the appearance of certain adulterated goods, or of pure food improperly prepared; but Uncle Sam and Ohio say their use shall stop.

The Pure-food Department insists that benzoic acid, and other preservatives of a like character, if strong enough to preserve the food would be likewise strong enough to prevent the digestion of those same foods when taken into the human stomach, and it is right.

But perhaps the most common adulterant of foods was saccharine, used in canned goods. This article is in no sense a food, but a powerful medicine that is produced from coal tar. It is 500 times sweeter than common sugar; and as it is very cheap the temptation is to use it in canned goods, for it certainly imparts to them a sweet flavor. When it is remembered that *4 lbs. of this powerful drug costs \$9.00, and has the same sweetening power as a ton of sugar costing \$1.20*, one can see how unscrupulous canners would use it in spite of its effects on the lives of our people were it not for the national and State pure-food laws and their enforcement.

There is a need of having just such men as Dunlap and his associates, who can not be bought or cajoled, at the head of the Food Department at Columbus to prevent some rascals from sending us prematurely to our graves. The way they are making them come to time should be a

warning to all purveyors of food of any sort. What Ohio is doing, other States are doing more or less thoroughly; but Ohio has set up a high standard that many are not following.

MIGRATORY BEE-KEEPING; HOW O. O. POPPLETON  
PRACTICES THE SCHEME BY MEANS OF GASO-  
LINE-LAUNCHES ON THE INDIAN RIVER,  
FLA.; THE "LONG-IDEA" HIVE.

WE have just had the pleasure of a visit from Mr. O. O. Poppleton, the veteran bee-man of Stuart, Fla. He had just attended the G. A. R. reunion at Toledo, and stopped off at Medina for a couple of days before returning. Our old bee-keepers will remember Mr. Poppleton as coming originally from Williamson, Iowa, although a native of Ohio. In Iowa he was a very successful bee-keeper, and was an occasional contributor to the bee-journals. But ill health finally made it necessary for him to go southward, and the next thing we heard of him he was located in Florida, where he has been keeping bees ever since.

Mr. Poppleton has the distinction of being, possibly, the only bee-keeper in the United States who uses what is known as the Long-idea hive—a hive that was much exploited some thirty years ago. Instead of adding extra room or giving surplus combs on top, story by story, the Long-idea principle means an extension on a *horizontal line*. It calls, therefore, for a *long* hive. The one Mr. Poppleton uses may hold 25 twelve-inch-square frames. As the season increases, and more room is required, the frames are put at the side, the division-board being shoved over. This is continued until the entire brood-nest is filled.

Our friend still believes in the hive, and thinks that, for his purpose at least, it is far ahead of the Langstroth tiering-up principle. There are no heavy stories to lift off and on. The hive never becomes top-heavy, and no wind blows it over. When we asked, "Are not these hives awful to lift?" he replied, "That is where you are mistaken. Two men can handle them very easily; and they are never toted around except to put them in and out of the boat in migratory bee-keeping. At all other times there is no lifting of heavy stories—simply pull the frames out of a single brood-nest and replace them." He could not understand how the whole bee-keeping world had gone after the tiering-up principle, when the other plan has so many advantages.

Mr. Poppleton enjoys the distinction also, of being the only migratory bee-keeper probably in the United States. Although there are many of them in Europe; and we have read how the bees are transported down the Nile in Egypt.

But since the advent of the gasoline-launch, he has worked out the principle along entirely new lines. He first started with one good-sized launch and a lighter, and now he has put a motor into it so it is also self-propelling.

Up and down the Indian River there are many kinds of flora that come into bloom at different times. When there is nothing doing at one yard and something doing somewhere else, he puts his hives on his launches and then carries them to pastures new. When this locality fails, the hives are put on the water again and moved once more, and so on as long as the season lasts. On this

scheme of migratory bee-keeping he sometimes has yards a hundred miles apart.

Mr. Poppleton has been in that locality long enough to know its peculiarities. Lest some one may get the idea that he has a bonanza all by himself, and then think of moving down there, and working on the migratory plan, it will be proper to say that our friend has been "enjoying" a series of poor seasons. Better stay out.

In past seasons Mr. Poppleton has had some experience with bee-paralysis, for his portion of the State seems to be somewhat favorable to its development; but instead of being driven out of the business he set to work and learned how to cure it. This cure has already been made public through the various bee-journals, and is now incorporated in the A B C and X Y Z of Bee Culture under the general heading of "Diseases of Bees."

While Mr. Poppleton fears bee-paralysis no more he found he would have to quit importing queens from outside localities, and hence was compelled to develop a strain of his own that would be able to stand the inroads of that disease. In this connection we may remark that his experience tallies very closely with that of Mr. F. R. Beuhne, on page 998, Aug. 15.

Mr. Poppleton, besides being one of the old veterans of the war of 1861, is also one of the veterans in the bee business. He was contemporary with Langstroth, Grimm, Hetherington, Quinby, Tupper, King, Gallup, and many others of those early days. He is still very much interested in the general subject of bees, and especially in every new thing that has come up of late. His enthusiasm, although tempered by an experience that every thing that glitters is not gold, is just as keen as that of a beginner who has just arrived at the first stages of the bee-fever. Indeed, we spent several pleasant hours in talking over things new and old.

He has promised to send us some photos showing his launches, his hives, and his manner of keeping bees on the migratory plan. These we hope to present at a later time, and perhaps report a few more ideas that we gleaned from this veteran of many summers.

CAUSE OF SICK BEES ON THE SIDEWALK IN FRONT  
OF OUR BUILDING DURING THE HEIGHT  
OF THE HONEY-FLOW.

EVERY year we have noticed during the height of the honey-flow large numbers of bees on the sidewalk and brick pavement unable to fly, and apparently suffering a great deal of pain. With their feet they would tug at their bodies, and sometimes so great would be their contortions that they would crowd the abdomen off from the thorax. We were unable to account for this peculiar phenomenon, and we supposed they were dying in equal numbers everywhere in the vicinity of the yard. We have reported this at various times in these columns, but no one has been able to offer a satisfactory solution.

In visiting Mr. L. A. Aspinwall, of Jackson, Mich., our conversation drifted to the aforesaid suffering bees. Then Mr. Aspinwall remarked: "I think I can tell you what is the cause. Is it not a fact that you have a good many telephone wires passing over this street?"

"Yes," we said, "they are strung up on both sides; and, what is more, the line of flight is concentrated at this joint by an open passageway between the building and some tall evergreens."

"Now," said he, "you watch some time when the honey-flow is on, and you will see the bees bumping against those wires and dropping down in aimless flight until they tumble on the sidewalk and in the grass. During a dearth of honey there will be very few flying bees, and one that might accidentally hit a wire would escape of servation."

It is very clear to us that our friend has struck upon the true source of trouble. There has been no honey-flow on since visiting Mr. Aspinwall, so we can not verify his statements; but the very fact that there are no dead or struggling bees to be seen except at the height of the honey-flow, would seem to support Mr. Aspinwall's theory. We might remark that at our south yard, where there are no telephone wires, we have never noticed these sick and struggling bees. We shall be glad to hear from others.

#### NOT A BAD IDEA; A SCHEME FOR AVOIDING THE LIFTING OF HIVES AND SUPERS.

OUR Mr. F. G. Marbach, of the machine-shop, has been working on various forms of hive-lifters. He finally inquired why a bee-keeper could not have his hives arranged in nice perfect rows, and at each end of a row set a post solidly into the ground, said post sticking up some six or eight feet above the level of the ground. He would then stretch a wire cable from the top of each post, drawing it up taut, as the telephone people do, with a rope and tackle. Next he would have a block and pulley, supported by a grooved wheel running on the wire or cable.

There, now you see the idea. This tackle could ride on the trolley wire, and be adjusted to any hive, lift up the supers, and hold them suspended, or move them to any one of the hives in a row, or carry them to the end of the row and deposit them on a wheelbarrow. No matter how rough or uneven the ground this arrangement could handle the supers very easily.

You may say that such a trolley line could not hold up a load of filled supers. There you are mistaken. The telephone men work on their lead-covered cable lines supported by a basket or platform which hangs by means of pulleys from the cable that holds lead pipe. They then pull themselves along in midair, supported only by the wire that supports the cable. They are perfectly safe in doing this, because the tensile strength of the wire is amply sufficient to hold them.

There are probably hundreds of our readers who have seen this feat performed, and there is no reason why this same principle could not be applied over a row of hives. The rows might be a hundred feet long, and it is perfectly feasible to put in 35 or 40 hives to the row. Two or three rows would take all that one could put in one yard. These trolley lines can be easily put up by any one who knows how to string fence wire; but one would have to borrow or get a heavy tackle of the telephone people to produce the necessary tension of the cable or wire so it

would support in the middle a weight of from 50 to 75 lbs.

#### SIZE OF LARVÆ TO SELECT FOR GRAFTING.

THE advice commonly given in regard to larvæ for grafting is to select the smallest ones in order to be sure of getting the youngest ones. There is a probability, however, that this rule is not a safe one to follow, since larvæ of exactly the same age are not always of the same size. Our Mr. Pritchard, who has charge of one of our queen-rearing yards, has often noticed quite a variation in the size of larvæ, all of which are practically of the same age. In a populous colony he has inserted an empty comb, the cells of which are cleaned and polished, but which as yet contain no eggs. He catches the queen and places her on this comb, and then finds at the end of perhaps an hour that she has laid eggs in cells covering an area as large as his hand. He now carefully marks this area on the comb in order to be able to observe the growth of the larvæ. In this way it is possible to watch larvæ that are of the same age. At the end of four or five days, when the eggs have hatched and the larvæ have begun to grow, he finds that some are much smaller than others, and he believes that it is much the better plan in grafting to select those that have the best start. This conforms to the rules for the breeding of animals generally; for what breeder would not select the largest and finest individuals possible?

Some may ask how it is possible in a large queen-rearing yard to know whether certain larvæ owe their larger size to the fact that they are more vigorous or better fed, or that they are older? This is an important point, for a beginner might not be able to tell the difference. Mr. Pritchard believes, however, that any larva not yet curled up so that the two ends nearly meet is suitable for grafting, and he therefore selects the largest and finest-appearing larvæ that are yet comparatively straight in the bottoms of the cells. Furthermore, whenever he is looking over the combs in the strong colony containing the breeding queen, and finds a small patch of comb in practically every cell of which eggs are just beginning to hatch, he marks this carefully by enclosing the space with large wire staples such as are used to fasten bottom-boards on hive-bodies, etc. Small sticks will not do, for the bees carry them away; but these large wire staples answer the purpose admirably. Two days later, when he is ready to graft, he takes up this comb which he marked, and selects the finest of the larvæ between these staples. He is thus practically sure of obtaining what he wants. Late in the year, or during cool weather, it is not always possible to find a patch of comb containing larvæ of the same age, but earlier in the season this plan can be utilized very easily.

It would seem that the most vigorous larvæ should develop into the most vigorous queens. At any rate, queen-breeders ought to leave no stone unturned in the breeding of queens to develop the best. The best stock should be used to start with that can be obtained, the best larvæ chosen, and strong colonies should be made use of to care for the uncapped queen-cells. A queen that has been handicapped from the start can not become the mother of strong and vigorous bees.

## CONVERSATIONS WITH DOOLITTLE

### PROFITABLE AND UNPROFITABLE WORK IN THE APIARY.

"Mr. Doolittle, I have been wondering if I have not been doing too much unnecessary work with my bees."

"There is no doubt that a great deal of the work done in many apiaries is not very profitable, Mr. Jones, and would be characterized as 'fussing' by many; still, it often happens that the beginner learns much about the bees by this same fussing, hence the time so spent is not altogether thrown away."

"But is it not as important as any thing in making money out of bees to work so that every stroke counts?"

"Undoubtedly that is correct. It is easy to put a large amount of work on the bees, by the one having the bee fever, that amounts to little or nothing after the first principles have been passed. After the business is well understood, no doubt a greater satisfaction will come to us by making every stroke count, as you say."

"I think that is right, and I should like to have you tell me just what are the really necessary things to do with the bees."

"If you were to ask the farmer bee-keeper this question he would tell you to hive the swarms when you see them and put on the supers. Then the enthusiast who has just read one or more of the bee books and papers would be apt to say, 'Stimulate brood-rearing, equalize stores, make nuclei, raise queens, examine all colonies once a week during the summer, and, as often as it is mild during the winter, extract the honey in early spring and feed it back so as to get the cold solid slabs of honey from the middle of the brood-nest; extract the honey in the fall, and feed sugar syrup for wintering, etc., till you are almost dizzy with the rounds you must make with the bees the whole of the year.'"

"But what do you say?"

"The most practical course is by no means midway between these two extremes, as you probably expect me to say, for from my later years' experience I believe it lies much nearer the farmer's method than the enthusiast's. In other words, my motto now is, the largest possible amount of honey with as little well-directed labor as is possible to secure said amount of honey."

"What do you mean by well-directed labor?"

"The farmer loses much honey by *not* doing a few things at the right time and in the right place. The practical successful apiarist does just those things, but no more. Or, when he has just the necessary work done at *just* the right time and in *just* the right place, he does not hinder the bees in their work by upsetting all their house-keeping in pulling their well-arranged plans inside the hive to pieces, thus causing them to spend much of their precious time during the honey flow at repair work."

"Would you mind naming the things which you consider as paying work in the apiary?"

"Briefly stated, all colonies should be examined rather hurriedly in early spring with as lit-

tle disturbance as possible, to see that they have stores enough to last them till pollen becomes plentiful, when they should be examined more carefully to see that they have good queens and sufficient stores to carry them through to the white-clover harvest, taking advantage of this inspection to do all desirable cleaning of hives, pruning of propolis and burr-combs, and clipping of queens. All hives and supers needed for the season should be in readiness beforehand to be used at a moment's notice when they are needed. Then some simple and uniform plan for swarming should be adopted which will prevent all watching or climbing tall trees for after-swarms, for these have no part in a well-regulated apiary. Some good plan of artificial swarming to control increase is better by far for the busy man's use than natural swarming in any shape. Poor colonies should be requeened, the supers put on at the right time, more added as needed, and *just when they are needed*, and the filled supers should be removed promptly. Next, the honey should be graded and packed in accordance with some definite system as early as possible, to take advantage of the early market, so that any chances for selling it to good advantage may not be lost. The necessary number of queen-cells should be raised from the best stock so as to supersede all failing queens at the end of the honey harvest, and nearly all drone comb as well as irregular or imperfect combs should be replaced by straight worker combs; and the bees should be gotten ready for wintering during September and the first half of October."

"I notice you do not name some of the things neighbor K. insists are essential."

"Probably not. One of the tantalizing things about apiculture is that some apparently good authorities think some things are necessary, not to say vital, and other equally good authorities say they are not."

"How do you account for this?"

"Locality accounts for much of it in my opinion. In some portions of the West the clear dry atmosphere makes it possible for the bee-keepers to adopt a different system of management from that necessary here at the East."

"But when two authorities living near each other put forth different opinions, what am I to think?"

"Both can hardly be right. One may be competent in his practical work, but lacking as a close observer, or in scientific accuracy, and quick to jump at conclusions. Or, as is sometimes the case, he may be one of those who thinks it more virtue to claim knowledge than to admit or say frankly, 'I don't know.'"

"I take it from what you said that you do not think stimulative feeding in the spring would be profitable labor."

"I am sure it is not with me, for I have tried it very many times by feeding a certain number of colonies and leaving the same number of colonies of equal strength without feeding, but with plenty of honey; and I find that those not fed give the best results in honey when an inventory of each lot is taken in the fall. I know some claim this is the only way of having colonies prepared for the harvest. But it does not necessarily mean that stimulation must be profitable because it stimulates brood-rearing. There are

two questions involved in this stimulative feeding. First, which is better—a strong colony of old bees, whose vitality is unimpaired by previous brood-rearing, or a weak colony of young bees 37 days before our honey harvest is to begin, that being the time required to rear laborers for the fields from the egg. Second, when natural pollen (the best kind of stimulant in connection with plenty of honey in the hive) begins, as it does here, more than 37 days before our earliest harvest commences, and continues without a break, is it any additional stimulation to feed thin honey? All of my experience says that colonies which do not begin brood-rearing in earnest till pollen comes in plentifully from the elms and hard maple will excel by far those which are stimulated to brood-rearing earlier, so that the old bees die of exhausted vitality before the honey harvest arrives."

## SIFTINGS.

By J. E. CRANE

It is a great satisfaction to have such a frank, outspoken report as we find on page 869 on the good and bad qualities of the Caucasian bees. We feel somehow now as though we knew something definite. Thanks.

Dr. Miller inquires, page 927, Aug. 1, if we found any thing in the platforms of the two great political parties about the greatest public question of the day. No, doctor, we didn't, and we were looking too. Too bad.

Mr. F. G. Marbach's suggestion, page 929, of making a honey-board of two sections, is a good one. The only objection I find is that, in practice, one piece is quite apt to be missing, having been used for something else. It is bad business to do so; but with help you can not always find things in place. [See Mr. Brovald's suggestion, page 1137.—Ed.]

I find an error on page 895, first column, a little below the middle. In referring to the variation of cane sugar in honey it says, "It is caused by differences of soil or climate, etc." It should have been, "Is it caused by differences of soil or climate?" I do not presume to know. It is one of those scientific questions we should like to know; but perhaps it is not of great practical value.

W. K. Morrison says, page 875, that a writer in one of the European journals maintains that it is only from the second crop of red clover that bees extract any nectar, while he imagined it was mostly gathered from the mammoth clover. Hereabouts I have seen bees work as freely on both the first and second crops of medium red clover as on any other clover; but it was only when conditions were favorable and only occasionally.

By the way, Mr. Morrison is one of the most cosmopolitan writers that have enriched the pages

of GLEANINGS, and his Gleanings from Foreign Exchanges are full of meat, and well worth the careful thought of every bee-keeper.

And there is Dr. Miller, page 939, with "the smile that won't come off." Good! Surely he is our "grand old man." Old, did I say? No, he is not old. I don't think he ever will be. I have read somewhere in an old-fashioned book that there are those who are made "partakers of the divine nature." Such do not grow old. I believe no other contributor to our American bee-journals has a larger place in the hearts of the bee-keepers of our country than Dr. C. C. Miller.

I believe Dr. Miller's estimate, page 867, July 15, of the amount of wax needed for storing 100 lbs. of honey is rather high. I have two or three times had occasion to melt up section combs, and I succeeded in getting only about four pounds of wax to the hundred of honey. There is, however, quite a variation in the thickness of combs or in the amount of wax used by different colonies in comb-building.

The remarks of J. L. Byer, page 935, are of value as to danger in the use of cyanide of potassium. I have had occasion to use both cyanide and bisulphide of carbon this season, and I find but little difference in cost, and for a small space the bisulphide is much more convenient to use, and on the whole I prefer it. But when a large space is to be filled I am not sure but the cyanide treatment would be preferable.

The article by J. L. Byer, page 887, on wax-rendering, stirs within us a fellow-feeling. I made a press a few years ago something after the Hatch-Gemmil type, and have often been surprised at the amount of wax I have secured. I do not press so hard as formerly; but after pressing a batch fairly, I loosen the screw and remove the follower; pour in hot water, and stir up the slumgum thoroughly; press again, and get at the second pressing about ten per cent as much as at the first pressing.

If all those who can not afford to take a bee journal could only learn "how to make wax" it would pay many times over for all the journals devoted to bees in this country. Further, if all who render wax knew how to do it properly the supply of this useful article would be largely increased, and the wax famine that has seemed imminent for a few years past would be postponed for some time.

On page 928 we find the following: "We notice by the *American Grocer* that the Kansas Board of Health, which has the enforcement of the pure-food laws of that State, says that grocers who sell beet sugar for cane will be subject to prosecution. We wish this ruling might become general all through the United States, as it is impossible now to know what one is buying—cane or beet sugar." Now, we seem to be not a little mixed on this sugar question. I have been accustomed to think of beet sugar as cane sugar, and yet the Kansas Board of Health, as well as the editor of GLEAN-

INGS, thinks there is a marked difference; and I have heard bee-keepers express great fear that, in buying granulated sugar, they might be buying beet sugar unwittingly. I find in Remson's Chemistry, page 668, under the paragraph "Cane Sugar," "This well-known sugar occurs very widely distributed in nature, in sugar-cane, sorghum, the Java palm, the sugar-maple, beets, madder root, coffee, walnuts, hazelnuts, sweet and bitter almonds; in the blossoms of many plants, etc."

The New International Encyclopedia says, "Cane sugar is found in varying quantities in many plants; but sugar cane, the sugar-beet, the sugar-maple, and various species of palms, are its only commercially important sources." The American Encyclopedia makes substantially the same statement as to the sources of cane sugar. I notice, however, that the Standard Dictionary says that "Sugar is called according to its source; as, cane sugar, beet sugar, maple sugar, etc." I have supposed there was chemically no difference between refined sugar, whether its source was sugar cane or beets or maple-trees. It was all "cane sugar."

It does not necessarily follow that, because two substances are the same chemically, they are in every respect alike. The purest diamond and the blackest carbon may be the same to the chemist. Now, who can tell us just the difference between the refined product of sugar-cane and sugar-beets? Is one less desirable to feed bees for winter than the other, or for any other purpose?

Middlebury, Vt.

## BEE-KEEPING IN THE SOUTHWEST

BY LOUIS SCHOLL

### A NOTE OF WARNING.

Samples of foul brood have been sent me from various parts of the country for identification, and no objection arises on this score, although it takes a good deal of time, etc., in correspondence. But *when combs simply rotten with foul brood are wrapped in a single sheet of thin paper, and sent to be identified where other bees may be subjected to the dread scourge, it is time to call a halt.* Don't do it. Proper directions have appeared before for sending samples of foul brood for identification; and even then send none until you have received proper instructions for it. These will be gladly given, and then it may be known when it is to be expected.

It is against the law to expose other bees to foul brood, or combs of honey, wax, and even hives and appliances of foul-broody colonies; and there is a fine for it. Copies of the foul-brood law have been published far and wide, and every bee-keeper ought to take enough interest in this matter, if not to know the law by heart to have at least a copy of it handy for reference. If you have none, write the State Entomologist, College Station, Texas, for one. Also address all matters pertaining to information about foul brood to this office. Our reason for being rather particular is largely due to samples received wrapped in thin paper, through which the hatch-

ing bees had gnawed and were escaping, besmeared not only with the honey from these rotten combs, but the juices of the mashed diseased larvae. It is well, therefore, that great care be exercised, and the unnecessary spread of diseases prevented.

### AN APPROPRIATION NEEDED FOR FOUL-BROOD INSPECTION.

As a result of a "foul-brood agitation" at the annual meeting of the Texas Bee-keepers' Association, at which a committee was appointed known as the "Legislative Committee," active work has been begun. F. L. Aten, of Round Rock, is chairman, with T. P. Robinson, of Bartlett, and Secretary Louis H. Scholl, of New Braunfels, as the two other members. This committee will come together from time to time until the meeting of the legislature in January, to devise plans for obtaining an annual appropriation of \$3000 for defraying the expenses of thorough inspection work in bee diseases as per the report herewith of the committee appointed during the session of the convention.

### REPORT OF COMMITTEE ON FOUL-BROOD LEGISLATION.

We, your committee, beg to report as follows: That we ask for an annual appropriation of \$3000, to be used in the eradication of foul brood and other infectious diseases of bees, to be placed under the direction of the State Entomologist in accordance with sections 1 and 2 of the foul-brood law of Texas.

|                 |        |
|-----------------|--------|
| L. H. SCHOLL,   | } Com. |
| W. O. VICTOR,   |        |
| T. P. ROBINSON, |        |
| F. L. ATEN,     |        |
| C. E. SANBORN,  |        |

While this sum may not be necessary for an inspector alone, which, however, here in Texas would necessarily be higher than in many States on account of the greater territory that must be covered, a portion of it might be very profitably used in the Department of Entomology for foul-brood investigation which is not strictly inspection work. Such work, carried on whenever inspection can not be done, can be made to aid the inspectors, and should prove profitable to the bee-keepers of the State.

The real inspection of the bees, wherever necessary, and the proper caring for those that need attention, is, of course, the most important. With this in mind, the following letter has been formulated by the association for circulation:

*Brother Bee-keeper:*—Foul brood is breaking out in almost every part of our State. I have hundreds of letters from north, central, east, south, and southwest Texas, asking for help. Foul brood has come to these places, and the apiaries are threatened. Nothing can be done for the bee-keepers, as there is no money to do it with. Your bees are threatened. We need a State inspector to look after our interests so that they will be protected and saved from destruction.

We have a foul-brood law, but no money for an inspector. Our association has taken the matter up, and will go before the next legislature to obtain an annual appropriation for carrying out this work. But your help and co-operation will be needed. You need to become stirred up about the matter, and to stir your neighbors up. Every person who has the bee-keeping interests at heart should not fail to do his utmost toward getting this necessary appropriation from the legislature next January.

Begin now. We must combat foul brood or suffer. This is a worse scourge than many suppose, because they have had no experience with it. Find out all you can about it. It may save you hundreds of dollars. It may break out in your neighborhood if not already there, and you know nothing about it until too late. So let us all strive for an appropriation, a good inspector, thorough inspection, and save our bees.

Let me hear from you about this most important matter. Write me if there is or has been any foul brood in your neighborhood. Do not be afraid to do this. It will all be confidential. It will help me to plan ahead and lay out the work for inspecting later, when we get an inspector. Help the association's efforts in this move by being an earnest member and by doing your part by it. Texas is now the leading honey-producing State, so let us keep her there.

L. H. SCHOLL, Sec'y Legislative Com.

## POINTERS FROM THE REAR END OF THE BEE

TOLD BY THE JAY

EVERY THING NEW UNDER THE SUN.

In the years that I have kept bees I began to feel that there were just a few principles of the craft that I was certain of—that I knew a few things; but this spring sprung so many surprises on me that "I don't know" too. In a former article you will remember how I treated new swarms by hiving them with weak ones. Well, this year I expected to try the same thing; but what do you think? Nearly all of the swarms issued before the flow began. I have read how they do that in the South, but this was my first experience. I had only five swarms, and four of them were between apple-blossom and clover. I had 35 colonies in fine order for comb honey; and as all had two stories apiece there was little swarming.

Then the next thing that surprised me was the tremendous amount of pollen gathered during locust blossom. The bees just crammed every place full of pollen, some brood-frames being one solid mass of green, yellow, red, drab, brown, and white pollen. Sometimes they would fill a cell with pollen, and cap it over. Sometimes they would fill a cell half full, and the queen would lay an egg on top of it. I took away one story and put shallow extracting-frames on top with foundation; and as soon as they had the foundation drawn out enough they would pack pollen into it. I put on comb-honey supers, and they put pollen in the sections; but I was ready for them by this time. I put the extracting-frames on the hive and the sections on top of them; and when the bees came in with big loads that looked like walnuts (but some were smaller) they got tuckered out by the time they carried it up one flight of stairs, and stopped before getting to the sections. Now I hear some one say, "I told you so. You use the Danzenbaker hive." All right; howl away; and when you get through I have a small howl coming. I had five eight-frame Langstroth hives, and one of them was the worst of any in the bunch. It has been said that bees will not put pollen in drone comb. Mine do. Some of those large drone-cells had a wad of pollen in them big enough for a tumble-bug to play foot-ball with.

Now, the Danzenbaker hive has been roasted quite a little by the big gus because of the pollen in the sections. With me it is no worse than the Langstroth hive of same capacity; and every time I go after the bees in the Langstroth hives (I leave them alone all I can) it reminds me of transferring a swarm from a cracker-box or a nail-keg; and then to put the frames back, what a job! —burr-combs galore; bees smashed by the wholesale. I often wonder how any one can use the Hoffman frame when he can get the nice close-fitting Danzenbaker frames and do away with the burr-comb. Then when it comes to taking out the sections from the T super, all stuck up with warm propolis, it strings out and makes you think you are at a lady's-aid taffy-pulling.

Next came the wax-worm problem. I knew the worms would be in the honey on account of

the pollen, so I decided to fumigate. I put the supers in a tight little room and put in about two pounds of sulphur. There were some spiders and roaches in the room, and I wanted to get the whole bunch. My! what a smudge I did make! The next day I could hardly stand it in there with the doors and windows open. It killed two rose bushes on the outside, and made some beautiful autumn leaves on a grapevine ten feet away from the house. In fact, it seemed to kill every thing around except the wax-worms, roaches, and spiders. I could not see that the little smoker they enjoyed was in any way detrimental to their general health and prosperity. Next time I am going to try the carbon-bisulphide cure. They say it is explosive; so if you notice that Southern Indiana has a fit of the ague you will guess that another of my experiments has gone wrong.

It is said that the large wax-worm does not get in comb honey—just the little kind. Some of these were about two inches long, and about as big around as a lead-pencil. I guess I don't know what the large kind is. There has been a kind of thing crawling around my bee-lot that swallowed two of my pet toads. The boys call it a blue-racer. Is that one of the large kind?

Now I want to tell the other side. I had about 600 pounds of the finest white-clover honey you ever saw, that I sold to the grocers at 16 cts. per section. One man said: "That looks too good to be made by bees." He took a case. I also had about 500 lbs. of fine extracted honey that I sold in the new Shram self sealing glass jar, and it will hold honey without leaks too. I also increased up to 55 colonies, and gave the new ones abundant stores to start with.

## GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

AN ERROR CORRECTED.

Monsieur Bondonneau writes that I was in error in regard to the restarting of the Algerian bee-paper known as *Nahla*. As it is, one number is still gotten out each year to give the names of members of the bee-keepers' society of Algeria, also the officers and other necessary items of news. *L'Apiculture Nouvelle* is sent to each member in lieu of *Nahla*. As the number I received was the same old *Nahla*, I concluded it had been "playing possum," hence the mistake.

★  
LABELING HONEY.

There seems to be a misapprehension with regard to the intent of the national pure-food law as regards the proper labeling of honey. It is not necessary to state from what source the honey came. If, however, you state on the label "Pure clover honey" it must not be some other kind of honey. It must be clover or very largely from clover. You are not obliged to state what kind of clover the bees worked on to get it—it may be from alsike, white, crimson, sweet, red, mammoth, alfalfa, or any other true clover. You are not obliged to supply all particulars;

but what you do state on the label must be accurate, and not in the least misleading. You must not deceive the consumer.

#### SETTLERS ARE WANTED.

Uncle Sam wants settlers on irrigation projects. For the Salt River Valley project apply for further information to Louis C. Hill, Supervising Engineer, Phoenix, Arizona. For the Klamath project, in Oregon, apply to William H. Heileman, Engineer, Klamath Falls, Oregon. For the Truckee-Carson project, in Nevada, apply to Thomas H. Means, Engineer, Fallon, Nevada. For the Yuma, Arizona, project, apply to Francis L. Sellew, Engineer, Yuma, Arizona.

#### THE GLUCOSE QUESTION NOT DEAD.

The pure-food officials have an association of their own which they term Association of State and National Food and Dairy Departments. This year it had its convention at Mackinac Island, Michigan. Among other things which the meeting did was to pass a set of resolutions severely condemning Secretary of Agriculture Wilson for holding up the operation of the national pure-food law in certain cases. They do not blame President Roosevelt at all; in fact, the latter seems to blame Secretary Wilson for lending a too sympathetic ear to the wail of certain corporations. It is pretty plain, from all that has been said, that they had the glucose decision in mind, and they are not at all pleased at the outcome of it. In any case, a paper which is published by the glucose and whisky interests rushes to the defense of Mr. Wilson. It is evident the glucose decision will not be allowed to rest very long. The Association intends to have all the States pass a uniform pure-food law almost simultaneously. It will be more stringent than the national law.

#### EXPERIMENTS WITH BEES.

Lord Avebury, who presided over the Franco-British Congress of Bee-keepers in London, made a very interesting address on the subject of bees to the assembled bee-keepers. Of course, what he had to say was interesting because it was mostly original. When he was still Sir John Lubbock he issued his famous "Ants, Bees, and Wasps," which gained him much fame as a student of bee habits and life. His address was largely a continuation of that book, recounting his experiences with bees in trying to discover whether or not they hear or can distinguish colors.

On the latter subject his experiment was convincing. He said, "After the bees had returned twice I transposed the papers. She returned to the old spot, and was just going to alight when she observed the change in color, pulled herself up, and without a moment's hesitation darted off to the blue. No one who saw her at that moment could have had the slightest doubt about her perceiving the difference between the two colors." He also related his experiments with regard to bees hearing, but I do not believe his experiments are convincing. I do not doubt that bees hear. Anybody who has paid much attention to the piping of queens must have come to the conclusion that bees do hear. Otherwise

the piping would be useless, which is not likely. Bees do not care for the sounds we make. The sounds we produce are probably too coarse.

#### BEES ON THE HEATHER BLOOM.

This is the season of all seasons with many European bee-keepers, for the heath or heather is now in bloom, and thousands of bee-keepers have their apiaries located right in the midst of the bloom, the better to secure a crop of honey. For many of them it must be an arduous undertaking to send their bees quite a distance from home. But there is money in it. Some keep their hives on house-wagons all the year round, ready to move at a moment's notice. The German and Austrian wandering bee-keepers have a powerful organization of their own, protecting their interests.

We too might have something of the kind if we had the heather. No one seems to have the enterprise to introduce it. There are places on the Catskill and Shangunk Mountains where it might succeed if given a fair start. Probably in Western Oregon and Washington, in peaty marshes, it would stand a fair chance of succeeding, and possibly at high altitudes in the Rockies—that is to say, at 8000 feet and over, where the soil is peaty and the rainfall sufficient.

#### THE ALFALFA KING.

Not long ago a number of the agricultural journals of this country announced to the world that Mr. R. E. Smythe, of Sherman, Texas, was the alfalfa king of the world, with a total area of 1400 acres; but Mr. T. J. McKeon, of Argentina, in a letter to *Hoard's Dairymen*, very effectually disposes of that claim. He instances the record of General Julio A. Roca, twice president of the Argentine Republic, who has 192,000 acres in alfalfa, or 300 square miles. Messrs. Salaberry, Labor, and Bercetche, of Cordoba, have nearly 100,000 acres more, and La Germania Estancia Land Co. about 110,000. There are also many who own large areas planted in alfalfa far excelling the Texas man. Mr. McKeon himself claims to have ten times as much as Mr. Smythe, and is now putting down 4800 acres additional. This looks like great news for the bee-keepers, for in South America the cattle are allowed to graze on the alfalfa almost the year round. In Chili and Peru there are also vast areas set aside for alfalfa. As a matter of fact, the culture of alfalfa in this country is only in its infancy, and in time we shall see similar areas in this country, notably so in Texas and California.

#### ALFALFA IN THE TROPICS.

There is an impression abroad that alfalfa will not grow in the tropics; but as a matter of fact it grows to perfection in Peru, a strictly tropical country. It was from Peru the seed was introduced into the United States. But it rather likes a hot, dry, semi-arid country, and would probably succumb in a steaming, moist lowland country. The writer has seen it growing in Grenada, one of the most southern of the West India islands. The editor of the *Journal of the Jamaica Agricultural Society* thinks it would grow in Jamaica, if given a fair chance, and he is prob-

ably right. On a limestone formation it does best, as it has a liking for lime, and there are some places where every thing seems to be to its taste, and possibly there are such places in the Isle of Springs. In some of the "dry" islands of the West Indies it stands a fair chance of succeeding, more particularly at an elevation.

#### ALFALFA IN VIRGINIA.

The Old Dominion is coming forward to take its place among the alfalfa States. One farmer is putting down 1500 acres to it just as fast as he can get the land in the proper condition. He first plants the clean well-manured land to crimson clover and then to cow peas. After that follows a heavy application of lime. Planted on such a bed the alfalfa comes along at a great rate. In the judgment of experts it will yield as heavily as it does in Colorado or Montana. If this is so, and it seems to be absolutely true, it means a tremendous boost for old Virginia. The Wing brothers, of Mechanicsburg, Ohio, strongly urge all would-be growers of alfalfa in the South to apply lime heavily—as much as eight tons of ground lime per acre if financial circumstances permit. I imagine that, in so warm a climate, alfalfa will yield some honey.

---

## GENERAL CORRESPONDENCE

---

### IMPERIAL VALLEY, OF CALIFORNIA.

#### A Note of Warning to Those who Believe this a Bee-keeper's Paradise.

BY J. W. GEORGE.

W. K. M., page 894, July 15, has jumped at conclusions without making proper deductions. Perhaps a little write-up from one who is on the spot, and who is fully conversant with the actual conditions, might not be amiss just now.

Imperial Valley is *going* to be one of the greatest valleys in the United States. I will not take space to describe it minutely; but suffice it to say, it is a large basin below sea level, with a perfectly level surface, and is about fifty miles square, practically all susceptible of cultivation, and a portion of it is now under cultivation. Till a few years ago it was known as the Colorado desert. There is a considerable acreage in alfalfa, which helps the bee-man; but there is a limit to all good things. Let me sound a warning right here, and give a little history.

The real-estate men and the local newspapers have financially ruined many a man in this valley. This year they published and talked of the great profits in raising cantaloupes for the eastern market until people almost believed that dollars grew on cantaloupe-vines. The result was that hundreds of men planted cantaloupes, and harvested failures. Why? There were too many in the business—hundreds of men lost all they had. Now the local papers and real-estate men have taken up the honey cry, and it may bring about

the same result for bee-men. With that in view I will give you the actual facts and conditions as nearly as I can.

As closely as I can estimate, last year's crop was about two cases of extracted honey per colony. This year, indications are for a little better than one case per colony. Last year there were about three carloads of bees in the valley to gather the honey; this year there were 15 carloads of bees shipped into the valley, which makes a total of 18 carloads. Our crop will probably amount to 12 or 15 carloads of honey. I am not going to say that the increased number of bees is entirely responsible for the average reduction in yield per colony; yet there are some who think it is.

The country here that is sown to alfalfa in sufficient acreage to be profitable to the bee industry is all occupied. I would advise any one contemplating coming here with bees to make haste slowly. You had better come and look the situation over. However, don't think that the bee-keepers of Imperial Valley are hide-bound, and don't want other bee-men to live. Let me give you an instance to prove the contrary:

One of our fellow bee-men had his entire apiary (with the exception of two colonies) burned, fixtures and all. The bee-men of the valley donated from three to ten colonies each, and made for him a new apiary. They actually hauled the colonies to him, some of them coming as far as twelve miles.

We have an incorporated association for the purpose of marketing our honey and purchasing our supplies. Our officers are, D. D. Lawrence, General Manager; Directors, J. B. Whittaker, Henry Perkins, George Jenifer, Thomas Philip; J. W. George, President. Our secretary is a very busy man, having a large apiary of his own; still I think he would answer any question through the bee-papers that would be of interest to any one contemplating moving bees here.

One thing I did not mention—this is not a paradise to live in.

Imperial, Cal., July 25.

---

### SIX MONTHS OF WINTER.

#### Bees Confined for so Long a Period Need Good Stores and Good Ventilation; the Value of the Right Combination of Conditions.

BY H. H. ROOT.

In localities where the honey-flow is more or less continuous, or where there is usually a flow of good honey in the fall, it may be unwise to substitute sugar syrup for the winter supply of food. But in some cases the fall honey is not a proper winter food, or the winters may be very long, so that sugar syrup is the safest to use. Mr. C. F. Smith, of Sheboygan, Michigan, finds that the syrup gives him much more uniform results, owing to the length of the cold season, which averages about six months.

At the convention of the Northern Michigan Bee-keepers' Association, Mr. Smith gave some interesting data concerning his locality. The honey-flow begins about the 18th of June, and lasts only about thirty days, there being not

enough honey coming in during July and August to keep up brood-rearing. If no brood is reared after July it is easy to see that the colonies will not winter well, and that feeding must be resorted to soon after the natural flow ceases, in order to give the force of young bees necessary.

By so doing, the winter supply of food is also provided, although for merely keeping up brood-rearing a thinner syrup is fed than would be desirable for winter stores. When colonies of young bees are in hives containing plenty of good sugar syrup, and placed in a well-ventilated, all-underground cellar, they may be kept six months in good condition.

Mr. Smith, after losing a good many colonies, found that it paid him to remove the covers from the hives in the cellar. Two or three thicknesses of burlap are placed over the frames about a week before the colonies are put in the cellar, and then when the carrying-in is begun the covers are removed. The idea in this is to leave the bees in such condition that the moisture may have a chance to escape, and then it does not make so much difference whether the cellar is damp or dry.

If other conditions are right, the temperature of the cellar is also of less importance, for the bees are able to control their own temperature by the way they cluster. Bees closely clustered do not lose much heat.

These facts go to show that it is a combination of conditions that produces good results in wintering rather than any one condition alone. Some bee-keepers have found that darkness is essential, while others make no effort to exclude the light. Some have elaborate systems to provide ventilation, while others say that the ventilation is unnecessary. In some cases bottom-boards are removed, and in others they are left on, etc. Locality accounts for much of this difference of opinion, and the condition of the colonies and the quality of the stores account for more.

But it can not be denied that the right combination of conditions must exist in order that the bees be given a chance to take care of themselves. If the atmosphere of the cellar is damp, then the temperature must not go below 40° F., for dampness and cold are two conditions that should not exist at the same time. It is probable, also, that if the temperature is high enough to permit the bees to move about freely, the light should be excluded to keep them from becoming restless. Foul air should never be tolerated; and if the construction of the cellar is such that the air is not naturally changed, then ventilators must be used. A rapid change is not necessary, however, for if the bees are semi-dormant they need but little air. Colonies have been known to winter well in hives the entrances of which, by mistake, were left stuffed with rags. Ordinarily, if the bees become so restless as to require a mid-winter flight, then we should say that the combination of conditions is wrong.

As long as the bees keep quiet, the chances are all in favor of strong colonies in the spring. It is not so important to know how many colonies are still living when warm weather comes as it is to know how many colonies there are that will be in condition to "do business on the old stand" by the time the honey-flow begins.

## HOT OR COLD UNCAPPING-KNIVES.

### An Argument in Favor of Cold Knives; the Advantage of a Sharp Edge.

BY LESLIE BURR.

Whether an uncapping-knife should be hot or cold is a question that can not be answered by saying that one way is better than the other; but, as a rule, I think that the knife should be cold. This statement, I know, is not in accord with the views of many bee-keepers in the West and some other parts of the country, perhaps. In my mind, I can see the bee-keeper on the Pacific coast as he says, "Well, I should like to see you uncap sage honey with a cold knife;" but I should like to ask such a person when he ground his honey-knives last. His reply probably would be that the knives were ground some time last season.

To uncap honey the knife should be sharp and clean. If it has these two qualities, and is in the hand of a person who knows how, almost any kind of combs can be uncapped as fast as the largest extractor now made can extract them.

The way to uncap honey is to have two knives ground sharp and clean. The knife that is not in use should be placed in a pail of water, and when the knife that is in use becomes dull and gummy, after perhaps from half an hour to three hours' use, the time depending on the kind of combs, it should be changed for the other one. Each time the knives are changed a moment's time should be spent on the blade with a whetstone. Not only should the edge be brushed up, but the whole blade should be gone over to remove the gummy coating that has formed, for it is this gummy coating that causes most of the trouble.

Of course, there is honey that can not be uncapped with a cold knife, but it is not honey that has been recently gathered. I have yet to see honey that has just been gathered that can not be uncapped with a cold knife.

And now as to the way to cut the combs. Only the upper edge of the knife should be sharp; the lower edge should be dull, so that it may be used for trimming the wax off the top-bar. Do not uncap with a sawing motion unless the comb happens to be an old black one that can not be uncapped otherwise. A draw cut is much faster and smoother.

The advantages of working with a cold knife are many. No oil-lamp is needed to heat up the extracting-house, and possibly set fire to it; there is no changing of knives every comb, and, last of all, more work can be done and with much less bother.

Valparaiso, Indiana.

#### IN FAVOR OF A COLD UNCAPPING-KNIFE.

I have used uncapping-knives for ten years, and I like the cold knife best. The edge, however, must be keen and polished, and the honey warm enough to run freely. Half the trouble comes from a stained and rust-spotted knife.

Marion, N. Y.

J. A. CRANE.

[We should be glad to hear from others on this question of hot and cold knife.—E.D.]

## STAYING FULL SHEETS OF FOUNDATION.

**Both Wires and Splints Used;  
Some Cases where Splints  
were Not Satisfactory.**

BY E. F. ATWATER.

*Mr. Editor:*—Your request for reports from those who have used a combination of splints and vertical wiring prompts me to give my experience, so I enclose three photos illustrating some of the results of the use of splints to prevent sagging of full sheets of foundation. In Fig. 1 we have two frames, the upper one having the foundation supported by two wires and four splints; the lower frame has three wires and two splints, the latter being a fair representative of several thousand frames which we are putting in use this summer, except that we are using mostly Hoffman frames, while those shown in the cuts are plain, with staples at the bottom, according to the Coggshall plan. We tested a few splints in previous years, but were not fully satisfied with the results. However, since inventing and using our combined wax spoon and brush described on p. 1590, Dec. 15th, last year, we decided to give them a thorough trial this summer, as, with this little implement, we can give the splints an extra coating of wax after they are imbedded in the sheet of foundation. You will note in Fig. 1 that both splints and wires are waxed. Early in June we hived a lot of swarms, mostly shaken or "tubed," on such frames. In perhaps two-thirds of the hives, results were all that could be desired; but in some we found all (or nearly all) of the combs in the condition shown in Fig. 2. The bees are likely to begin gnawing at the splints at or near the lower ends; and when this happens they don't know when or where to stop, short of the actual removal of at least the lower half of the splint. In Fig. 3 we see plainly just where the splints have been gnawed out of the foundation, and how the bees are inclined to fill the vacant spaces with drone and irregular transition cells.

What can we do about it to prevent bad results? First, if we have a bee-space under the lower edge of the sheet of foundation we can use splints only six inches long, putting them in so that they reach within two inches of the bottom of the sheet of foundation. Or we can do as I did with a lot of frames—we can use common wooden toothpicks instead of the long splints. But I hope to solve the problem in another way, namely, to coat the splints with some substance (possibly shellac) that will

render them hard and smooth, so that the bees will have no chance to pull and cut at the fiber of the wood. Mr. Thos. Chantry has used stiff wire, like knitting-needles, but these

FIG. 1.—ATWATER'S METHOD OF USING BOTH WIRES AND SPLINTS.

In the upper frame there are two wires and four splints; in the lower, three wires and two splints.

FIG. 2.—IN SOME CASES WOODEN SPLINTS ARE GNAWED BY THE BEES.

FIG. 3.—SPLINTS GNAWED AWAY, MAKING THE COMB DEFECTIVE.

APIARY OF E. H. JAMES, CAIRO, ILL.

This yard is located in the suburbs of a city which is between two large rivers. A crop of honey is secured each year.

are too expensive. Let's improve the details of the splint method until it gives good results all the time.

Meridian, Idaho.

[Figs. 2 and 3 do not give one a favorable impression of wood splints; but we are prepared to say in this connection that we saw nothing of this kind at Dr. C. C. Miller's apiary. He showed us comb after comb built from foundation stayed with wood splints, and these combs were as flat as a board, without any suggestion of wooden stays in the midrib; and, what is more, they were filled out to and in contact with the bottom-bar. One strong claim made by Dr. Miller for splints is that, by means of them, one can use sheets of foundation reaching clear down to the bottom-bar. Here, evidently, we have a case where locality affects results or else Mr. Atwater does not work the plan right. Dr. Miller is respectfully called upon to show why a third of the combs look like Figs. 2 and 3.]

Years ago we used folded tinned bars to stay our combs, and we had many that looked like Figs. 2 and 3, with this difference, that we had only one stay or bar.—ED.]

## AN APIARY BETWEEN TWO RIVERS.

BY E. H. JAMES.

Ten years ago I started with two stands of bees—one box and one frame hive, with the intention of increasing the number if the location would permit. I am in the suburbs of the city, between two broad rivers which almost surround the town, thus making the territory for bees comparatively small. To my surprise the increase in my apiary has been steady, and I have never failed to have an excellent surplus of honey.

My apiary at present consists of 48 colonies,

and this season, up to July 25, I took 1000 pounds of comb honey, which has been sold readily at 15 cts. per pound in the city.

My hive-stands are pine pieces, 4 inches square and 3 feet long, there being two hives on a stand. For shade-boards I use any kind of broad planks, weighting them down with rocks.

The high board fence has prevented people from being annoyed by the bees, thus avoiding trouble with neighbors.

The time given to the bees has been after working hours, my occupation being an engineer. I get two crops of honey a year, the fall flow being the larger.

Cairo, Ill.

[We desire to call attention to the importance of a high tight-board fence to inclose a bee-yard in or near town. A good hedge fence of willow or osage orange would do just as well. At all events, the bees should be made to fly high before they leave the premises. In this way they avoid coming in contact with pedestrians or horses.—ED.]

## BEE-KEEPING AND TRUCK-FARMING IN COLORADO.

Snap-shots from Grand Valley.

BY R. D. TAIT.

I don't remember ever seeing in GLEANINGS a picture of an apiary in this valley. I send two views, one of our small yard of bees and the other showing how we dispose of our honey. Our farm consists of five acres, all of which is in truck, and one can get some idea of the productiveness of our soil by the picture, showing the onions, cauliflower, etc., which are raised among asparagus, set out this year—onions and cauliflower coming off in time to give the young

asparagus time to develop thoroughly, and harden before cold weather.

The truck-growers in the East can hardly realize the possibilities of an acre of our soil in this valley, with plenty of water and sunshine; but they can get some idea of it from the picture of our market-wagon, which goes into Grand Junction three to five times a week with honey and vegetables, etc. My wife drives the horse while I go in and sell the goods. We carry a first-class article, and get a first-class retail price.

We run for comb honey only, but have some extracted or chunk for certain customers. We try to have just what they want, and have no trouble in disposing of all the honey and vegetables we can produce.

Grand Junction, Colorado.

[The great majority of our bee-keepers (perhaps 90 per cent) run their bees in connection with some other business, and it is well that they do. In some localities the seasons for many are very uncertain. When it is good, there is a rich harvest.

TAIT'S HONEY AND VEGETABLE MARKET-WAGON.

On the principle that it is not wise to put all the eggs in one basket, we advise the majority of producers to run their bees in connection with some profession or business. Bee culture on a small scale works admirably with any one of the professions. It goes well with fruit-growing, truck-growing, or poultry-keeping. Our corre-

FIG. 1.—A FAIR SAMPLE OF HOW CAUCASIANS BUILT BRACE-COMBS BETWEEN THE TOP-BARS DURING A GOOD HONEY-FLOW.

spondent, Mr. Tait, is sure of making something every year.

He is one of the bee-keepers we feel like commending, because he sells his honey and his vegetables direct to the consumer, thus relieving the congestion at our great market centers.—Ed.]

## A HONEYSUCKLE ARBOR FOR SHADE.

BY L. C. EBRITO.

I am sending you a picture of a model Texas apiary. Some bee-men in the North object to a dense shade; but I think it is all right in the South. My bee-arbor is 8×88 ft., and is covered with honeysuckle. At the front end the rafters are hiped, and extend about 12 ft. high. On these I have four monthly running roses, two of them being Marshal Neils. The peach-tree hides that part of the arbor to some extent.

There is plenty of room under my arbor for 72 colonies, but I have only 57. The little house at the extreme right is my shop. It is connected with the arbor with frame work covered with vines, so I have shade going to and from my bees. My hives face the north and south.

I never used full sheets of foundation until this summer. I made a tool for imbedding the wire,

which I think does the work well. I took a large crooked sewing-awl, and with a very fine three-cornered file I cut a groove from near the point back, some  $\frac{3}{8}$  of an inch. I draw the awl along with the wire in the groove, making, in my judgment, a good job of imbedding.

Mesquite, Tex.

[It is the almost universal custom for the bee-keepers of Arizona to arrange their hives in two parallel rows on 2 by 4's with an east-and-west shed over them as shown here. As Mr. Ebrito says, it is almost a necessity to use some sort of shade in a hot climate, and something of this kind is ideal. By having a shed of rank-growing vines as here shown, running east and west, the sun can not get to the hives as the day advances. It can strike them only in front. The further south the apiary, the more nearly the sun will be overhead, and the less it will strike the hive-fronts. In the morning it will strike the east end of the shed, and in the evening the west end. But at neither time of the day is the heat intense.

In Arizona, where the bee-keepers have a shed on this principle, it is of simpler design, with a sort of dry brush, grass, or weeds, piled on top and held there by wires drawn over the whole.

There will be nothing to prevent one in the North Central States from adopting a similar shed. By this arrangement one can have an apiary that will enable him to work with comfort

out of the flight of bees and under cover where cross bees are not likely to go.

We have had an enlarged view made of this bee-yard because we respectfully commend the general plan of it to our readers as a whole, in either the North or South.

We wish to suggest in this connection that a sort of trolley wire or cable could be drawn taut on a central line over each row of hives, and secured by posts at each end. A grooved pulley with a small tackle would then enable one to lift the supers off the hives, hold them in midair, or push them anywhere on the trolley, clear up to the extreme end, where they may be deposited on a wheelbarrow.

The arrangement of hive-stands, also, is very simple, and has the further advantage that it permits the apiarist to push his toes or insteps clear under the hive. This allows him to get near his work.—ED.]

### CAUCASIANS, AND THEIR DISPOSITION TO BUILD BRACE-COMBS.

BY E. R. ROOT.

On page 870, July 1, we referred to the tendency of Caucasians to build brace-combs excessively. We promised to furnish a photo, and here are two of them, showing the tops of two of the hives that were fair samples. While we occasionally find Italian colonies that build comb almost as bad as this, they are the exception.

As our readers will recall, we had 35 Caucasian and 35 Italian colonies at this yard. When

we opened the hives of the dark bees we were almost sure to find brace-combs like those shown here. Of course, there were exceptions, both among the Italians and the Caucasians. But we are speaking only of the characteristics of the two races as we found them at this yard during a good flow of honey.

But not only were there brace-combs between the *top-bars* of the Caucasian colonies, but they were built through the center of the brood-nest to an extent that in some cases made it difficult to spread the combs, because they were so tightly stayed by means of these spurs.

### THE GROWTH OF A BEE-KEEPER.

#### How a Sickly Boy Battled with Disease and Finally Became an Extensive Producer of Comb Honey.

BY ALLEN S. HOWDEN, HIS FATHER.

[The following account of how a sickly boy, pronounced incurable by eminent doctors and surgeons, began to mend after he started to keep bees, so that he is now a strong hearty man able to produce a carload of comb honey in a season, is exceedingly interesting. His pluck and ambition to get well and become one of the most extensive bee-keepers of his State will prove encouraging and helpful to some other boy or girl, perhaps handicapped by a frail body. The hero of this sketch has our hearty congratulations.—ED.]

It may be of interest to some of the readers of GLEANINGS to hear something of the progress of one bee-man, and of the growth of his business, which is now the largest in Allegany Co., N. Y. As his early history has never appeared in print

FIG. 2.—ANOTHER SAMPLE OF THE SAME THING SHOWN IN FIG. 1.

I feel as though my letter would be more complete if I were to go back a little.

When Leon F. Howden was four years of age he fell from a chair on a hard floor and sustained a bruise on the hip which caused blood-poisoning and a psoas abscess, and, later, diseased bone beneath it. When he was taken down with this trouble he was a fat, rugged boy, and weighed 50 pounds. The abscess was not properly drained at the start, and the blood soon conveyed puss to other parts of his body until other abscesses of like nature appeared one at a time for a period of

COVEYOU'S AGITATOR FOR HONEY-HEATING TANKS; SEE PAGE 1067, SEPT. 1.

The movement of the parts in opposite directions causes the honey to circulate freely, so that the whole mass is kept at the same temperature.

two years, until he had had twelve of them in all. Several of them were so deep-seated that, while they were gathering, they caused an unusually high temperature, and some even started on the bone, not healing for months, and then only when pieces of bone had been discharged through the openings.

Many noted doctors and surgeons of the country pronounced the boy incurable. He underwent seven operations at his home, some of which were of two hours' duration. When he had improved a little, but before he was able to walk

again, his parents took him in their arms and went by train to Rochester to consult Dr. E. M. Moore, at that time an old, white-haired, feeble man, but one who had been one of the greatest surgeons known in Western New York. At that time Dr. Moore said the only thing to do was to get that dead bone out of the boy's hip. If it couldn't be done at one operation, another trial should be made. He was brought back home without the operation at that time, but was later operated upon by a son of the former surgeon. At this time Leon was away from home, and was in the hospital bed two weeks. He was in the General Hospital in Buffalo two weeks at a time, two different times, and each time was operated on. He took chloroform twelve times in all.

When he commenced to gain, his weight was 25 pounds; and at 15 years of age he was sickly and far from being able to work on the farm with his father and brothers. It happened, however, that a near relative was about to go out of the bee business, having 24 colonies of bees in good double-walled hives. These were bought by his father, with 50 good empty hives, for \$40.00. Because of Leon's condition they were brought home and turned over to him for his own. In a short time he showed an unmistakable interest in the bees, and his parents were sure that he would be successful with them if he had the strength to take care of them. He soon had a copy of the *A B C of Bee Culture*, and a little later subscribed for *GLEANINGS*. His mother says that it always brings a smile to Leon's face when he comes in and finds on the stand a new *GLEANINGS*.

Well, he kept improving in health until the last thing to do was to have a piece of skin the size of a silver dollar taken from one of his limbs and grafted on to a sore that would not heal, which was on the other limb, just above the ankle. Now he is 20 years of age, standing by his bench near his oil-stove in his honey-room folding sections and putting in foundation at the rate of over a thousand a day. In one day recently he put together 40 honey-boards of 33 pieces each, driving 90 nails in each board. From the little fever-burned boy of 25 pounds he now tips the scales at 160, weighing the most of any one person in the whole Howden families. He is hearty and strong, and always wants a good big chunk of candied honey near his plate at meal time. Last season he sold nearly a full carload of good to fancy comb honey; besides that, he extracted and sold to his friends and neighbors 12,000 pounds. He has 250 colonies of bees. Leon aspires to be the greatest producer of fancy comb honey in the State.

Fillmore, N. Y.

## THE PLURAL-QUEEN SYSTEM.

### Is it Profitable for Bee-keepers to Practice it?

BY E. W. ALEXANDER.

[The following article was written last March; but as we had already decided to suspend further discussion on the plural-queen subject for the time being, or until the following fall, we have held it until now. It is not our purpose to reopen the discussion if it is not desirable; but as Mr. Alexander will probably never be able to write another article, on account of his health, we are placing this before our readers at this time. We suggest that it be given a careful and unprejudiced reading by those who may be opposed to the practice. Observe he does not urge it for all seasons and all conditions.—ED.]

It is now about 18 months since this new method of bee-keeping dropped into our camp like a bombshell. During this time I have had but little to say as to its merits or demerits. Some endorsed it at once as another forward step, while others were ready to condemn it from the first. It is now of a proper age to bear some fruits whereby it will be known. It is only natural that I should be anxious to hear from others in regard to the results derived from this system. Like many other improvements it has come to stay, and will be adopted in some ways by intelligent bee-keepers as long as bees are kept by man.

In making our increase it has, in connection with the nuclei system, enabled us to make more increase with less expense and trouble than has ever been made before. In forming nuclei heretofore, we have taken two or three frames of brood and honey with adhering bees, and, after putting them into an empty hive, set them off to one side, shut the bees up two or three days, and then given them a queen-cell, a virgin queen, or a laying one, and left them to build up into a colony of proper weight and strength for winter, not expecting and seldom securing any surplus from them.

But how different now! All that is necessary is to form our nucleus over a queen-excluder on any colony of medium strength, and the next day introduce a laying queen to the nucleus; then in about 25 days the hives can be separated. Each hive will be full of bees and maturing brood; then move the lower hive a little to one side, and set the upper hive alongside so about an equal number of the working force will enter each hive.

Here you now have two good strong colonies in the place of one. Each has its laying queen, its hive filled with brood, and a good working force of bees. There has been no chilled or starved brood.

This, you will find, is the surest and best method that has ever been practiced in order to make a large increase in time for our early harvest. This one advantage of itself, which is easily secured by a plurality of queens in a colony is worth hundreds of colonies and tons of honey to the extensive honey-producer.

I am sorry to see men of experience in our business condemn new methods before they have given them due consideration. There are certain seasons of the year and certain conditions a colony can be in when a plurality of queens is of no particular benefit; but because this is so, it is no proof but that at other seasons, and under other conditions, a plurality of queens in a colony is a great help. There seems to be a tendency on the

part of some bee-keepers to belittle this idea, and make it appear of little value. This we must expect. It has always been so—one class trying to pull down every thing of an advanced nature, while others are trying to build up. This whole question, like many others connected with our business, must turn entirely on this one point—does it pay? If it pays to check the desire to swarm in very strong colonies, then on that point it does pay. If it is to our advantage to have unusually strong colonies just before our main harvest for surplus, then it pays on that point. If there is any gain in superseding our undesirable queens without an hour of lost time in egg-laying, then on that point it pays. If it pays to have strong full colonies to put away into their winter quarters, then it pays to have a plurality of queens in your hives during the latter part of brood-rearing. If it is worth any thing to have a surplus of laying queens four months of the season, so if one is accidentally killed, or you find a queenless colony, you have a plenty to take her place, then it pays to have a plurality of queens in some of your colonies. If it pays to rear your queens instead of buying them, then certainly it pays to rear several in one colony instead of only one. If it pays to double the number of our colonies before our early harvest, and have each one full and as strong in working force as one-half the number would have been had we not practiced this new system, then surely on that point it pays.

Yes, my friends, this idea has come to stay; and as the years go by there will be many advantages derived from it that we little dream of now. I think this new departure from the old rut of the past has already borne some very good fruit considering its age, and the fact that it was an unwelcome visitor from the first with some. I hope that many of our most experienced honey-producers will give this subject a fair trial the coming season, and then when we have heard their verdict we will let this subject rest.

Delanson, N. Y.

## GETTING RID OF OLD BEES FOR WINTER.

BY F. H. CRENIUS.

For a number of years I have wintered only young bees in many hives, with satisfying results. The plan is, to move the hive to a new stand at the close of the honey harvest in the fall, which with me is about Sept. 20.

The first experiment, more than ten years ago, was made by removing one of two hives, standing side by side, to a new place in the bee-yard. The remaining hive received all the old bees from the hive removed. In January I made an examination and found 22 dead bees on the bottom-board of the removed hive, and about a quart on the bottom-board of the hive that gave shelter to the old bees of both hives.

I have tried the experiment many times with about the same results. I reason this way—that those old bees are needed no longer, and are only a detriment. They can be of no use until next spring, and they are all dead before that time. The time we want bees is about two weeks after they begin to breed up in the spring;

and it is easily seen that a few times flying at that time will take them all.

Then, again, those old bees become more or less restless; and dying, as they do, they must disturb the colony more or less. Is it cruel thus to treat them after their days of usefulness are past? I have always furnished them shelter, only to find them soon with the great majority.

#### TIME TO MOVE.

This will depend on locality and conditions. I should say, as soon as they are no longer needed at this season. Do not wait until too late, because you might lose some that would be of use in very early spring; but every bee-keeper knows his bees are at the weakest point just before the spring brood begins to hatch, and it is safe to say every bee that gathered honey the season previous has long been dead.

Oswego, N. Y., Aug. 7.

[At first thought this may seem like rank heresy, but we are not sure but there may be something in it. We do know that, if a hive has nothing but old bees, it will be numbered among the dead next spring.—ED.]

## HEADS OF GRAIN FROM DIFFERENT FIELDS

#### PROTECTION OF BOTTOM-BOARDS IN COLD WEATHER.

After having read the article on page 98, Jan. 15, by Joseph Rose, on double bottom-boards, I wish to show the board (see illustration) I used under fourteen stands in the winter of 1906. I had to take my hives off all these boards in the latter part of January to save the bees, as fully one-third of each colony were dead, the dead bees being mostly on the upper bottom-board, and at the sides of the hive inside.

A DOUBLE BOTTOM-BOARD TRIED AND FOUND WANTING.

I used three-story alternating hives, top story chaff, and hives all well protected outside with excelsior and outer casing. When they quit work at the close of the season they had arranged their winter brood-nests to their own liking.

When I placed this bottom-board with an open-

ing clear to the back of the hive I simply disarranged the whole work the bees had been weeks in planning; and had I left it till spring I should have lost most of the colonies. The cold air passing through under the bottom-board had kept the upper board cold, and driven the bees up into the cold combs of honey. It served me right for interfering with their plans.

But the past winter of 1907 I left the summer bottom-board sealed just as the bees had fixed it, and slipped an extra board under, making a dead-air space between the two. I then placed the hives in some large thin cracker-boxes and set them on about four inches of dry hay, leaving the front of the boxes all open, facing the east. I crowded excelsior in between the sides of the boxes and the hives, and placed supers on the hives partly filled with leaves.

I have never had bees come through in finer condition. In the middle of January I tried to clean out the bottom of the hives with a wire; and as it was a very cold day I was sure I would have no trouble. But I had trouble just the same. Every hive I looked into had the bottom-board covered solid with live warm bees, and not a dead bee could I find. The bottom-boards covered with warm lively bees in mid-winter, and plenty of honey above, looked good to me, and convinced me that we should be sure that the bottom is well protected and warm, as well as the top of the hive. I did not find a moldy or damp frame this spring, but all were dry, with plenty of honey and bees. C. B. PALMER.

Bradshaw, Neb.

[We may explain to our readers that on p. 98, Jan. 15, we illustrated a bottom-board made on very much the same principle as the one here shown, and which proved to be so unsatisfactory in the hands of Mr. Palmer.

It will be remembered that the final results of our obstructing all the sunlight from the entrances of our hives by a lean-to board, storm-door, or other device, were somewhat in doubt. Apparently, early in the fall it prevented bees from flying out on cool days and thus becoming chilled, never to return. We are not sure but that colonies without the storm-doors were in almost as good condition as those with them.

We believe our correspondent is right, however, in urging the importance of a warm bottom-board, against which the bees may cluster and not get chilled.—ED.]

#### BEES LOST FROM SUPERS THAT ARE TAKEN AWAY BEFORE THE BEES ARE OUT.

Referring to your request, page 701, June 1, I will say that, in 1907, I took one super off with all the bees on the extracting-combs, as advised in a book on bees, and for experiment I took them to my laboratory, nearly 700 feet away, where I brushed all the frames, one by one, clean of bees, and placed them where bees could not gain access to them. The bees flew around as if lost. Some strangers or robbers came in and out; but the bulk of them settled down in little bunches, of which I carried back to the hive a great many, and those left in or out of the laboratory died.

JOAQUIN PEREZ Y PEREZ.

Monovar, Spain, Aug. 11.

## USING A ROOFING PAPER FOR A QUILT.

After reading the article on page 936, Aug. 1, on hive cloth, I concluded to tell your readers of a cheap and substantial cloth or cover. I have always used a cloth, the main reason for doing so being that it is a protection against robbing, for it makes an additional cover, and a good thing where the top cover is warped.

I have used the glazed oilcloth, and have used floor-cloth; but in removing them the paint would peel off, and the bees soon gnaw holes in them. Last spring, having a roofing-paper called "Buckskin rubber roofing," which contained no tar, I concluded to try it. I find it does well. The bees won't touch it. It can be removed easily, and it will last for years.

The Buckskin rubber roofing comes in three grades. I use the two-ply, which costs \$1.80 per roll in St. Louis. It is 32 inches wide, and will make 48 covers for ten-frame hives, making the cost 4 cts. each. A READER.

## HOW TO PUT ON BEE-ESCAPES.

Mr. F. G. Marbach's suggestion, p. 929, Aug. 1, is good; but why saw off the honey-board? Just use a stick  $\frac{1}{2}$  inch by the thickness of the honey-board under one end of the hive. It does not matter if the escape-board sticks out  $\frac{1}{2}$  inch, as it is not on the hive very long.

ANDREW C. BROVALD.

Babcock, Wis., Aug. 11.

[Yes; and by prying up the rear end of the hive after the escape-board is in place, the stick could be removed, to be used at the next hive.—ED.]

## MOVING BEES; USING AN EMPTY SMOKER TO INCREASE THE CIRCULATION; UNITING COLONIES.

When moving bees I use a wire screen in place of the cover. I make the frame for these of 1×1-inch material, 14 inches wide, and 20 long, for eight-frame L. hives. On this I tack the wire screen. Four six-penny nails hold it to the hive. I never drive them to the head, but leave room for the claw of the hammer.

For the entrance I use a piece of pine,  $\frac{3}{8}$ ×2, and 14 long. In one edge I cut a notch  $\frac{1}{2}$ ×3, over which I tack a strip of wire cloth, one side having the selvage. This is readily adjusted to the hive, and held by a small nail in each end.

In loading I leave room for the hand, at least between the entrances of every two hives, although enough room for the smoker would be better. When my hives are loaded on the vehicle I clean out the smoker—even the dust; for on the road I use it without fire to give the bees pure air. When a hive begins to get hot I blow out the heated air. A little water sprinkled on them with a brush is good; but very little of it should be used. With all of this precaution, and even if the bees do not warm up, some combs will break down. New combs full of brood are difficult to handle. If you put on a super you may save the bees, even if the combs break below. When uniting colonies I take this wire screen and turn it bottom upward. I cut a notch for an entrance, under which I tack on something for an alighting-board. I take the cover off one of the hives

to be united, and put the screen on. Over this I put a super, and then transfer the bees from the other hive into this super. In two days I draw out the screen.

T. ARCHIBALD.

Los Angeles, Cal.

## BEES BALL A QUEEN RETURNING FROM MATING-FLIGHT.

On a frame of my own make I placed a lot of cells dipped on the Doolittle plan, and grafted them with larvæ from my best queen. I then gave the frame to a colony that was building swarm-cells, after cutting out all these swarming-cells found in the hive. The bees finished 18 good cells out of the lot. Ten days after I grafted the cells I formed nuclei by taking a frame of brood with adhering bees. I placed the queen-cells in cell-protectors and stuck one protector on each comb of brood. Then I put each frame in a hive and kept the hive closed for two days. From every cell a nice large queen hatched, which mated all right, and all are now at the head of fast-increasing families. I watched the queens very closely from the fourth to the seventh day after the cells hatched, especially for about two hours right after dinner. In two cases the bees balled the queen as soon as she came back in the hive after mating. They tore the front leg from one queen before I got her away. I put the ball of bees in a tub of water, and fished the queen out after they had separated, put her in an introducing-cage, and let the bees eat her out. Both queens have turned out well.

I wonder if trouble of this kind is not one of the principal reasons why a good many queens are lost in mating.

P. W. HAMILTON.

Meadville, Pa.

[Yes, sometimes.—ED.]

## CUSTOMERS DEMAND THE SMALLEST AMOUNT OF FOUNDATION.

On page 934, Aug. 1, we notice the communication from Mr. Hand in which he states that it is "the appearance that makes quick sales." We wish we had his customers to deal with. We have to use as little foundation as possible.

H. G. ALLEN.

San Andreas, Cal., Aug. 22.

## VESTIBULED BOTTOM-BOARDS.

On page 98, Jan. 15, Mr. Rose describes his double-bottom-board arrangement, and you ask your readers to test it and report. I would say that I have tested the principle on about 20 colonies, both summer and winter, for we used chaff hives.

I had about fifty ten-frame Quinby chaff hives that I wanted to change to Langstroth dimensions. The Quinby frame is  $\frac{7}{8}$  inch longer than the Langstroth, so a  $\frac{3}{8}$ -inch board was nailed across the back end of the hive, shortening it to the right length for the L. frames. But the hive was still about two inches too deep; and to overcome this, two  $\frac{7}{8}$ -inch-square sticks were nailed lengthwise of the hive on the bottom, and on each side. Across these, commencing at the front, were nailed  $\frac{7}{8}$ -inch boards which covered the bottom of the hive except at the back end, where enough was left open to provide an

entrance from the lower part, or vestibule, up into the hive proper. These were used two seasons, both winter and summer, with good success; but as we were then transferring all our bees from chaff hives, they were not used any longer. I am sure it is a very good idea, especially for chaff hives and outdoor wintering.

Kemus, Mich.

E. D. TOWNSEND.

#### SHINGLES ON TOP OF ORDINARY COVER.

On page 551, May 1, Doolittle says that single-walled hives in the sun need a shade-board. I agree with him; but the shade-board I use is a shingled roof. If one uses them one summer and winter, he will never do without them. In the first place I nail a 3-inch board on top of my cover in the center, then I nail another piece  $1\frac{1}{2}$  inches wide, on each side of the center board, about half way between the center and outside. Before I shingle I nail a board across the end, the same slant as the roof, to keep the snow and the storms from blowing in. After the cover is about finished I nail a board on top of the roof, one on each side, letting it come down low enough to cover up the shingle-nails.

This cover never blows off, always keeps the hive dry, cool in the hot sun, and warm in winter.

ter. The shingles should project  $1\frac{1}{2}$  inches, and 2 inches over the sides.

Drygoods-boxes at 5 cts. each furnish enough half-inch boards to finish eight or ten hives.

Albion, Pa.

JOHN W. KIDDER.

[The shingle roof here shown would be very good; but we may here point out that our artist got too many shingles for the size of the hive-cover, which, on top of an eight-frame hive, is  $20 \times 13\frac{1}{8}$ . This would call for only one row of shingles on each side, the shingles, of course, to overlap and break joints.

It would be our opinion that this would be a very expensive roof unless shingles are cheaper than in most localities. Material that one can get out of a drygoods-box cover, with cheap roofing-paper, would give just as good results, and be almost as durable.—Ed.]

#### HOW TO REMOVE SECTIONS FROM SHIPPING-CASES; A SUGGESTION TO RETAILERS.

The proper way to take sections or combs of honey out of cases is to remove part of the back side of the cover and all of the back side of the case, and tip off the sections from the back side,

leaving the front or glass side intact, and making a good show. In this way you don't have to pull the sections any, which, if pulled, are often broken and the honey lost, especially if the bottom of the section has the least drainage or is at all stuck to the bottom of the case. By leaving the front or glass side intact it shows up well until the last row is sold, while if the sections are pulled or lifted out of the front or center, many sections are broken, and the case of honey looks ragged and unsightly. I have seen careless grocery boys nearly ruin a case of honey by pulling sections promiscuously from cases, tearing off several tops of sections before releasing one. This suggestion, placed in every case of honey, would instruct grocers and retail dealers to their profit, to the better satisfaction in dealing in honey.

There should always be a glass front to every case of honey, for two reasons: First, to show freight-handlers that it is glass, and fragile; second, to show the honey in the grocery, and yet protect it from dust and vermin.

Albany, N. Y.

H. R. WRIGHT.

#### TWO QUESTIONS.

1. In the December issue, page 1586, Mr. J. E. Hand says, "Until time to put on supers, when she is promptly killed." Does this mean that the young queen will naturally kill the old queen, or that the apiarist will kill the old queen?

2. On page 1582 Mr. J. E. Chambers speaks of removing the board, so that "the colony, now grown very powerful, is all together." Does this mean to remove the board without any excluder of any kind between two queens to separate them or not?

S. D. GARABEDIAN.

Defender, Cal., June 13.

[1. In this case Mr. Hand evidently means that the apiarist should kill the old queen. If the queens were left, and if they fought, it might not always be the old queen that would be killed.

2. We believe that Mr. Chambers does not leave even an excluder to keep the two queens apart. He explained, in a part of his article not published, that when he desires to save both queens he divides the colony later, putting a part of the bees and one queen on a new stand.—Ed.]

#### SYRUP THAT CRYSTALLIZES SLOWLY.

If labels are put on with thick syrup they will not come off from glass, tin, or other smooth surfaces. We often use it to put labels on ointment-boxes in the drugstore.

I have often wondered why I do not see mention made of the way druggists make syrup by percolation. They fill a funnel, can, or barrel nearly full of sugar, then pour water on it, and the finest kind of syrup runs off, which is slow to crystallize at the temperature at which it is made, and, if thinned a little with water, it will stay fluid indefinitely.

A. F. BONNEY.

Buck Grove, Iowa, March 24.

[Some years ago there was considerable said about syrup made by the percolating process, and many experiments were made; but it was finally decided that syrup made by mixing sugar and water cold, in equal proportions, and stirring well, was just as good as that made by the percolating process.—Ed.]

SELLING HONEY AROUND HOME; A SURPLUS OF  
QUEENS SAFELY WINTERED WHEN SEPARATED  
BY QUEEN-EXCLUDING ZINC.

I never need to leave the house to sell the honey that I get from my 38 colonies. People come and get it in pails, churns, kegs, and any thing that will hold it. I keep pure Italian bees of the red-clover strain, and they appear to work red clover as well as white, except when there has been a very wet spell, when I get the bulk of my honey from goldenrod. This honey is very light, almost like that from white clover.

I winter two and three queens in a hive with excluders to keep them separate, and have had no trouble so far; but, of course, I have done this on only a small scale. D. L. ANDERSON.

Flandreau, N. D.

DECIDING WHETHER A VIRGIN QUEEN IS PRESENT  
BY GIVING YOUNG BROOD TO THE NUCLEUS.

If we should follow the advice given on page 867, July 15, we should lose all our virgin queens. When we give unsealed brood to a nucleus with a virgin queen, in every case the queen is killed and cells are started at once. Our advice is to give nothing but sealed brood to a nucleus with a virgin queen. F. W. DEAN.

New Milford, Pa.

[If you will refer again to page 867 you will see that the giving of unsealed brood was for the purpose of determining whether the nucleus that was supposed to have a virgin was queenless or not.

But the giving of such unsealed brood *might*, in rare cases, be the death of an introduced virgin. But our queen-breeder, Mr. Pritchard, who will rear two thousand queens this season, says he often gives unsealed brood to colonies with virgin queens and has no trouble.—ED.]

MAKING INCREASE ON THE SOMERFORD PLAN; A  
GOOD SUGGESTION.

Mr. E. D. Townsend, in his description of the Somerford plan of making increase, p. 577, tells us to prepare a hive by nailing a lath over the entrance and boring a  $\frac{3}{8}$ -inch hole in the lath, which is stopped with a cork which is removed three days after the swarm is formed.

I find that, by making a small notch on one edge of the lath, and taking a plug of newspaper to stop it up, the bees liberate themselves in about the right time (usually  $3\frac{1}{2}$  days) by gnawing away the paper.

Porous newspaper should be used, and *not* glazed wrapping-paper, as it takes too long for the bees to gnaw through the latter. By using the paper, increase can be made at outyards, the bees left to free themselves, thus saving one trip.

Georgiana, Fla.

L. E. BALDWIN.

MAKING INCREASE LATE IN THE SUMMER; ANTS IN  
COMB HONEY.

Would it be practicable to make increase now at the end of the white-clover season? I would have made it before, but wanted a full crop of honey. Could I feed sugar syrup and build up for fall crop to advantage? Can you suggest a method of keeping ants, etc., from honey in sections? I have honey which should be taken from

the bees, and I wish to keep it awhile. I have shipping-cases, but, of course, these are not ant-proof. F. B. LAMBERT.

Barbersville, W. Va.

[It would be perfectly practicable to make increase by dividing right after the honey-flow; but all nuclei should be given continuous stimulative feeding up till September, or later if the requisite strength is not obtained. Of course, if one has any kind of late summer or fall flow, no feeding during the time will be required. It should be understood that no brood will be reared unless there is a supply of food coming in constantly. To make this increase properly, one should carefully follow some of the well-known methods. The Alexander plan, as given in GLEANINGS, p. 423, 1906, and again in the last edition of the A B C and X Y Z of Bee Culture, p. 279, will be found as good as any. If the shipping-cases can not be made ant-tight, keep the honey in a room that *can* be made tight.—ED.]

AUTOMATIC UNITING; A GOOD SCHEME.

In place of using wire screen, as has sometimes been recommended when following the Alexander plan of building up weak colonies, I simply place a sheet of paper over the queen-excluder and leave three or four perforations uncovered at the front of the hive by tearing a piece out of the edge of the paper. The uniting in this way is done at one manipulation, as we mentioned in *Canadian Bee Journal* for March, 1908; and if I were asked when I remove the paper I would say that the bees will attend to that; for when we have occasion to open these hives again we find the paper is not there. WM. BEUGLAS.

Plattsville, Ont.

[The plan here proposed seems feasible—at least we see no reason why it can not work.—ED.]

HONEY SOURING IN COMBS WHILE IN THE HIVE.

I am troubled by honey souring in the combs in the hives, and can find nothing in the A B C regarding it. The honey gathered is very watery alfalfa honey, and in about a tenth of the hives it begins souring before it is sealed, and sometimes after it is sealed. The souring commences by small air-bubbles forming in the cells; the bees quit work, and the souring spreads all over the hive, even into the brood-chamber. It occurred to me that there might be some acid antidote for it. HENRY PERKINS.

Calexico, Cal., July 31.

[Will some one who knows please answer? There must be something that the bees gather that causes the trouble.—ED.]

COMB HONEY HAULED IN LUMBER WAGON.

Can comb honey be hauled safely on a lumber wagon without springs, provided six or eight cases of honey (about 200 lbs.) are put in each carrier—of course with hay or excelsior under the bottom cases? JOHN H. JOHNSON.

Bangor, Pa.

[We should suppose that the roads would have a great bearing on this question, and also the distance the honey is hauled. We should be glad to hear from any who have had experience.—ED.]

## SAGE YIELDS HONEY IN IDAHO.

In answer to Mr. Fr. Holmes, Aug. 1, p. 952, as to whether sage yields honey in Idaho and Utah, I will say my neighbor, Mr. Garneld, experimented with one colony of bees by taking it eight or nine miles away from alfalfa or any other cultivated fields, and setting it among the white sage. He went out to look after it every week, and took fresh water. We do not know the exact amount of honey the bees gathered, but they did fully as well as those left at home near the alfalfa. The honey was of that water-white color peculiar to the California sage honey. Mr. Garfield sent samples to California, and it was pronounced A 1 white sage; so we are convinced that the white sage of South Idaho does yield just as much and just as good honey as that of any other State.

Caldwell, Idaho.

J. E. MILLER.

## WHAT TO DO WITH GRANULATED COMB HONEY.

I have granulated comb honey which I wish to feed to the bees for winter. Could I let the bees rob it? or if I took the trouble to melt it over the fire would it again granulate in the hive next winter?

M. P. LEGGETT.

Malvern, Pa.

[We would advise melting the granulated comb honey, thus liquefying the honey and separating it from the wax. If you keep it at a warm temperature for several hours it will not be so likely to granulate during the winter, although some kinds of honey granulate so quickly that it is next to impossible to keep it, even in the hives. Ordinarily, in such a case, we should think it would be better to feed back syrup in the fall rather than to risk using such honey. Your results would then be entirely satisfactory so far as the winter food is concerned, and you would not run the risk that you would if you used this honey which you mention.—ED.]

## HOW TO INTRODUCE A QUEEN IN A LAYING-WORKER COLONY.

I notice on page 948 of the Aug. 1st issue that Mr. Edward Lester thinks it strange that his queen was not killed when introduced on two frames of bees taken from another colony. Now, we have introduced many queens into laying-worker colonies by simply taking a comb of brood with adhering bees and the queen from a normal colony, and exchanging it for the comb in the laying-worker colony that contained the most brood, always leaving all the bees on each comb. By so doing I think we usually get the laying workers, or part of them, on the comb we take out. Any way, this plan works eight out of ten times, and, of course, it is easy to put a queen into the dequeened colony.

Longmont, Col.

G. C. MATTHEWS.

## WHO CAN BEAT IT?

*Friend Root:*—You remember my writing you a year ago last winter about ten swarms of bees I was wintering, that I took from trees that fall as late as November—the last one the day before Thanksgiving. Well, last season was a total failure, and I fed over a ton of sugar to carry my

bees through the winter. Of this bunch of ten I pulled all through the winter, but lost two from spring dwindling. I increased the eight to fifteen, and extracted 1500 lbs. of honey from them. One of these was my champion. They gave me a surplus of 425 lbs. of white extracted honey. Who can beat it? My crop this season is 15,000 lbs.

ELIAS FOX.

Hillsboro, Wis.

## FEEDING LOAF SUGAR TO BEES IN CELLAR.

I have fed my bees in the cellar cube sugar in this way: I covered the bees with a board having two holes that would allow the neck of a Mason jar to fit in snug. I fill the jar with the cube sugar, not wetting it. I place my fingers over the mouth of the jar and invert, placing my hand over the hole and withdrawing quickly. The moisture from the bees will make it so they can use it. I have tried it and it works well.

Massillon, O.

E. A. NEWELL.

## SWARMS WITH VIRGINS LEAVE THE PARENT COLONY QUEENLESS.

Replying to *Stray Straws*, page 988, in regard to swarms with virgin queens leaving the parent colony queenless, I can give positive information. Previous to the past season we never had a swarm with a virgin queen go off and leave the parent colony queenless. The bees would always go back, although sometimes not until the next day.

We have the following to report: Our bees were very strong last spring, and commenced to swarm on apple-bloom about May 20 to 25. At our out-yards we shook them as we usually do from May 20 to June 10, to see how strong they were. We took the brood and made ten-frame nuclei (about 50 of them), giving (to each) ten frames of brood and one sealed queen-cell. Only a few young bees were left on this brood to keep it from starving.

The results were, that about a third of these made colonies swarmed, and ran away and left the parent nuclei hopelessly queenless, and they had to be requeened later on. We were surprised. We caught some of them at it, and missed the bees from others. We had several queenless colonies in the spring. We filled them up with ten frames of brood, and gave a sealed queen-cell, and they all swarmed and ran away, as I was at each yard only once a week.

It was the greatest honey year in forty years; but our crop is short of last year by quite a lot—say half a crop, all on account of this swarming fever. Some swarms came out, and, without clustering, went for the hills. We never saw the like before, and hope never to again.

New Milford, Pa.

F. W. DEAN.

I had a colony that swarmed out with a virgin queen, leaving no cells nor any thing whereby the colony might again become "queenright." After leaving the colony a week, to be absolutely sure they were queenless, I gave them a frame of brood, when they started queen-cells and reared another queen. I regard this as a proven fact, that they will, in some cases at least, leave when the parent colony has no means of rearing another queen.

Fulton, Mich.

CHAS. E. SWEET.

# OUR HOMES

By A. I. ROOT

Behold, the bridegroom cometh.—MATT. 25:6.  
The king's business required haste.—1. SAM. 21:8.

The words of the texts above have been on my mind a good deal the past few days, and they have become very precious to me. Before I finish my talk this morning I hope to make them very precious to you.

Something over a year ago I asked the question here in these pages, "What great event is coming next in the way of invention and discovery?" and a good brother from California, as you may remember, informed us that the next great event that would stir our nation from coast to coast, and, in fact, *all* nations of the earth, would be the coming of the Lord Jesus Christ; and since then I think I have told you that he *has* come, yet most of us knew it not. I presume there are none of you who have not been astonished—and I hope happily so—to note the way in which the temperance work has gone forward in the last few months. It would seem, indeed, as if some mighty power had taken hold of the people—the common every-day people—and that a wave of reform were just before us; for not only in the temperance, gambling, and graft, but *every thing* that is low and bad is meeting such a rebuke on all sides as was never seen before. Let me repeat what appeared in GLEANINGS for March 1, page 298.

A religion that leaves the saloon undisturbed, unattacked, is not worthy to be called after the name of Jesus Christ. Again have we reached a time in the march of Christ down the centuries when, if these should hold their peace, the very stones will immediately cry out. This ethical wave against the saloon has come like a hurricane upon the deck of a pirate ship. There is but one explanation—Jesus Christ is walking across the American continent. Every place where his holy foot is lifted leaves a dry spot; and the meaning is, *the liquor-traffic must and shall be destroyed*. Christ is the source. The saloon must die.—*Clinton N. Howard, before Rochester, N. Y., ministers' meeting, January, 1908.*

Now let me quote from a letter that I received some little time ago:

*Mr. Root:*—On Wednesday, August 19, we are to have a great Anti-saloon League rally at the Lancaster Assembly grounds. Governor J. Frank Hanly, Hon. Seaborn Wright, Bishop Wilson, Governor Harris, and others will be present.

It has seemed best to the Headquarters Committee to call a meeting of the Board of Trustees at that time. While the annual reports and regular annual business of the League will not come up for consideration, vastly more important business will be before us.

The coming county-option elections will present to the League the greatest amount of work and opportunity for victory which we have ever faced. The bitter attack upon Governor Harris by the brewers and the Personal Liberty League, because he recommended the county-option bill, will need to be considered, and the policy of the League in the campaign definitely outlined.

On the 17th and 18th we are going to have a workers' conference on methods for county-option work. If you can come a day or so earlier and join this conference I am sure it will help us, and you will doubtless get some inspiration for the county-option work this fall.

W. B. WHEELER, Supt.

Columbus, Ohio, July 11.

Perhaps I should explain to you that Wayne B. Wheeler is superintendent and attorney of the Anti-saloon League of Ohio, and he is, perhaps, one of the most able men that we have at the present day. I felt it to be a great honor to get such an invitation from friend Wheeler; but I mentally thanked God as I read it that I was also honored by being asked to be present at a meeting where the governors of three States were ex-

pected to stand up and indorse the Anti-saloon League of America.

Before making any report of the doings at the Lancaster Chautauqua, let me give you a little explanation. This is a Methodist assembly ground, and I think there have been gatherings for some twenty-five years in the same place. It is located on a beautiful hill along the Scioto River, in Fairfield Co., not far from Columbus. There are between four and five hundred pretty little cottages there. These make a miniature town, but it is not laid off into regular streets. The fanciful little cottages are all different from each other—located on paths that run around through the woods—in fact, we might almost call them cow-paths. The Methodist people come there every summer and stay three or four weeks. They bring their carpets, rugs, easy-chairs, and a sufficient equipment for light house-keeping. Every house has a pretty little porch in front, and the people live mostly outdoors in God's open air. On the top of a hill, right in the center of the village, is a beautiful auditorium large enough to seat five thousand people comfortably. Great speakers are secured—many of them, perhaps, as good as the world can furnish, and this large auditorium is generally filled. As electric cars run every half-hour from both Columbus and Lancaster, it is an easy matter for the people to reach this great educational gathering. Besides the main auditorium there are two smaller ones for committee meetings or any thing else that may be needed at a time when the large room is occupied. Just before the work of our conference, the "Temple," as this auditorium is called, was occupied by a gathering of school-teachers. There is always something going on day time and evening on this assembly ground. There are a great many nice people there—men, women, and children; and during my stay there of two days looking around among the people right and left, I not only never caught sight of a cigar, cigarette, pipe, nor any thing in the shape of tobacco, but did not hear any thing approaching an oath, nor even an unkind or uncivil word.

If there were differences or misunderstandings at any of the meetings or anywhere else, the people had grace enough and Christianity enough to keep them out of sight. In fact, my stay at that Methodist Chautauqua induced me to go home and hunt up the following passage from the book of Revelation:

And there shall in no wise enter into it any thing that defileth, neither whatsoever worketh abomination, or maketh a lie.

Before I go further I want to say a word about open-air meetings. This great auditorium has broad shutters or doors so arranged that they can be put down in stormy weather, but ordinarily they are raised, so that the meetings are practically in the open air. You know there is much said just now about *sleeping* in the open air. Well, I think we need to apply the same kind of reasoning to our meetings—especially our religious assemblies. It used to be almost proverbial that the tired farmer and sometimes even the old deacons would go to sleep regularly (?) in meeting. Mrs. Root has often asked the question why she should be unable to sleep nights, when she *ought* to sleep, and yet have a desire to sleep promptly the next day right in the midst of an interesting sermon. But it just begins to dawn on me that

the poor woman (God bless her) and the tired old farmer and the aged deacon went to sleep just because of a *lack of ventilation*. Opening the windows just a little is not enough to accommodate a great lot of people. If, like Terry, we could take the windows out entirely, during church time, in summer, that would be better; but it does not *begin* to compare with having all the walls of the building so that they can be thrown out so as to make a porch, keeping out the sun in hot weather, and letting the air circulate freely. I repeatedly looked over that audience of five thousand people at that gathering, without finding any one who even *looked* sleepy. The great speakers may have had *something* to do with it; but I think God's free open air had still more to do with it.

There were something like 150 to 200 representatives of the Anti-saloon League from the different counties of this State. They were mostly ministers of the gospel—*God-fearing* ministers who did not hesitate to stand up bravely and squarely for the abolishment of the saloon.\*

While we were holding a committee meeting—in fact, while somebody was speaking—a bright little woman came in from the outside. She came in so quietly, walking on the sawdust floor, that nobody, not even the chairman or the speaker, seemed to notice her. She walked up with a pleasant smile on her face, and this smile was rendered more attractive, it may be, because of the slightly heightened color on her face. I began wondering what she wanted, and looked toward the chairman as he rose. Finally she said in a quiet voice, "May I be excused for having the 'cheek' to presume to interrupt your meeting for just a moment in this unusual way?"

Of course, the speaker stopped and the chairman smilingly gave her permission to speak.

"Well, friends, Governor Harris is coming, as you know, this afternoon, and we want each one in the Boys' Brigade to carry a little flag. We have no flags, and we must get the order off on the next car if we get them here in time. We want a little money, and the women told me if I would have the courage to come down and interrupt your meeting I could get it without question."

"How much money would you like?"

"I think two dollars would do."

In a twinkling a hat was passed around, and the money was poured out on a bench; and while she was counting it the speaker resumed. She rose to thank us, and as she did so I noticed a sort of roguish smile on her face, especially when she informed us that she had something over *six dollars*. I began thinking that she did not need that amount to get a few little flags for the Boys' Brigade, and thought that perhaps the proper thing to do would be to give back a part of it; but as soon as the criticism came into my mind something (was it not the Holy Spirit?) suggested the incident about Judas complaining because

the woman wasted a box of precious ointment. Dear friends, I have all my life been somewhat backward about encouraging display, or, if you choose, in using so much money for political or other campaigns. Perhaps I have been making a mistake. It surely is right and proper that we should go to considerable pains to give reverence and welcome to the chosen Governor of our State of Ohio. We should honor his position, even if it should happen to be true that we could not also honor the man. But may the Lord be praised that at *this* time we have a Governor who is a rugged, honest old farmer, a veteran soldier of war time, and, more than that, a Christian man who dares to come out in the open and indorse and back up the Anti-saloon League of Ohio. I will not repeat here the speech he gave us, for most of you have probably seen it in the papers. But I happened to be near when the Governor got off the train; and not only did each one in the Boys' Brigade have a little flag, but a like number of little girls dressed in white also had flags, and back of them were some larger girls with flags. By the way, it may not be out of place here to say that I not only love little boys of the State of Ohio, but I love the little *girls* too, and I do not know but I might almost say, as somebody else has said, that, the bigger they get, the more we love them. Yes, I am going further than he did. After the little girls with the flags, and the bigger ones, came the grown-up mothers, also dressed in white, and each one had a little flag, and then came the old grandmothers, perhaps a hundred of them, and *they* had flags; and they were not only dressed in white, but they had *white hair*, and I felt glad and happy to find that, away down in my heart, I loved and *admired* the white-haired old ladies more than I did any of the rest. May God bless the mothers and grandmothers of our land.

Now, friends, that bright little woman with that pleasant smile on her face (enhanced by the slight color because of the nature of her undertaking) was right. She was doing God's work. She was right in line with the second one of our texts where it says "the king's business required haste." We were all glad to see her come, and we were perfectly willing to be interrupted. I think I omitted to state that she announced at first she was a W. C. T. U. woman, and *such* a woman can never interrupt or hinder the *Anti-saloon League*. They have been our greatest aid and our greatest help. In fact, the Anti-saloon League would perhaps never have existed had not the W. C. T. U. "started the ball rolling."

Let me tell you something else that rejoiced my heart. When the so-called Personal Liberty League holds its meetings the members of it desire secrecy, for all liquor people keep closed doors. They do not want any spies to get in. But it is not so with temperance workers. We can say as Jesus did, "In secret have I done nothing." Our deliberations are all wide open. The W. C. T. U. women or anybody else on the face of the earth can come right in. We should be glad to have even the *saloon-keepers* with us to listen to our reasoning. Some speaker at one of the committee meetings said something like this: "If you turn a strong searchlight down into a rat-hole, that hole is *spoiled* for rat purposes." The rats can not bear the strong light.

\* When Senator Rose, the author of the county local-option bill, was introduced to that great audience, the applause was almost deafening. They could not make any noise by stamping with their feet on the sawdust floor, and so they clapped their hands, and shouted until they were tired. Then somebody started the waving of handkerchiefs and the outstretched hands of fully 5000 people made a flutter such as I for one never saw before. Senator Rose is not only a great reformer, but he is a great orator.

"Men love darkness rather than light because their deeds are evil" *Our* deeds are not evil. They are right, in the sight of God; and the more light there is thrown on them the better it suits us. The enemy has just been saying that the Anti-saloon League people dare not tell how much money they have received nor what they did with it. That is a vile falsehood. Our receipts and expenditures have been fully given, in print, in black and white, ever since the League was started. It may be true that the names of the donors have not always been given to people who have no right to them, for the saloon sympathizers might boycott these donors or do them harm, and every one has a right to have his name kept out of print if he so desires.

Bishop Luther B. Wilson, President of the American Anti-saloon League, is a great orator. His subject was "The American Flag, and the American Saloon." He put in a tremendous protest against having the American flag float over our saloons and breweries exactly as it does over our schoolhouses. The first time I visited the city of Indianapolis I inquired what massive brick building it was that overtopped every thing else in the city. I was told it was a *brewery*; and floating over this brewery was perhaps the finest and largest American flag I ever saw. If I remember correctly, the flagstaff was held up by a huge statue of Gambrinus. I hope and pray that Governor Frank Hanly will have that flag hauled down before he ceases to be Governor of Indiana. May be he has had it pulled down already. Bishop Wilson said he was one day waiting for a street-car in one of the large cities of the East. A man whose business it was to take care of a little station was sweeping up around his post. The bishop noticed that the man had an American flag tacked up on his little booth. Then he began asking some questions something as follows:

"My friend, why do you love this American flag more than you do that of your own nation where you came from?"

The man replied something like this:

"I love the American flag more than any other flag in the world because it means a square deal to every citizen, no matter whether he is rich or poor, white or black, educated or uneducated. My girl here in America goes to school. She has just the same chance and the same care as the girls of the millionaires. She goes to the library and gets books, and the librarian takes just as much pains to find what she wants as if she were rich or educated, or held some high position. If they do not have the book she wants, the librarian tries just as hard to get it for her as he would for any one else. That is why I love America, and why I love the flag that has stars and stripes on it. It means a square deal to all this country's people."

I will take space to relate two incidents in the bishop's talk. He remarked that, in the natural order of things, crime is of gradual growth. The criminal usually goes along step by step; but by the aid of whisky and the American saloon, criminals are sometimes made in an hour. An incident that most of you doubtless read in the papers some two years ago was related, with some sidelights that the papers did not contain. A young man of good family and pretty good hab-

its married a nice young girl, I think in New Jersey. It is true he had been with some questionable companions; but his friends hoped that, after his marriage he would turn over a new leaf—and he did, at least for a time. He had been sowing some wild oats, but not very many. Not long after his marriage some visitors came to see them, and the young wife asked him to go down town and get some needed things for dinner. Before he made his purchases, however, a couple of his old boon companions said to him, "John, we were just wanting you. Come in and have a drink."

John replied, "You will have to excuse me today, boys. Some company has come, and I must hurry back with the things my wife wants for dinner."

Please note he did not tell his old friends that, since his marriage, he had not used any drink, or, better still, that he had joined the Anti-saloon League, and was on a different track. He only asked them to excuse him that day. I wonder if some boy or man will not make a mark right here and learn a lesson from this. But these old chums were not to be so easily put off. One of them said, "Well, John, you will certainly come and have a cigar? You can smoke that while buying your stuff;" and as there was no good reason (as it looked to him) why he should not have a cigar he went along with them. We shall have to draw the curtain now for the time being, for the saloon has screens over its doors and windows. It would be like the searchlight and its effect on rat-holes if people could see inside. Let me digress enough to tell you there was a very pretty girl in that neighborhood who had a widowed mother. John, before his marriage, had been on rather intimate terms with this girl—at least she was well acquainted with him and trusted him. These two fellows who invited John to drink had got an eye on her. They knew she would not speak to them nor have any thing to do with them; but if they could make a catspaw of John they thought they could get hold of the girl. The next morning the whole city of Paterson was startled by the information that this beautiful young girl was found on the banks of a river, among the stones and bushes, *dead*. She had no father nor big brothers to protect her, and these two devils in human form had planned to get John drunk, and then persuade him to get that girl into their hands. The long trial that ensued showed that John had been seen to invite the girl to go into some place and have a glass of lemonade that afternoon. Of course, it made a stir in the papers, and we all felt glad when those three men were sent to the penitentiary for a long term. Not very long ago, however, my blood was made to boil by seeing a notice in the papers to the effect that a petition was being circulated to get those fellows out of the penitentiary. The excuse was that they did not *intend* to kill the girl. It was only an unfortunate accident. Now, that may be true—that they did not *deliberately* plan to take the girl's life. That could have been no object. But I want to ask you all, *in Heaven's name*, how much *better* was it than *death* that they did plan to do? Now, friends, it is not at all unlikely that the stars and stripes are just now floating over the saloon that furnished the liquor—yes, the *drugged* liquor—that took the life of that

girl Is it not high time that our flag that floats proudly over our schoolhouses and other places of learning should be hauled down and kept down when seen floating over dens of infamy like the American saloon?

Governor Frank Hanly is one of the greatest speakers, and one of the most fearless speakers, in my opinion, that the world contains; and if there should ever be a chance to vote for him as President of the United States, I would vote for him and work for him as I never worked for any other candidate or anybody else in my life. I hope the papers will give a report of his wonderful talk on that occasion.

I will close with one more incident from Bishop Wilson. It seems he has recently been sent to Porto Rico. When nearly back to New York the officers of the vessel blundered in their reckoning. The bishop did not tell us the crew had been drinking, but I can not understand what else should cause the pilot and officers of a great vessel to lose their reckoning. The bishop heard the breakers, indicating that they were nearing danger, and informed the officers of it. They laughed to think that a landsman should presume to tell them where they were. While he was insisting that he was right, and that they were off the track, the vessel struck the ground. They signaled a life-saving station near by, and got all the machinery they could muster to get the vessel off. By wireless telegraphy they finally got a powerful tug, with a tremendous rope, from the city of New York; but for quite a time all their efforts were unavailing. When a great ship, from stupid management, runs at full speed into a sandbar it is not an easy matter to get it off. After the steam-tug and all the appliances for such work had exhausted every resource without avail, they were quietly told by some one to keep on and not give up yet, for the *tide was rising*. And the tide kept on rising, and soon they got off. Do you see the point, friends? The Anti-saloon League has been working for some fifteen years trying to wake the people up, and trying to get our good and righteous laws enforced—Sunday-closing laws, for instance. But the great vessel of state was too strongly foundered on the sandbanks. The enemy was almost too much for us, and at least *some* of us were almost ready to give up; but for the sake of the mothers and little children we kept on. Meanwhile the tide of public indignation was rising, and we did not know it. When the good brother away off in California told us that the Lord Jesus Christ was coming to shake the earth we did not believe it.\* One of the first indications we had of his "foot-steps" was away down in Georgia; and then other southern friends fell into line and declared that the saloon must go. We who were pulling on the rope did not know any thing about the great agency that was *bound to envelop and engulf and sweep the whole earth*. We were surprised when the news came about the *unexpected* help. Of

course, the enemy is making resistance. The brewers are massing their millions. The riots in Springfield and Chicago, Ill., are waking the people up as they never were awakened before.

The W. C. T. U., the Anti-saloon League, the Prohibition party, and all the other temperance agencies and leagues and organizations, have been working and praying, and perhaps wondering, many of us, why our prayers were not answered. We were like the big cable and the steam-tug, together with the people at the life-saving station, and just when the job seemed too much for us, a new and unexpected agency—a great tidal wave, in fact—started up, unbeknown to us, and the enemies of righteousness were as much astonished as we were to find the work done before we knew it.

The churches of our land are massing together; and there are some indications that the political parties are going in a like manner to mass together. The farmers, and their wives and mothers who have stayed at home and attended to their own business, are waking up and massing together, and a mighty tide that bids fair to sweep the whole world is claimed to this one thing—*the saloon must go*. SATAN IS BEING DRIVEN OUT, AND THE LORD JESUS CHRIST IS COMING IN. "BEHOLD, THE BRIDEGROOM COMETH."

## HIGH-PRESSURE GARDENING

By A. I. ROOT

I notice in GLEANINGS, page 1084, an account of a new variety of wheat, also statement of seven-headed wheat, or Egyptian wheat. In 1856 I was farming on Trinity River, 15 miles from Weaverville, the county-seat of Trinity County. My brother was in Salt Lake City, and sent me by mail a small package of seven-headed wheat which I planted and got several quarts of wheat, which I planted the next year and got at the rate of 80 bushels to the acre. I took some of it to the mill and got it ground to flour. It would make sticky dough like hulled barley, but would not make bread that could be eaten. I could not sell the flour or wheat as people were afraid to feed it to their horses, so I quit raising it. Some of it had the seven heads all right. I wish I had it now for chicken feed. Encourage this 277-bushel humbug, as it may grow 80 bushels per acre for chicken feed, and be profitable for that alone. O. S. LOOMIS.

Fountain, Col., Sept. 4.

Many thanks, friend L.; but please remember that you can get a much larger yield per acre from a little piece of ground than you can where you prepare and sow a whole acre. Perhaps it is not easy to explain why this is so; but our experiment stations will tell you that small plots, as a rule, give a much greater yield than where you sow an acre or several acres, even with the best care that you can give the larger plot. If it is good for chick feed, by all means let us have it. Who can tell us where to get the seed?

### SWEET CLOVER—HOW LATE IN THE FALL CAN THE SEED BE SOWN AND STILL WINTER OVER?

We are desirous of planting sweet clover for bee pasture. Our land is in Mount Lebanon, Columbia Co., N. Y. The land is high and our winters rigorous. We are uncertain as to the best time to plant—this fall or wait until spring. If planted soon would the clover gain growth enough to live through the winter? If so, would it blossom next summer? Your answer would greatly oblige two bee sisters who have had wonderful success in their three years of bee culture. Our knowledge has

\* As an indication of what is going on right here in Ohio, see the following, just received from Wayne B. Wheeler:

Mr. Root:—Tell your people that between forty and fifty counties are already organized to vote the county dry. In some counties, like Meigs, over one hundred public meetings have been held. Scioto Co. has had the campaign on for over six weeks, and has held between one hundred and two hundred meetings. Every thing is red-hot in that county.

Columbus, O., Aug. 21.

W. B. WHEELER, Supt.

been gained from the A B C book and GLEANINGS, which latter always comes to the rescue in every emergency. A healthier and more beautiful apary could not be desired. Thanks to all our bee friends who so generously give their experiments and experience from which we profit. Any suggestion will be most graciously received.

ALICE S. CRANE.

Mt. Lebanon, N. Y., Aug. 15.

My impression is that if the seed is worked well into the ground, and there is plenty of rain, the seed, if sown any time during September, will probably make root enough to stand the winter. The roots of sweet clover go away down into the ground, as most of you will admit who have tried to pull up the plant, and especially on hard dry ground; and it takes an unusual amount of freezing to throw it out. Now, I wish the others who have had experience in this line would tell us about how late the seed can be put in and still winter over. I will sow some seed at different times and report.

MIRACLE WHEAT; THE SATURDAY EVENING POST SENDS A MAN TO INTERVIEW ABRAHAM ADAMS.

We are glad to know that the *Saturday Evening Post* has had enterprise enough to get down to the real facts in the matter. We clip the following from their issue for Sept. 12:

The *Saturday Evening Post* dispatched a thoroughly reliable man to Idaho to examine the wheat on the ground, and his wired report, which follows, pretty thoroughly disposes of this agricultural marvel:

"Assertions of huge crops of good flour-making qualities not justified. Adams' only claim of proportion of two hundred bushels an acre is with an eighth-of-an-acre patch two years ago. For last year, admits farm average only thirty bushels. So far this year only twenty-five to thirty-five an acre. Offers excuses such as weeds and undersowing. Not true that wheat has been successfully grown elsewhere. Misleading to say frost-proof, for admits some injury by snow. Flour-making qualities unknown. Adams was given experiment-station analysis last year, and told with it that milling test was necessary to show the quality with certainty. Has not had the test. The wheat in appearance is much like certain large coarse wheats; not valuable for flour."

The *Indiana Farmer* suggests that this person should be punished under the United States postal laws for using the mails for fraudulent purposes. We heartily second the suggestion. The Department of Agriculture sent a special agent to Idaho, and here is his report:

Alaska yielding twenty-five bushels an acre. Badly mixed. Grain inferior. Quality soft and white. Ordinary wheat yielding fully as much. Best varieties, more.

THOMAS W. LAWSON.

When this man first came out with his *expose* I commenced to read carefully every word of his writings. I continued until I was satisfied the man was but little if any better than the other men he claimed to be exposing; and just recently I have been reading his paid-for advertising in the daily papers. Now, I hope it is not true that money has been pouring into his coffers at the rate he tells us it has. Farmers, gardeners, and fruit-growers generally are prospering; and I am glad to know that some of them have a little money ahead, and perhaps most of them have. But God forbid that their hard earnings should ever go to support and encourage men of the Thomas W. Lawson type. Just now I am rejoicing to see such a grand home paper as the *Ohio Farmer* come out boldly as they do in the following:

This man is again spending thousands of dollars, advertising in papers all over the land. Now he booms or bulls a certain stock or line of stocks, advises all his "customers" to send him their checks and orders for "margin investment," and the mails

and telegraph offices (he declares) are choked with buying orders. Of course, the stock rises for a time, and he reaps his percentages. Or, now, he "bears" the market—advertises that certain stocks are sure to fall, and selling orders crowd the mails and the stocks fall and he gets his percentages on all the sales. Let him and similar men alone. Speculating on margins of grain or railway or other stocks is one of the most dangerous, delusive, and harmful kinds of gambling, and the "lamb" usually "get shorn." Gambling is exactly what it is. Let us call a spade a spade. It is the business of the farmer to grow wheat, corn, and oats—not to gamble on them, and he is foolish, not to say morally wrong, wherever he "bets on the other fellow's game."

## HEALTH NOTES

### SHREDDED-WHEAT BISCUIT.

Mr. A. I. Root:—I have been reading what you say about the use of shredded-wheat biscuit. I had a severe fit of sickness last spring, which lasted about six weeks. Since then I have used largely of the biscuit as an article of diet. My practice is to soften the biscuit well with hot water, then flatten it and cover with butter, then pour on a liberal quantity of best extracted granulated honey, and eat with a spoon. I have made a larger use of eggs than ever before, but use no meat. I am now 77, and have taken care of 100 colonies of bees this season. I have used no tea nor coffee for years.

EDWARD BEVINS.

Leon, Ia., Sept. 6.

Here is a newspaper clipping sent me by a friend. I do not know what paper it came from.

### SECRET OF LONGEVITY.

Wu Ting-fang, the famous Chinese diplomat, recently said he had discovered the secret of long life, and averred that by his system of diet he could live 200 years—a term greatly exceeding the longest possible period as fixed by Prof. Metchnikoff, of the Paris Pasteur Institute. Naturally the Chinese minister's statement excited much curiosity, and a Boston man wrote to him for particulars, receiving the following plan as adopted and put in practice:

"In answer to your letter requesting my plan of diet I have to say: 1. I have given up my breakfast, taking two meals a day, lunch and dinner. 2. Abstain from all flesh food. My diet is rice, or when I go out to dinner, whole-wheat bread, fresh vegetables, nuts, and fruit. 3. I avoid all coffee, co. tea, liquors, condiments, and all rich foods. 4. I have given up salt also, because it is found that salt makes the bones stiff. 5. I masticate every mouthful thoroughly before it is swallowed. 6. I do not drink at meals, but between meals or one hour after meals. 7. I practice deep breathing. 8. I take moderate exercise."

Minister Wu Ting-fang's fifth rule aligns him with the followers of Fletcherism, though in other particulars he is a law to himself. Mr. Fletcher eats only when he is hungry, and does not eat meat, though not making this a rule for others.

The plan of the Chinese minister will commend itself to many practical experimenters in dietetics. It is sensible, and combines exercise and deep breathing with frugality—a wholesome scheme of living.

You will notice from the above that Wu Ting-fang agrees exactly with T. B. Terry in No. 1 in recommending two meals a day, and I think he agrees with Terry also in No. 2 in abstaining from all flesh foods. In No. 3 he agrees with Terry and A. I. Root also. No. 4 I do not know about. When I am eating green corn I want butter and salt both, and quite a little salt, and I want milk to drink with it. It may be that one can get along without salt, and that salt does make the bones stiff. I shall have to say I do not know, for I never tried living without salt. No. 5, in regard to thorough mastication, we all agree on. No. 6 also. I drink only milk, and only about half a teacupful at that. If I drink more than that three times a day, nature, sooner or later, makes a protest. With Nos. 7 and 8 we are all entirely at an agreement. The concluding suggestion, about eating only when you are hungry, might do for some people, but I, for one, want to sit down with a lot of other people and have somebody give thanks, and then talk and laugh and feel happy while I chew my food, and try to make everybody else feel happy.

In regard to abstaining from flesh food, after I tried entire lean meat, as I told you, and after having been at another time of my life *four years* a vegetarian, except that I had eggs and milk, I shall have to say I am undecided. In warm weather, when I can have what I want, as I do at home, I think I would give up meat (I am sure I feel better without it, and it might help to break up the "meat trust"); but while I am traveling, especially during very warm weather, or at other times, when I get what is commonly called "summer complaint," I must reserve the privilege of a pure lean-meat diet until I begin to straighten out. *I do not know of any other way.* Last, but not least, especially when I feel out of sorts, I would go to almost any expense or trouble to get *pure soft water*. Rain water that has been boiled has so far always proved to be all right on that score for me.

## POULTRY DEPARTMENT

### THE SECRET OF RAISING CHICKENS IN AUGUST.

I want to say something about my discovery—at least I never heard or read of it in any of the poultry-journals. I think it might be worth \$5.00 to many of you. But I am not going to charge \$1.00 for it, nor even 50 cents. Here it is, free to all. Get a sitting hen if you can in August, and let her raise a brood of chicks while she is moulting. Moulting hens rarely lay any eggs, so there will be no time lost, and you actually kill two birds with one stone by letting her run with the chickens while she is on a moult. Mrs. Root insisted that it was too *late* to raise chickens. But I set one hen with 17 eggs about the first of August. She hatched 14 chickens, and has 14 now, this 11th day of September. I never saw chickens grow faster or seem happier, and they will certainly be well feathered out when cold weather comes. The hen commenced dropping her feathers when the chicks were about a week old, and now she is fairly feathered out. By the time the chickens are ready to winter, she will be in good condition to lay again. And, by the way, I have got a nestful of small pullets' eggs, laid by the Brown Leghorn "day-old chicks" the 14th day of April. You see they commenced laying before they were five months old, and so they are already paying for their food. Is not this getting your money back in pretty good time? While the old hens are in moult, the pullets are supplying us with eggs.

### THE DAY-OLD CHICKS, AND HOW THEY TURNED OUT.

On page 586, May 1, I mentioned the fact that I took home 25 chicks in a little box. They were hatched April 14. There were 15 Brown Leghorns, 4 Buff Orpingtons, and 6 White Plymouth Rocks. As I had no brooder, and the weather was too cold to put them outdoors, I put them up by the steam-pipes in the greenhouse. Well, the Brown Leghorns *all* lived; but I lost 2 of the Buff Orpingtons and 5 of the White Rocks. It rather looked from this that the Brown Leghorns

were a hardier breed, and I feel satisfied from this experiment (and some others seem to think so too) that I need not have lost any of them, had I kept them away from the artificial heat. The Brown Leghorns, when 4½ months old, commenced laying. As every one of them seems to be a true type of the Brown Leghorns, I think Mr. Uhl furnishes very choice stock. The two remaining Buff Orpingtons are both pullets. They are large and beautiful fowls, without a wrong feather—that is, so far as I can discover, and I think they will lay soon. The single White Rock was a male; and when 70 days old—that is, exactly 10 weeks—he weighed an even 3 lbs., and at the age of 4 months he weighed 6¼ lbs. One reason why I weighed him was that friend Philo, in his advertisement in GLEANINGS, said his Orpingtons, bred in confinement, weighed 2 lbs. when 8 weeks old. There has been some criticism in regard to what was called his extravagant advertising; but in view of what I have just said, I do not think it at all extravagant. Chickens when properly hatched, and have plenty of food, without being scrimped a day of their lives, will give no trouble in making such a record as the Orpingtons and Rocks, and may weigh fully as much as he claims. You see, in buying baby chicks you escape all the trouble incident to an incubator, and get *choice stock* for a small sum of money.

The Brown Leghorn chicks cost 8 cts. each, and the Buff Orpingtons and White Plymouth Rocks, 10 cts. each. I sold the big white cockerel, when 4½ months old, for \$1.00,\* and one of the Orpingtons for \$1.50. From some experiments I made in Florida, where grain is much higher than it is here, I decided that a nickel would pay for the feed of a chicken until it is ten weeks old; and 10 cents more would pay for the feed until it is four months old. Now, if this is true, what better business do you want than raising chickens—that is, if you have no more losses than I have had, and start with some choice breeds?

THE "CHICKEN BIBLE;" SEE PAGE 1025; ALSO SOMETHING IN REGARD TO GOOD BOOKS FOR FARMERS, NOT ESPECIALLY DEVOTED TO POULTRY.

Mr. Root:—In your Aug. 15th issue you pass on Mr. Cogswell's inquiry for a "chicken bible." There is no chicken book exactly like the A B C of Bee Culture, but possibly the two most practical poultry writers of modern date are Robinson, of Boston, and Brown, of England. "Poultry Craft," by J. H. Robinson, editor of *Farm Poultry*, of Boston, is certainly the safest, most up-to-date, and most complete outline of the chicken business to be had, using "complete" in the sense of general all-around outline, the book not being large, having only 272 pages. For a more exhaustive treatment of the subject, Robinson's first and second series of Lessons in Poultry-keeping are probably unsurpassed, and his Common Sense Poultry Doctor, published in 1907, is the best book for general use on that subject. Any person much interested in chickens should have Robinson's books and his monthly paper, *Farm Poultry*, as well as the *Reliable Poultry Journal* and the Cypher's series of poultry-books which you list.

While writing on this subject I should like to call your attention to Fred Grundy's (Morrisonville, Ill.) so-called "Perfected System." It is true it is one of these pamphlet poultry systems, but is one of the most practical I have seen; and his "fireless brooder" is much better, in my opinion, than Philo's, whose book I also have (as well as numerous other poultry publications). For a beginner, Grundy's pamphlet is excellent, except his water-tank, which can not be cleaned properly, the two-part tank being better.

There is another book, or pamphlet, of 56 pages, to which I

\* After I told the man he might have him for a dollar, we found he weighed 7½ lbs. With the free range he had all his life, I don't think his feed cost more than 15 cts., and large spring chickens are quoted in the market at 15 cents per lb.

have long intended to call your attention. I have never seen it advertised in any paper, and found it only through an incidental allusion in a *Farm Poultry* editorial. It is F. O. Wellcome's "The Trap Nest Book," Yarmouth, Maine. Presumably the author does not care to sell his pamphlet except with his nest patent, but he will sell it separate on request, and I advise every poultryman interested in breeding for eggs to get a copy of the very excellent little book, whether he uses any trap nests or not.

While recommending chicken-books I should like to mention two others of general nature. The first is the equivalent of your A B C book. It is the "Farmers' Cyclopaedia of Agriculture," by the United States Department of Agriculture officials, Wilcox and Smith (Orange Judd Co.). Prof. Bailey has a large cyclopaedia, excellent for libraries, but too expensive for most farmers. But the Wilcox and Smith book, 619 pages, ought to be in every farmer's home, being so up to date and sufficiently complete.

The second general book or books I wish to recommend are the three "Practical Farm Experience" books written by farmers, summarized by Prof. W. F. Massey, and published by the *Practical Farmer*, of Philadelphia, one of your advertisers. Any farmer who has not these books is missing a treat, and will be glad, after reading them, to have had his attention called to them. And I must also highly commend Prof. Holden's A B C of Corn Culture (Simmons Pub. Co., Springfield, Ohio), which you recommended a while back. For its price, 10 cents, it is about indispensable to every corn-grower. It ought to be in the library of every farmer and of every district school.

I have no connection with nor personal interest in any of the books mentioned in the foregoing. I merely like to pass a good thing along. GENESIS FARM.

Greencastle, Ind., Aug. 26, 1908.

I am sure we are very much obliged indeed for the above from one who has no interest in any of the books or periodicals mentioned. Friend Grundy's little book, "Perfected System," is certainly a valuable little work, and I would have given it a good editorial notice before this time

were it not such a very small book for the price. I believe it was originally sold at \$1.00, but the price has been reduced to 50 cents. Perhaps we ought to be satisfied with this latter price, but it still seems to me that a fifty-cent book, especially of such small size, should have better print, better paper, and better engravings. I know there are a good many people who do not agree with me in regard to this matter, and may be I am wrong about it. The trap-nest book, if I remember correctly, is also 50 cents, and I would find the same fault with it that I do with the Grundy book, and something else besides, because the book from beginning to end is an advertisement of his patent-right trap-nest. At the same time, the trap-nest is a good thing—the best one I have ever gotten hold of; and the trap-nest book tells us more about egg-laying, and how to tell absolutely which hens lay eggs, than any other book or lots of books I have ever gotten hold of; and I can heartily indorse all that is said about the A B C of Corn Culture. This book is as large as some of the fifty-cent books, and the price, 10 cts., is ridiculously low. If every corn-grower would get a copy and read it, it would put hundreds of dollars' profit in the pockets of thousands of people. By the way, we are cutting our ten acres of corn to-day, Sept. 14; and I believe the general verdict is that it is one of the nicest pieces of corn in this part of Ohio.

## Don't Buy a Stove or Range Until You First See How Much You Save By Getting

### "A Kalamazoo Direct to You"

TRADE MARK REGISTERED

**YOU** want to make every cent you spend this year, **count for quality and economy.**

If you need a stove or range, don't buy until you get our **factory prices.** I promise you that I will save you \$5, \$6 or \$10 on our smallest stoves, and as high as \$18, \$20 and even \$30 on our largest. And I promise you that you cannot get **anywhere at any price**, a better stove or range than the Kalamazoo.

Just let me quote you prices. Take our catalogue and **compare the Kalamazoo quality and prices**, with the best line of stoves and ranges you can find sold at retail. **That** will tell the story. You can see for yourself. You want to save money and you want to get high quality. Why not investigate our plan, then? Why not let me show you the difference between manufacturers' prices and retail prices on stoves or ranges?

We sell to you, direct from the factory, at actual factory prices,

## On 360 Days Approval Test—We Pay the Freight

I promise, in black and white, to refund your money—every cent of it—if you do not find your purchase in every way exactly as represented.

Remember, every Kalamazoo is of the highest possible grade, made of the best materials and in the best manner. You deal directly with the manufacturers—a company that has a larger number of individual customers than any other stove company in existence. We have sold thousands of stoves and ranges to readers of this journal, and no doubt can refer you to near neighbors who have saved money by buying a Kalamazoo. Many customers write that they have saved enough on a single Kalamazoo to pay for a whole season's fuel. You can save enough to buy a new suit, a new dress, an article of furniture, or perhaps to pay your taxes. Is it not to your interest to get our prices!

## Send Postal for Catalogue No. 416

describing more than 300 sizes and styles of Coal and Wood Ranges, Coal and Wood Heaters, Hotel Ranges, Base Burners, Laundry Stoves, Etc.

I know that if you get our prices—and see our quality you will not even think of buying any other make. Let me show you how much you can save.

**William Thompson, Vice-Pres. & Gen. Mgr.  
KALAMAZOO STOVE CO., Mfrs. Kalamazoo, Mich.**

All Kalamazoo cook stoves and ranges have patent thermometers which make baking and roasting easy.

## Read His Letter

Read of the economy and profit in this farmer's potato-digging,—how he gets every potato in the field,—how he avoids loss from scarred and crushed potatoes,—how he has made the work easy and fast.

## It Tells You how the Acme Hand Digger ATTACHMENT

proved out under hard, practical actual field use:

Potato Implement Co., Traverse City, Mich. Gentlemen:—Two years ago I bought one of your Acme Hand Potato Diggers and after giving it a short trial in the field, my sons, who were digging the potatoes, were so pleased with the Acme Digger that I now have five in use on my farm.

The Acme is just the digger we needed. Unlike the machine diggers it digs clean, gets every potato in every hill, doesn't scar the stock, and is not bothered by the vines. The men work easily, yet quickly, and don't get so tired as with ordinary fork or hook digging.

I know from my own experience that the Acme Digger does better, easier and cheaper work than any other digger I have seen, and the best recommendation I can give anyone is that I continue to use it on my own farm.

I am, yours truly,  
F. LAUTNER, Leelanau County.

**Send \$1.00 Today.** Let the Acme Attachment prove itself to you. Let it prove that your dollar is better than \$100 investment in other diggers—that it will dig potatoes better and more economically—that it is the digger you have been waiting for. *Send prepaid by express.* Money returned if you had rather have it than keep the digger. Pamphlet and Potato Book free on request. Send now. Address Box 520,  
**Potato Implement Co., Traverse City, Mich.**

## BARNES' Hand and Foot Power MACHINERY

This cut represents our combined circular saw, which is made for bee-keepers' use in the construction of their hives, sections, etc.

## Fashion Book Free!

I want to send you my handsome new book showing over 400 of the latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for 5 cents each. They are the same patterns you have always paid 10c and 15c for at the stores, made by the same people, and correct in every detail.

### HOW I DO IT.

I publish **The Home Instructor**, an illustrated woman's magazine and I want your name on my subscription list. **The Home Instructor** is bright, entertaining, clean and instructive—just the sort of a paper you should have in your home. It has departments for every feature of home life, and prints the choicest fiction every month. Every issue has several pages devoted to the latest fashions, fully illustrated.

### My Special Offer.

Send me 25 cents and I will send you **The Home Instructor** for two years and will send my big fashion book to you free. I will also agree to sell you any pattern you want thereafter for 5 cts. I can sell them for 5 cents because I buy them by the thousand and don't make any profit. I don't want the profit. I want your subscription to **The Home Instructor**. You will save many times the cost of my offer in a year. Write to-day. **A. OTIS ARNOLD, Dept. B Quincy, Ill.**

APPLETON, WIS. Sept. 4, 1908.  
THE A. I. ROOT CO., Medina, O.  
Gentlemen—I wish to acknowledge receipt of the two Italian queens ordered from you a few days ago. They arrived in good condition, and I must say they are fine-looking queens. Thanking you for your promptness in sending, I am Yours truly, **GEO. EICKMAN, Rt. 3, Box 4.**

Fob 5 inches long, shield 1 1/2 inches square

## Watch Fob Free

### YOUR CHOICE OF CANDIDATES BRYAN OR TAFT

Handsome Campaign Badge you have ever seen. You may have it FREE with our compliments. This fob is made of a fine grade of seal grained Russia leather, nickel-plated buckle, beautiful mother-of-pearl shield, containing a photo of your favorite candidate, either Bryan or Taft. It is guaranteed to be just as we describe it and you will be proud to wear it. We are giving away these handsome fobs to get acquainted with you and to get you acquainted with our splendid and instructive farm paper, "FARM AND STOCK," an up-to-date magazine devoted mainly to corn and live stock. The Watch Fob and a three months' trial subscription given you absolutely free on receipt of 10 cents in coin or stamps to pay for mailing. **FOR SALE.**—It will pay to get our special proposition. **A. G. WOODMAN & CO.,** Grand Rapids, Mich.

## QUEENS of MOORE'S STRAIN OF ITALIANS

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardiness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the *Bee-keepers' Review*, Flint, Mich., says, "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, 75 cts. each; six, \$4.00; doz., \$7.50. Select untested, \$1.00 each; six, \$5.00; doz., \$9.00.

I am filling orders by return mail.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

J. P. Moore, queen-breeder, Rt. 1, Morgan, Ky.

## Italian Queens

**GOLDEN AND CLOVER STOCK.**

Choice queens, 75 cts. each; six for \$4.00, or \$7.50 a dozen

GEO. W. BARNES, Box 340, Norwalk, O.

## Golden Italian Queens, 75c Six for \$4.00.

Mailed promptly. Safe arrival and satisfaction guaranteed. Circular.

J. B. CASE, . . . Port Orange, Fla.

## Westwood Red-clover Queens

Are the bees that got the honey in 1907.

Better try them for 1908. Nuclei and full colonies a specialty. Price list on application.

HENRY SHAFFER, 2860 Harrison Ave., Sta. L, Cincinnati, O.

## NOW IS THE TIME

to buy your queens for fall increase. I can mail promptly young vigorous queens—Italian, Carniolan, Banat, and golden. Prices, untested, 75 cts.; \$8.00 per dozen; tested, \$1.25 each; \$12.00 per dozen.

Circular free.

Grant Anderson, Sabin, Tex.

## Taylor's Strain of Italians IS THE BEST.

Long tongues and goldens are the best of honey-gatherers; 19 years a specialty, breeding for the best honey-gatherers. Untested, 75 cts. each, or \$8.00 a dozen; tested, \$1.00 each, or \$10.00 a dozen; select tested, \$1.50 each. Breeders, the very best, from \$3.00 to \$5.00 each. We sell nuclei in full colonies. Bees in separate yards. Safe arrival guaranteed. Send all orders to

J. W. TAYLOR & SON, Beeville, Bee County, Texas.

## ITALIAN QUEENS

Fine 3 and 5 banded queens till Nov. 15, untested, only 60c or \$6.00 a doz.; extra fine queen, \$1; tested, \$1.25. Full colonies in 8-fr. hive, with queen, \$5.50; 3-fr. nucleus, with queen, \$2.75. Safe arrival guaranteed. Directions to introduce go with queen. Price list free.

J. L. FAJEN, ALMA, MO.

## RED-CLOVER QUEENS

200 lbs. honey from my breeding colony. Mostly red-clover honey. Untested queen, 75 cts.; tested, \$1.00; doz., \$7.00. Four-frame nuclei and fine tested queen, \$4. G Rutzann, Biglerville Pa.

## ITALIAN QUEENS

Large prolific queens of the Moore strain. Nice to handle, and good workers. Untested, 60c; 6 for \$3.25; doz., \$6.00, now going by return mail. S. F. TREGO, Swedona, Ill.

## Queens ITALIAN Queens BY RETURN MAIL.

Untested, 60 cts. each; 6 for \$3.25; tested, \$1.00 each; 6 for \$4.75. 150 colonies of bees for sale. Write for prices.

E. A. SIMMONS, . . . GREENVILLE, ALA.

## Extra Fine QUEENS

Queens of the Doolittle-Moore cross, \$2.00 each; 3, \$5.00; 6, \$9.00. Queens of the Moore strain, \$1.00 each; 6, \$5.00; 12, \$9.00. All queens warranted purely mated.

W. M. PARRISH, Rt. 8, Lawrence, Kan.

W. M. PARRISH, LAWRENCE, KAN., Sept. 12, 1907.

Dear Sir:—The queen I received of you in 1906 yielded, this year, twice as much surplus as any other one colony I have.

CLARENCE A. HALL.

## CARNIOLAN, BANAT, AND CAUCASIAN QUEENS

Home-bred, \$1.00 each; five at 80c each; Imported, \$4.00 each. FRANK BENTON, . Box 17, . WASHINGTON, D. C.

# WHAT'S THE USE

OF HAVING FINE HONEY IF IT IS IN POOR PACKAGES?

If you are among the fortunate ones who have secured a good crop of honey, surely you will not be so unbusinesslike as to sell it in second-hand or inferior cases. Your honey will sell far easier in nice new cases or tins. WE HAVE THEM. . . .

John Nebel & Son Supply Co., High Hill, Mont. Co., Mo.

# ITALIAN QUEENS

And nothing but Italians. An improved superior strain is what QUIRIN-THE-QUEEN-BREEDER raises. Stock is Northern-bred and hardy—not a single colony lost during the past winter; have five yards, all wintered on summer stands. Am now taking off supers of nice white-capped clover honey. Prices of bees and queens as per below:

| Prices of Queens after July 1. | 1     | 6      | 12      |
|--------------------------------|-------|--------|---------|
| Select queens                  | \$ 75 | \$4 00 | \$ 7 00 |
| Tested queens                  | 1 00  | 5 00   | 9 00    |
| Select tested queens           | 1 50  | 8 00   | 15 00   |
| Breeders                       | 3 00  | 15 00  |         |
| Straight five-band breeders    | 5 00  |        |         |
| Two-comb nuclei, no queen      | 2 25  | 12 00  | 22 00   |
| Three-comb nuclei, no queen    | 3 25  | 18 00  | 32 00   |
| Full colonies on eight frames  | 5 00  | 25 00  |         |

All queens now go by return mail Safe arrival and pure mating guaranteed. We employ 400 to 500 swarms. Can furnish bees on L. or Danz. frames. Add price of whatever queen is wanted to nuclei or colony. No order too large, and none too small. Over 20 years a queen-breeder. Address all orders to

QUIRIN-THE-QUEEN-BREEDER, Bellevue, Ohio.

## 5000 QUEENS

of the famous 3-banded LONG-TONGUE RED-CLOVER STRAIN OF ITALIAN BEES is what I want to sell this season.

My bees GATHER HONEY if there is any to get; ARE LITTLE inclined to swarm and sting; they please such people as The A. I. Root Co., R. F. Holtermann, W. Z. Hutchinson, Morley Pettit, etc., and if they don't please you, send in your kick.

Queens of all grades now ready.

|                        | 1                | 6      | 12     |
|------------------------|------------------|--------|--------|
| Untested queens        | \$1.00           | \$5 00 | \$9.00 |
| Select untested queens | 1 25             | 6 00   | 11 00  |
| Tested queens          | 1 50             | 8 00   | 15 00  |
| Select tested queens   | 2 00             | 11 00  | 20 00  |
| Breeders               | \$5.00 to \$7.00 |        |        |

W. O. VICTOR (Queen Specialist), Hondo, Tex.

## GOLDEN-ALL-OVER and RED-CLOVER ITALIAN QUEENS

My stock is the result of years of careful selection, and is equal to any in the country. The prices are only such as to insure long-lived, prolific queens, whose workers will be hardy and good honey-gatherers. Write for 1908 circular. PRICES.

|                                                  | 1      | 6      | 12     |
|--------------------------------------------------|--------|--------|--------|
| Untested                                         | \$1.00 | \$5.00 | \$9.00 |
| Select untested                                  | 1 25   | 6 50   | 12 00  |
| Tested, \$1.75 each; select tested, \$2.00 each. |        |        |        |

Positively all orders filled in rotation.

Wm. A. Shuff, 4426 Osage Ave., Philadelphia, Pa

## Long-tongued Red-clover Queens

Bred by their Originator

Do you want to get some specimen queens of the world-famous red-clover stock of Italian bees? Then buy from me, because I am the originator, and surely ought to know how to breed them in their purity. When you get them from me you know you have the real strain. For years I have devoted time and skill to this stock, trying to reach perfection. I can submit many splendid testimonials in favor of this stock to show my work has not been in vain. Try them, and YOU will be pleased also. I endeavor to please the practical man looking for definite results in dollars and cents. Many years' experience as head apiarist of The A. I. Root Co. enables me to fill the most exacting order with complete satisfaction to the purchaser. Let me show you how well I can please you.

| Prices                                      | 1      | 6       |

### Honey and Wax for Sale

**FOR SALE.**—To reduce stock I offer for sale as follows: 27 cases No. 40, and 44 cases No. 43 at \$10.80 per case of two 60-lb. (new) cans. This is a raspberry-basswood blend, and is the cream of two apiaries, being extracted from select all-sealed upper stories. The partly full upper stories are being extracted by themselves (No. 38), and sold at a less price. Money can not buy better honey than this No. 40 and 44. The above honey was gathered during June and the first half of July, and was extracted the week beginning Aug. 10. This eft-on-the-hive-all-summer honey is sappy, rich, ripe. A free sample will convince you. Other lots at a less price; also a little comb honey left.  
E. L. TOWN-END, Remus, Mich.

**FOR SALE.**—150 cases of No. 1 comb honey, 15 sections in 3-inch glass, no-drip cases, 6 cases in a crate, very fine, at \$2.00 per case, f. o. b. cars here. Also 8000 lbs. clover and basswood extracted, in new 60-lb. cans, 2 in case, very heavy body and fine flavor, at 8c, f. o. b. cars here. Sample free. Also extracted in 1-lb. Simplex jars, at \$2.00 per dozen.  
W. H. TOWNSEND, Hubbardston, Mich.

**FOR SALE.**—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 9 c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order.  
LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

**FOR SALE.**—Aug. 16 we finished taking off our clover, basswood, and button-willow honey. It is principally clover, fine and rich. Delivered at station in 60-lb. square cans, two cans to case; 8½ cts. per lb. Reference, our postmaster or agent, Lakeville, St. Joseph Co., Ind., at which place address C. A. BUNCH.

**FOR SALE.**—New crop of fancy white-clover extracted honey, thoroughly ripened on the hives before extracting. None of better quality on the market. Put up in barrels, new 60-lb. tin cans, and smaller packages if desired. For prices, etc., address  
EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

**FOR SALE.**—Write for prices on clover, basswood, and buckwheat honey in 60-lb. cans and kegs; also comb honey and beeswax, and guaranteed to be pure.  
W. L. COGGSHALL, Groton, N. Y.

**FOR SALE.**—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.  
J. P. MOORE, Queen-breeder, Morgan Ky.

**FOR SALE.**—5000 lbs. of clover and amber honey in 160-lb. kegs.  
C. J. BALDRIDGE, Homestead Farm, Kendaia, N. Y.

**FOR SALE.**—5 tons of fine-quality comb and extracted. State amount you wish, and we will quote you our lowest cash price.  
QUINN-THE-QUEEN-BREEDER, Bellevue, O.

**FOR SALE.**—Choice white extracted honey, mostly clover and raspberry mixed, in new 60-lb. cans. Price on application. Sample, 10 cts.  
JAMES McNEILL, Hudson, N. Y.

**FOR SALE.**—Fancy clover extracted honey in new cans, two in a case. Send 10 cts. for sample, which may be deducted from first order.  
EARL RULISON, Rt. 1, Amsterdam, N. Y.

**FOR SALE.**—8000 lbs. raspberry, milkweed, and basswood extracted honey in new 60-lb. cans, very fine. What am I offered?  
P. W. SOWINSKI, Bellaire, Mich.

**VERY CHOICEST HONEY.**—It is rich, thick, and has that exquisitely delicious flavor of honey ripened in the comb—clover, raspberry, or basswood. HONEY-BUYERS, 'tis your opportunity to buy the very best at a low price, as I must close it out. State quantity, and I will send sample with very lowest price.  
F. B. CAVANAGH, Boscorbel, Wis.

**FOR SALE.**—Extracted clover and buckwheat honey. Write for what you want.  
D. H. COGGSHALL, Groton, N. Y.

**FOR SALE.**—Extra fancy white-clover comb and extracted honey.  
F. M. MABERRY, Lederach, Pa.

**FOR SALE.**—Fancy and No. 1 white-clover comb honey.

Breeding queens of pure Caucasian and Carniolan races—price \$3.00. Order from A. E. Titoff, Expert in Apiculture, with Russian Department of Agriculture, Kieff, Russia. Remit with orders. Correspondence in English.

## For Sale

FOR SALE.—Tasmanian necklace shells, any quantity. Sample sent. G. H. SMITH, Ramsgate, Tasmania.

FOR SALE.—Sweet-clover seed, 15 cts. per pound, postage extra. Root's supplies. ANTON G. ANDERSON, Holden, Mo.

FOR SALE.—Shipping-cases, the no-drip kind; overstocked; get our special prices. A. G. WOMFMAN CO., Grand Rapids, Mich.

FOR SALE.—A full line of bee-keepers' supplies; also Italian bees and honey a specialty. Melilotus (sweet clover) seed for sale at 8 cts. per lb. Write for catalog and particulars.

W. P. SMITH, Penn, Miss.

FOR SALE.—If you want an illustrated and descriptive catalog of bee-keepers' supplies for 1907 send your name and address to FRANK S. STEPHENS, Paden City, W. Va. (Root's Goods.)

FOR SALE.—About 1300 or 1400 cases, two five-gallon cases each, practically free from nail-holes, and were new tins when originally shipped to us. Make us an offer. CLEVELAND HEALTH FOOD CO., Cleveland, O.

FOR SALE.—360 ten-frame hives complete, \$1.00, as follows: One hive-body with ten wired combs on full sheets of foundation, H. frames; one Danz super trimmed with full sheets of foundation; lid and bottom; Root's goods, in good condition. Also one Root observatory hive, new, complete, \$4.00. All must be sold at once. H. A. ROSS, 1709 Upper Second Street, Evansville, Ind.

## Bees and Queens

FOR SALE.—75 first-class colonies of bees, mostly in ten-frame hives. J. D. HOLDENER, Carlyle, Ill.

FOR SALE.—Fine select untested Red-clover and Golden Italian queens, 60 cts. each. F. M. MAYBERRY, Lederach, Pa.

FOR SALE.—100 colonies at Horseheads, N. Y., complete for extracted honey, \$2.50 each. WM. CARDER, Constance, Ky.

FOR SALE.—Improved Italian and Golden Mortgage-lifter queens. Tested and untested, \$1.00 to \$3.00. BEST THE BEE-MAN, Slatington, Pa.

FOR SALE.—Italian, Carniolan, and Caucasian queens. Untested, 75 cts.; 12, \$8.50; virgins, 40 cts.; 12, \$4.50. Stamps not accepted. EDWARD REDDOUT, Baldwinville, N. Y.

FOR SALE.—First-class apiary of 120 colonies with all supplies. Write for particulars to J. B. HALL, Box 595, Woodstock, Ont., Can.

FOR SALE.—300 surplus young tested queens, red clover or golden, 50 cts. each as long as they last. H. A. ROSS, 1709 Upper Second St., Evansville, Ind.

FOR SALE.—Selected young Italian queens, bred for superiority in honey production. Single queen, 75 cts.; 6 for \$4.00; one dozen, \$7.50. Also golden-all-over, Cyprians, Carniolans, and Caucasians. JULIUS HAPPEL, 414 Fourth St., Evansville, Ind.

FOR SALE.—Italian bees and queens now ready. Untested, \$1.00; tested, \$1.50. Bee-keepers' supplies, Root's goods. Send for prices. Eggs from Silver-laced Wyandotte poultry. N. V. LONG, Biscoe, N. C.

FOR SALE.—500 colonies of bees in lots to suit purchaser, at a bargain. Fine condition; no disease. Will ship, or furnish good locations. No wintering problem here. For particulars write B. F. YANCEY & SON, Angleton, Texas.

FOR SALE.—250 colonies of bees in ten-frame hives at \$2.75 per colony; no disease; fixtures for comb and extracted honey cheap; also 22 acres of land; first-class buildings, and improvements. If not sold by Jan. 1 a reliable man is wanted to rent or run bees and farm on shares. J. H. ZEINER, Bard, Ark.

FOR SALE.—Bees, 300 full colonies, first-class hives, each \$3.75; three for \$11.00. No disease. Must sell this fall. Empty Dov'd hives, \$1.00; supers, 25 cts.; 4-fr-mc extractor, \$18.00. Other supplies. Extracted basswood honey, 10 cts. per lb. L. M. GULDEN, Osakis, Minn.

FOR SALE.—Moore's strain and golden Italian queens, untested, \$1.00; six, \$4.00; twelve, \$7.00. Carniolan, Banat, and Caucasian queens, select, \$1.00; six, \$5.00. Tested, any kind, \$1.25; six, \$6.00. Choice breeding queens, \$3.00 each. Circular free. W. H. RAILS, Orange, Cal.

FOR SALE.—350 colonies of bees in first-class order on easy terms. I would also sell an 82-acre farm, all in the best cultivation; three acres in orchard and good out-buildings. I would sell the same in 5 and 10 acre tracts on part payments. It is two miles from Caldwell, where the great government project is established. Caldwell is the liveliest city in Idaho. Great work is developing. I also offer a 9-room house and barn, and one block within half a mile of the main street, where I keep one of my yards of fancy poultry, also one river-bottom farm, 240 acres, rich soil, and good water-right; good location for bees. Write for particulars, as I can give you any information desired, for I have been in this country 24 years. OTTO GEISER, Caldwell, Idaho

## Real Estate for Bee-keepers

**PECOS VALLEY** of New Mexico lands are coining \$50 to \$65 net per acre per year from alfalfa. Forty-five thousand acres of alfalfa in bloom five times a year, surrounding Artesia, means *honey for the bee-keeper*. Live in an ideal fruit country, where the largest artesian wells in the world constantly pour out their wealth. Artesia, the future Rose City, already has the famous "Mile of Roses." Homeseekers' excursions the first and third Tuesdays of each month. Agents wanted, to accompany parties. Write to-day to R. M. LOVE, General Agent, Artesia, N. M.

**FOR SALE.**—Delaware farm, public road; good buildings, good water; fruit, wood; rural delivery; school, churches, stores, mills, railroad depot, canneries, blacksmith shops, all convenient; an ideal place for bees, poultry, fruit, and trucking.

L. A. LUDWIG, Maryland, Md.

**HOMES.**—Deep rich soil, abundance of water for irrigation; best market and climate; wheat, oats, barley, rye, alfalfa; red, alsike, and white clover; vetch; small and large fruits; chickens, hogs. Bees average 100 lbs. per colony.

E. G. GIBSON, Oxford, La Plata Co., Col.

**FOR SALE.**—Farm of 14 acres near city of 20,000; good soil, market, and bee pasture. L. C. HOOK, Richmond, Ind., Rt. 3.

## Educational.

Any one interested in the education of a child not yet in school, send name and address to

E. WHITNEY, Flemington, N. J.

## KIND WORDS.

*The A. I. Root Co.:*

The tested southern-bred queen was received in good condition, and she is a fine one too. Enclosed find check.

Lime Kiln, Md., Sept. 3.

J. F. MCABEE.

*The A. I. Root Co.:*

I received the Italian breeding-queen in good condition. Please forward to me a Caucasian as early as possible.

PETER JAMES HURST.

Nelson, St. Ann's Bay, Jamaica, Aug. 19.

*The A. I. Root Co.:*

Referring to the bees ordered for Judge Woods, of Marion, S. C., I beg to say that they arrived several days ago by express, and at Judge Woods' request I went over to Marion to assist in hiving them. The shipment of hives, etc., from Philadelphia, though badly delayed in transportation, reached Marion in *perfect condition*, and we had no difficulty all in getting every thing in shape. The bees themselves seemed to be in *perfect condition*. We found only *eight or ten dead bees* in each nucleus. After my experience with black or hybrid bees which I found on my place when I leased it, I was hardly prepared for the extreme gentleness of the Italians, even after all I read about them. With the exception of one sting which I received by mashing a bee with my hand while placing the hand on the bottom of the cage, none of them offered to sting. They were very quiet, even after thumping out those that adhered to the inside of the cages.

L. W. MCLEMORE.

I am now reading my second copy of GLEANINGS, and it is beginning to take some of the wrinkles out of my forehead. I have two stands of bees, and they have filled 120 sections already. Our bees will make honey here till November; no frost very often until then.

Beaver, Ore.

A. F. GARDNER.

THE ABC OF GETTING WELL, ETC.

Please send me 100 copies of your health leaflet. It certainly is generous of you to give them free. For some years I have given a year's subscription to the *Practical Farmer* to different people who, I thought, would be benefited. Your leaflets will enable me to reach a great many more people. It certainly is a great work that you and the *Farmer* are doing.

Barium Springs, N. C., Sept. 7.

W. B. BAILEY.

A KIND WORD FOR "OUR HOMES" OF MORE THAN 20 YEARS AGO.

Mr. Root:—I have been reading one of your sermons, "What doth the Lord require of thee but to do justly, and to love mercy, and to walk humbly with thy God." It is in GLEANINGS for 1886. A friend gave me a lot of them, also a subscription for the

year 1908. It was just the kind of sermon I needed, and it helped me very much. I have much to do on Sunday. The children come home, also my mother and husband's brother. They work away, and like to get home for one day in a week. Of course, it is hard; but I like to have them come, and I guess it is the Lord's work and my duty. Sometimes I have doubted and wondered if it were sinful, but I doubt no more. May you write many more of those good stories.

HATTIE E. GRAVES.

Walpole, N. H., June 21, 1908.

## "CHICKEN" BIBLE.

In yours for Aug. 15, one of your subscribers asks for a "chicken bible." I don't think he could get one to compare with GLEANINGS, as I have had some eight years' experience with the "chicken bible" as he calls it. The one that, in my estimation, comes nearest to the above, is *Poultry*, published by Miller Purvis, Peotone, Ill. It is bright, clean, and nicely printed. I have no connection with it.

I get more eggs without males. I have had as many as 270 eggs per bird. I am in the business for the love of it, and not to make money.

R. F. HERRING.

Chicago, Aug. 21.

## Convention Notices.

A meeting of the Adirondack Bee-keepers' Association will be held at Glens Falls, N. Y., Oct. 1, in the parlors of the Hotel Ruliff. All interested in apiculture are invited to be present.

Glens Falls, N. Y.

ARTHUR W. CARY, Sec.

The annual meeting of the Northern Illinois and Southern Wisconsin Bee-keepers' Association will be held in the courthouse in Rockford, Ill., on Tuesday and Wednesday, Oct. 20 and 21, 1908. All interested in bees are invited to attend.

Cherry Valley, Ill.

B. KENNEDY, Sec.

The annual meeting of the Western Illinois Bee-keepers' Association will be held on Friday, Sept. 18, in the county court-room at Galesburg, Ill. All interested in bees are earnestly requested to attend and help make this a profitable meeting.

Altona, Ill.

W. B. MOORE, Pres.

Bee-keepers in Alabama, Florida, Georgia, Mississippi, and Tennessee, also points along the route, who will join the party of a carload to attend the National Convention at Detroit, Mich., Oct. 13—15, will please write us for rates, etc. This promises to be the best convention yet, and is to your interest to attend.

Elamville, Ala.

WM. S. MCKNIGHT.

The annual meeting of the Kansas State Bee-keepers' Association will be held at Hutchinson, Sept. 16, 17. The first session will be held at 2:30 on the 16th. This meeting occurs during the State fair, and it is hoped that a large number of bee-keepers will be present. Several noted bee-keepers from different parts of the country have promised to attend.

Topeka, Kan.

O. A. KEENE, Sec.

## MEETING OF TENNESSEE BEE-KEEPERS.

The Central Tennessee Bee-keepers' Association met at the rooms of the Nashville Board of Trade on August 8, with about thirty members present. Pres. J. M. Davis occupied the chair. The meeting was opened with prayer by Mr. Ayres, of Cedar Hill. Nine new members were enrolled.

Among the subjects discussed were the following:

Cement hive-stands; home marketing of honey; transferring bees, etc.

Mr. Leslie Martin, of Lebanon, read a paper entitled "Further Experience with Caucasian Bees." He is of the opinion that the Caucasians have held their own with the average Italians in regard to honey-gathering. They are much more gentle, easier handled, and but very little more given to swarming than the Italians. However, he thinks it will take several years, through both good and bad seasons, to test them thoroughly.

J. M. Buchanan spoke on "Bees and Honey at the State Fair." It was decided to place a nice exhibit at the State Fair this fall, as this is one of the best methods of advertising our products.

A committee was appointed to confer with Southern bee-men in regard to getting up a carload of bee-keepers to attend the National convention at Detroit. It was decided to extend an invitation to the National Bee-keepers' Association to hold its 1909 convention at Nashville, Tenn. Our local association has now about fifty members, and at our meeting last spring we voted to join the National in a body.

Most of the members reported a rather short crop this year, owing to too much rain during the flow from clover.

The convention adjourned to meet on the second Saturday in March, 1909, on which date occurs the annual election of officers.

Franklin, Tenn., Aug. 17.

J. M. BUCHANAN, Sec.

# SPECIAL NOTICES

BY OUR BUSINESS MANAGER

## NEW MANAGER IN OUR NEW YORK OFFICE.

Mr. L. W. Boyden, who has been manager of our New York office for the past three years, and previous to that in charge of our Chicago office for some time, has come to Medina to take up work in the home office. The new manager in charge at New York, beginning Sept. 1, is Walter E. Thorndyke, a nephew of our treasurer and business manager. Mr. Thorndyke was in the employ of the company for seven years, most of the time in the office, first as stenographer, then as assistant book-keeper. For two years past he has been with the American Steel and Wire Co. in their Cleveland office. He returns to the service of the company with increased responsibilities. We commend him to the patrons of our New York office, with confidence that his previous training fits him for efficient service.

## QUEENS.

We have a large number of queens, untested, tested, and higher grades, ready for immediate mailing, safe arrival guaranteed to any point in the United States, at our regular prices. For untested, \$1.00 each; 6 for \$5.00; tested queens, \$2.00 each; 6 for \$10.00; select tested queens, \$3.00 each; 6 for \$15.00.

The above refers to our home-bred Italian stock, red clover, leather-colored strain. Commenting on the queens he had received of us, Mr. E. R. Longenecker, of Lytle, Texas, to whom we have sent fifty queens this season, writes: "There is no question about your queens being superior, and their progeny excelling as honey-gatherers on any flora that I have seen them work. I first bought six queens of you in 1903, and have ordered a number of times since, and have no kick coming." We are sending queens by first mail; and as the season is nearly at a close, orders ought to come in at once to be sure of getting this stock, for they shall be unable to ship after cold weather has fairly set in.

## Special Notices by A. I. Root

### THE WRIGHT BROTHERS AND THEIR AERIAL FLIGHT UP TO DATE.

I suppose you all know that our two friends, the Wright Brothers, are not only "up in the air," but they are, perhaps, standing out more prominently before the whole wide world than and other two persons now living. Not only are the accounts of their successes found in almost every magazine and daily paper, but almost every periodical of any sort is giving them recognition. As we go to press, Orville has made his third long flight, each one of about an hour or a little more. He has been able to manage it perfectly, making figure 8's as well as circles, and making turns with the wind blowing at the rate of ten to fifteen miles an hour. It is true that it staggered the machine somewhat when he turned about from going with the wind, and proceeded directly against it; but after he had become accustomed to handling the craft he made each turn more easily than the one before it. Fifty-seven times the machine came around to the starting-point during a period of 70 minutes and 24 seconds. After this he took Lieut. Lahm, the army's aeronautic expert, along with him for a flight of 6 minutes and 26 seconds. This was the first time he had been accompanied by a passenger in the present series of tests, and the result was the breaking of all previous records for that sort of flight. The first time that he succeeded in making a flight of almost an hour, when his friends came around to congratulate him on his wonderful achievement, the papers tell us that he actually shed tears—yes, tears of joy to think the moment had come, after all the long years of hard work on the part of himself and his brother, when they had actually demonstrated to the world that men can fly as birds do, and make use of the air above for a general thoroughfare for trade and travel, as well as the waters and the solid ground underneath the skies. I especially admire these two young men because they have worked so slowly and carefully. When a young bird essays to make its first flight from the nest, it has to learn how to use the wonderful wings that God has given it, little by little. Well, these two men not only figured out how to build the machine by cutting and trying, but at the same time they were obliged to learn how to use it, just as the bird has to learn by actual practice how to use its wings. We may congratulate them on having had the good sense and steadiness of mind to work so carefully that no accident worth mentioning has ever happened to either of them; and above all and over all I wish to emphasize the fact that from beginning to end they have steadily refused to use their machine on Sunday, or even work with it that day. They have also set an example before the youth of our land and others by abstaining from the use of intoxicants in every form. When I

was taking breakfast with them one morning I ventured to ask why it was that neither of the brothers accepted coffee. I think it was Wilbur who replied with his peculiar pleasant smile:

"Mr. Root, we expect to make some flights this morning, and we have learned by experience that our heads are clearer and our nerves steadier if we abstain from coffee at breakfast."

Is it really true that the time is coming (or has come) when the world will accord and pay a premium to those who live pure and temperate lives as do the Wright Brothers?

Many are just now asking the question why these brothers do not take a straight flight, say from one city to another, and let the whole wide world see what they are doing. I presume it will be better just yet for them to keep the machine reasonably near the workshop where their tools and appliances are kept. Another thing, they are just now negotiating the sale of one of their machines to France, and another to the government of the United States. When these preliminary tests are completed we may expect to see these machines, or similar ones, flying over the whole wide world, perhaps including even the north and south pole that have been so much talked about.

### STILL LATER IN REGARD TO THE WRIGHT BROTHERS.

From the *Woman's National Daily* we clip the following:

#### CAN EQUAL BROTHER'S RECORD?

LE MANS, Sept. 13.—Wilbur G. Wright says that defects in his motor are all that have kept him from equaling the flights made by his brother Orville at Ft. Myer, in America. "My motor has not worked smoothly yet, but I expect to get it in shape soon. Just as soon as I find that it is all right I expect to make a flight that will be as startling as that of my brother. There is no reason why I should not, as our machines are practically the same."

From the same paper we learn that Orville Wright, when asked why he did not stay up still longer during the last and longest flight, replied as follows:

"Well, the fact is I came down solely because I was tired and hungry. I could have continued the flight another hour just as easily. I knew by the figures chalked on the shed-roof by my mechanic that I had bettered my previous record, and I thought that was enough for one day."

It seems that the city of Dayton, where the Wright Brothers have lived and experimented all their lives, has just been waking up to the importance of giving the brothers a reception or ovation on their return home. The *Dayton Herald* says in regard to the matter:

"Dayton may crumble in dust, but the name of Wright Brothers will endure as long as earth endures."

"Henceforth the names of Orville and Wilbur Wright will be enrolled beside those of Watt, Fulton, Morse, Bell, Edison, and Marconi in history's tablet of fame."

We make a further clipping as follows:

"No one read the reports of the three flights of the Dayton aeroplane with greater avidity, or discussed the accomplishment with more zeal, hope, and inspiration than did the venerable father of Orville and Wilbur Wright—Bishop Milton Wright."

"The venerable churchman fairly radiated with joy, feeling that the toil, planning, hope, ambition of years had become a scientific reality—an accomplishment that would contribute immeasurably to the material wellbeing of society. The venerable gentleman, bowed with the weight of years, looked younger, felt younger. His sons effected a revolution in science."

### "GREAT NAVIES TO MAINTAIN PEACE."

We clip the following from the *National Stockman and Farmer*:

The Emperor of Japan wants a great navy to maintain peace. The Russian Czar wants a great navy to maintain peace. The German Emperor wants a great navy to maintain peace. The rulers of France want a great navy to maintain peace. The king of Italy wants a great navy to maintain peace, and the king of England wants a great navy to maintain peace. And so multitudes of men and women are compelled to hard toil and suffering to maintain these great navies to maintain peace. Norway and Sweden and Denmark and Belgium and all the nations of South America get along very comfortably without great navies to maintain peace.

In view of the above I do not know but I shall have to swing back to where I stood first—see p. 1017, Aug. 15. If all the nations of the earth are obliged to maintain great navies to preserve peace, why can't we, especially those of us who call ourselves Christians, "cut it all out" (as the boys say) and substitute in its place "In God we trust"? Then we can consistently breathe the little prayer that ends with "Thy kingdom come; thy will be done on earth as it is in heaven."

### "GOD'S KINGDOM COMING."

On the 4th of July four of our saloons closed their doors, and on the 15th of August the other one will close and then our town will be a dry one. I would like to see them all dry.

Bevier, Mo.

V. B. GUFFEY.

# 20 AMERICAN GIRLS FREE

Country Girls, City Girls, Western, Southern, and Eastern Girls; Skating, Riding, and Bathing Girls, and many other views of the beautiful American Girl—all free; also a membership to the Post-card Exchange.

This famous set of souvenir post cards is considered the most popular set ever issued. Twenty different views of the beautiful American Girl; all worth framing—the gem of a post-card collection. I want to place a complete set in the hands of every American woman free.

## MY SPECIAL OFFER

In order to place *Up-to-date Farming* in your home I will send it to you for **three months for 10 cents**, and include, with my compliments, a **complete set of American Girl post cards**. Every woman should read the family and household pages of *Up-to-date Farming*; the boys will be interested in the stories and puzzles, while the men will read its agricultural and marketing features with much profit.

Remember, 20 souvenir post cards (American Girl set) and a three months' subscription to *Up-to-date Farming*, all for 10 cents (stamps or silver).

**Garrett Wall, Up-to-Date Farming, Indianapolis, Ind.**

## Shipping-cases

for any number or size of sections desired. These cases are made of fine white basswood, and the workmanship is first class. Owing to the shortage in the honey crop last year we have a good stock on hand and can make immediate shipment.

Twelve-inch case, with follower, to hold 24; or eight-inch case, with follower, to hold twelve beeway sections. shipped when no size is mentioned. All cases single tier unless otherwise ordered.

## Honey-packages in Tin.

Standard packages for storing and shipping extracted honey. Less chance for leakage or taint from wood; being square they economize space. Five-gallon cans boxed two or one in a box; gallon cans 10, ½-gallon cans 12 to box. Five ½-gallon cans not boxed if desired. Prices on application for any quantity.

Place your order now; prices and prompt shipment guaranteed.

GRAND 1908  
OFFER**

**NEW  
LUMBER**

**FIFTY MILLION FEET  
AT REDUCED  
PRICES**

Bought at Forced Sales from Manufacturers. It makes us Headquarters for Thousands of Genuine Bargains in Lumber and Building Supplies. We save you money.

**BIG  
SPECIAL  
SALE**

**SAVE 30 TO 60 PER CENT. BUY DIRECT. BUILDING SUPPLIES OF EVERY KIND**

The Chicago House Wrecking Co. Purchased at forced sales, 50,000,000 feet of new lumber. We are making special concessions to those who buy at once. Our prices today are far lower than prices have been for years. Order now for immediate or future use. Quick action will save you big profits. Remember prices elsewhere which are even now high, are bound to rise. We can quote you 30 to 60 per cent better prices for the same lumber than your local dealer. We guarantee every carload to be exactly as represented. Closest inspection of our lumber stock invited.

Call at our warehouse and yards at Chicago and see the lumber we are offering and you will recognize that it is all we say of it. Make your own selection and see it loaded. It is not necessary to come to Chicago, however, unless you wish to. We can fill your order by mail with just what you want and guarantee you absolute satisfaction. Ours is the largest direct to the

consumer lumber headquarters in the world. We sell millions of feet annually. Orders filled from every part of the United States. No matter where you live you can save money by supplying your building wants here.

We do not figure fancy prices, but quote figures that command your patronage. Whether your order is large or small we can save you money on it. Our tremendous business of millions of dollars annually is your best guarantee of complete satisfaction of every purchase made from us. In our enormous stock of new lumber of every kind we have just what you need for every purpose. Don't buy a stick of material until you get our prices. We offer you everything in the lumber and building supply line needed for residences, farm homes, stores, churches, barns, outbuildings of every kind, sidewalks and fencing. In short any kind of a structure requiring lumber, at from 30 to 60 per cent less than your local dealers or lumber yards ask for it.

**IMPORTANT! Send Us Your Lumber Bill For Our Estimate**

Make up a list of what you need. Send it to us for our price. If you are putting up a building of any kind whatsoever let us figure with you. Our prices talk louder than words. Have your carpenter or contractor send us your list of what is needed if he has charge of your building. Don't pay exorbitant prices to the lumber trust with their long line of lumber yards all over the country. Don't let the local dealer soak you with his heavy profit. Remember: Chicago House Wrecking Company buys millions of feet at a time under circumstances of forced sales which means sacrificed prices and enables us to sell even as low as cost without loss. You take no chances in dealing with the Chicago House Wrecking Company. Whether for \$100,000 your order will be filled carefully. Our lumber and supplies are guaranteed exactly as represented. If you have no need for a whole carload yourself get your neighbors to club in with you. By buying a carload you can save all kinds of money on freight charges.

We have railroad trains running through our main warehouses and buildings and can load a car to good advantage to you. You can include in this same car, pipe, plumbing material, roofing, wire, fencing, furniture, hardware and merchandise of every kind.

We also furnish you building and barn plans absolutely free upon request. Write us for any information or advice you want and we will have our staff of architects answer every inquiry promptly. Our free book of plans is sent if you mention this paper. We simplify your building proposition.

Our business demands quick action. We must keep our stocks moving. This means prompt shipment—no annoying delays. Let us help you lay out your plans. We will relieve you of every detail. That is what our Special Builder Service is for. Be sure and send us your lumber bill for our estimate. Feel free to write for anything you want to know along the line of building supplies, furnishings, etc.

**WE PURCHASE

## Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

### EASTERN GRADING-RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**A No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

### NEW COMB-HONEY GRADING-RULES ADOPTED BY THE COLORADO STATE BEE-KEEPERS' ASSOCIATION.

**No. 1 WHITE.**—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 1 LIGHT AMBER.**—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separated honey to average 21 pounds net per case of 24 sections; no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 2.**—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separated honey to average not less than 19 pounds net.

Cases of half-separated honey to average not less than 20 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 21 pounds net per case of 24 sections.

**INDIANAPOLIS.**—The demand for the best grades of honey is good. Producers are offering fancy white comb honey at 12½; No. 1 white at 12; white-clover extracted, in five-gallon cans, at 7; very little demand for amber at any price. Many bee-keepers seem to be holding their honey for higher prices. Beeswax is steady at 28 cts. cash, or 30 in exchange for merchandise.

Sept. 21.

WALTER S. POWDER, Indianapolis.

**DENVER.**—We quote No. 1 white comb honey, per case of 24 sections, \$3.15; No. 1 light amber, \$3.00; No. 2, \$2.85; strained and amber extracted, 6½ to 7½; light amber, 7½ to 8½; white extracted, 8½. We pay 24 cents for clean yellow beeswax delivered here. Owing to a large supply of fresh fruit in this section the demand for comb honey is light at present.

Sept. 19.

THE COLORADO HONEY PRODUCERS' ASS'N.,  
Denver, Col.

**CINCINNATI.**—The marked decrease in the demand and consumption of honey this season is not due to an oversupply; but after careful investigation of the conditions we find there are two causes. In the first place there was more white comb honey shipped last year from the West into the Eastern markets than could be sold, and even to-day there are stacks of it still remaining in every market of any importance. On the other hand, the consuming trade has not wanted as much comb honey as was supposed would be the case, and for these reasons that article is going begging. Fancy and No. 1 comb honey are selling at 12½ to 16. Lower grades must be sold at a sacrifice. The extracted-honey market is experiencing the same conditions, and is undergoing the same ordeal. Quote amber honey at from 6½ to 7 in barrels, according to the quality and quantity purchased. White clover is selling at from 7½ to 9½, according to the quantity.

For beeswax, from good to choice, we are paying 27 cts. delivered here. This must be free from dirt.

Cincinnati, O., Sept. 17, 1908. THE FRED W. MUTH CO.

**SCHENECTADY.**—New crop is coming forward rather slowly, and quality is hardly up to the standard. Buckwheat is a short crop in this locality. We quote fancy white, 15 to 16; No. 1, 13 to 14; mixed and buckwheat, 11 to 12; extracted, light, in kegs and 60-lb. cans, 7 to 9; dark, 6½ to 7½. Beeswax, 28 to 30.

Sept. 18.

CHAS. MCCULLOCH,  
Schenectady, N. Y.

**BUFFALO.**—Demand for honey here is just fair, not what it ought to be. Prices are not too high; hard times is the reason, I think. I look for dull low prices all the season. No. 1 to fancy white comb, 14 to 15; No. 2, 10 to 12; extracted, white, 6½ to 7½; dark, 6 to 6½. Beeswax, 28 to 30. Tumbler honey, 85c to \$1.00 per doz.

Sept. 19.

W. C. TOWNSEND,  
Buffalo, N. Y.

**NEW YORK.**—Receipts of comb honey are now quite heavy, from New York and Pennsylvania mainly. Demand is fairly good, especially for No. 1 and fancy white; also for fancy buckwheat. Lower grades are not in as good demand. We quote fancy white, 15; No. 1, 13 to 14; No. 2, 12; dark, 10 to 11. For extracted honey the demand is improving, especially for Californian, which, on account of the short crop, is ruling rather high in price. We quote California white sage at 9; light amber, 8; amber, 7; white clover, 8 to 8½; light amber, 7 to 7½; dark, 6½. Very little doing in beeswax; good supply, and market easy at 28 to 29.

Sept. 21.

HILDRETH & SEGELKEN,  
New York.

**PHILADELPHIA.**—This market is well supplied with local honey, the fall crop having been gathered at this time. It is one of the largest we have had here for years. Outside of the Eastern States, later reports show the crop is much below the first reports. This condition makes our market very unsettled. We quote: Fancy comb honey, 15 to 16; No. 1, 14 to 15; amber, 12 to 13; extracted, white, 7 to 8; amber, 6 to 7. Beeswax, 28.

Sept. 21.

WM. A. SELSKY,  
Philadelphia, Pa.

**TOLEDO.**—Extra fancy Ohio and Michigan clover honey, in no-drip shipping-cases, brings 15 to 16 cts.; No. 1, 14½ to 15½; No. 2, 14. Extracted, in barrels is bringing from 7 to 7½; cans the same. Beeswax, 28 to 30. These are our selling prices. The demand for honey has not been very brisk, owing to the large fruit crop, and most dealers seem to have carried over quite a quantity of honey from last year. However, we look for a better demand within the next 60 days. Prices will be considerably lower than last year. Arrivals of new honey exceed the demand.

Sept. 18.

THE GRIGGS BROS. & NICHOLS CO.,  
Toledo, O.

**COLUMBUS.**—The movement of honey has not been up to the usual volume which takes place at this time of the year, and we presume it is due to two causes—in the first place, the supplies throughout Ohio this season were unusually large, and the great part of our grocery trade received honey from local growers. In the second place, quite a good deal of western honey was carried over by the retail merchants, and it has made them rather backward about buying. Our market to-day is as follows: Fancy white, 15; No. 1 white, 14; No. 2 white, 12; amber, 10.

Sept. 21.

EVANS & TURNER,  
Columbus, O.

**PITTSBURG.**—At this writing very little honey is in the hands of the jobber; but several large shipments are moving this way. Demand is good, prices firm. Jobbers are getting from the retail merchants \$4.00 per case of 24-sections, fancy and No. 1; white clover or alfalfa, \$3.75, jobbing, buckwheat, \$3.75; water-white extracted in 60-lb. cans, 8½ to 10; amber, 7 to 8½.

Sept. 18.

J. A. W.

**BOSTON.**—We quote fancy white comb honey at 16 to 17; No. 1, 15 to 16; extracted, white, 10; light amber, 8; amber, 7; in barrels, 6 to 7. Beeswax, 30.

Sept. 20.

BLAKE-LEE CO.,  
Boston, Mass.

# SUBSCRIPTION OFFERS...

**Offer No. 1B.** A B C OF BEE CULTURE (1908 edition), and GLEANINGS one year for \$2.25.

**Offer No. 2B.** HOW TO KEEP BEES, and GLEANINGS one year for \$1.50. A hand-book for those who keep bees for happiness and honey, and, incidentally, for money. It serves as an introduction to more extended manuals, such as our A B C.

**Offer No. 3B.** FORTY YEARS AMONG THE BEES, by Dr. C. C. Miller. In this handsome book the author genially describes his methods and ideas in producing vast quantities of fancy comb honey. He has a happy knack of making every thing very plain and easily understood. He tells all he knows. This book and a year of GLEANINGS for \$.75.

**Offer No. 4B.** STANDARD ROOT SMOKER, and GLEANINGS one year, \$1.85. One of the best smokers made, both in principle and construction.

**Offer No. 5B.** WHAT TO DO AND HOW TO BE HAPPY WHILE DOING IT, by A. I. Root. Herein doth our old friend give some practical ideas about making a living independently around one's own home. It suggests many ways of making a living for men with little capital. With GLEANINGS for a year and this book the charge is \$1.35.

**Offer No. 6B.** A copy of MINK-TRAPPING, and GLEANINGS one year, \$1.30. The methods as published are those of experienced trappers from all parts of the country.

**Offer No. 7B.** A copy of FOX-TRAPPING, and GLEANINGS one year, \$1.30. A book of instructions telling how to trap, snare, poison, and shoot. A valuable book for trappers.

**Offer No. 8B.** BEE GLOVES. One pair cloth bee-gloves, with or without fingers, with GLEANINGS one year, \$1.35.

**Offer No. 9B.** One F. F. FOUNTAIN PEN No. 2, with GLEANINGS one year, \$1.50.

*The above prices are all postpaid.*

Canadian postage on each of the above offers, 30 cts. per year extra.

Foreign postage on each of the above offers, 60 cts. per year extra.

## THE A. I. ROOT COMPANY, MEDINA, O.

# Reasons for the Price

## OF MY

# Raspberry Honey.

I ask ten cents a pound for my raspberry honey. This is slightly above the market price, but there are reasons.

In the first place, very little raspberry honey is produced. It is a novelty—something out of the ordinary—like orange-blossom honey for instance.

In addition, it is of very superior quality; so much so that it was awarded the gold medal, in competition with other honeys, at the Jamestown Exposition. It has a flavor all its own—a flavor that smacks of the wild red raspberry of the woods.

Another most important reason why I should get a good price for my honey is the manner in which it is produced. It is left on the hives for weeks after it is sealed over, and thus acquires that finish, that smooth, oily richness, that thick, rich deliciousness that can be obtained in no other way.

It costs more to produce such honey, there is not so much of it,

and it is worth more than the ordinary honey; just as big Northern Spy apples, streaked with crimson and filled with juicy spiciness, are worth more than ordinary fruit.

As a finishing touch the honey is put up in bright new 60-lb. tin cans, securely boxed, and the boxes bound with iron so that they will bear shipment; in fact, I will guarantee safe arrival in perfect condition.

For a single 60-lb. can the price is \$6.25; for two cans in a case (120 pounds) the price is \$12.00 a case, regardless of the number of cases that are taken.

If you are not acquainted with this honey, send me ten cents and I'll mail you a generous sample, and the ten cents may apply on the first order that you send.

**W. Z. HUTCHINSON, Flint, Mich.**

# HONEY-JARS

## from

# New York City

We consider the No. 25 jar with solid metal cap and waxed liner the best jar made for honey.

Gross crates . . . \$5.00; 5 gross, \$4.75 per gross.  
12-oz. screw-cap jar . . . 4.50; 2 gross, 8.25 per gross.  
1-lb. sq. jar with cork . . . 5.00;  
Italian queen . . . 1.00. Catalog free.

Apiaries, Glen Cove, L. I.

**I. J. STRINGHAM 105 Park Place, New York**

*Honey Market continued from page 1161.*

**KANSAS CITY.**—The demand for honey is quite brisk at present, although the supply is somewhat limited as yet. Strictly No. 1 white comb in 24-section cases is selling at \$3.25 per case; amber comb, \$3.00; extracted, 8 cts. per lb.

Sept. 18. **C. C. CLEMONS PRODUCE CO.,**  
Kansas City, Mo.

**CINCINNATI.**—The demand for honey has improved considerably, but no high prices have as yet been obtained. We quote No. 1 white comb honey at 14; off grades are not wanted at any price. White-clover extracted honey sells at 8 to 8½; amber, in barrels, 5½ to 6. Beeswax is selling slowly at 31.

Sept. 18. **C. H. W. WEBBER,**  
Cincinnati, O.

**ST. LOUIS.**—The receipts of new crop honey are very much in excess of the limited demand, especially comb honey, which runs very dull. Fancy white comb honey is freely offered at 12½, with very few takers. Choice amber comb honey is quotable at 11 to 12. There is absolutely no market for broken or leaking comb honey. Extracted honey is also a slow seller. The choicest amber honey is quotable at 5½ to 6 cts. in barrels, and 6½ to 7 in 5-gallon cans. Dark and inferior grades rule at considerably less.

Sept. 18. **R. HARTMANN PRODUCE CO.,**  
St. Louis, Mo.

**SAN FRANCISCO.**—The greater part of the honey crop has been shipped, and only scattering lots are now arriving. The white and water-white grades are in good demand and there is a fair demand for the lower grades. Producers are receiving the same prices as before, and the following prices rule in the market: Water-white comb, 16 to 17; white, 15; water-white, extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 5½ to 5¾; candied, 5¼ to 5½.—*Pacific Rural Press*, Sept. 19.

**How to Get a**  
**Delicious Apple**  
**& Banner Grape**

telling about wonderful new fruit districts in Northwest, West and Southwest. Our editor personally visited these sections and tells honestly and vividly all about them. This number alone worth hundreds of dollars to the seeking new and profitable homelands. Write now to The Fruit-Grower, Saint Joseph, Mo.

**The Fruit-Grower, Box 907, St. Joseph, Mo.**  
Send paper 3 months FREE and tell how to get New Fruits without cost, after which I will accept offer or notify you to stop the paper.

Name \_\_\_\_\_  
Town \_\_\_\_\_ State \_\_\_\_\_

**LIVERPOOL.**—The honey market continues steady with a good demand for lower qualities. We quote: Chilean, 4½ to 6 cts.; Peruvian, 3½ to 4½; California, 8½ to 11; Jamaican, 4½ to 5; Haitian, 5 to 7. Beeswax continues firm—African, 29; American, 30 to 34; West Indies, 29 to 33; Chilean, 30 to 36; Peruvian, 34 to 35; Jamaican, 34 to 35. **TAYLOR & CO.,**  
Sept. 20. 7 Tithebarn St.

**The A. I. Root Co., Medina, O.**—Some say the locality is the prime requisite in bee-keeping; others say the hive; others, the man; but what about the smoker? It plays a mighty important part in modern bee-keeping. It is needed at every hive and at almost every movement.

Your Jumbo bass smoker is certainly the best I have used in twenty-seven years, and my help grab it first out of three makes; and as the price of a good smoker is soon gilded in time and comfort, send me at once two more. **R. L. HOLTERMANN.**

Brantford, Ont., Can., July 10, 1908.

### FARM LIBRARY FREE.

The *Farm Journal*, of Philadelphia, is now making a very attractive offer to all up-to-date farmers who are on the outlook for superior reading. It will give, for a limited time only, a five-year subscription to that valuable paper, and any one volume of Biggle's Handy Farm Library, for one dollar. Surely a five-year subscription to an excellent farm paper is worth more than a dollar; and, in addition, you will get an excellent bound book relating to some branch of farm life. This looks to us like an extra-good offer—in fact, one could hardly expect to get any thing more from one dollar.

But the *Farm Journal* people go further than that, and are prepared to offer the other nine volumes of their Farm Library on terms that are equally favorable. With very little work on your part you may earn a ten-volume farm library that you will be quite proud to own. There are none of the onerous restrictions attached to this offer; on the contrary, the offer is plain, simple, easily understood, and very easily carried out. Write to the *Farm Journal*, 1003 Race St., Philadelphia, Pa., and get all particulars.

### A USEFUL MACHINE.

One of the most useful inventions of the 19th century was the machine which cuts up green bone into pieces small enough for a hen to swallow without difficulty. This made it possible for the ordinary poultry-keeper to have artificial insects for his fowls any day in the year at a very small expense. For chickens, the green-cut bone is a perfect substitute for insects. The general effect is the same, and many practical egg-growers would hardly know what to do without such machines. The bone is cheaply and easily secured, and in all parts of the country. One of the pioneers in the manufacture of these machines is Mr. F. W. Mann, of Milford, Mass., whose fame in this connection is world-wide. He was early in the field, and his machines are practically perfect for the purpose intended. We believe Mr. Mann is quite liberal in the treatment of his patrons, and is prepared to stand behind any claims he may make in behalf of his machine—in fact, does business on the most up-to-date business principles. Thousands of his machines are in use all over the globe, and many of them have stood the test of years from our own personal observation. See advertisement on page 1215.

## Another Pennant for Indianapolis

*By the Bee Crank*

Greatness has been once more thrust upon Indianapolis—this time by her baseball team in competition with players from seven other large cities, from Minneapolis to Louisville, and Kansas City to Columbus, Ohio, comprising the American Base Ball Association.

As if the distinction of having the bee-supply house that holds the record for the most perfect and prompt delivery service was not enough!

Indianapolis has also broken the association record of attendance at any one ball game—more than 21,000 people witnessing the afternoon game of Labor Day, which shows what a hold good clean sport has on the affections of the American people.

I have not permitted baseball nor any other attraction to interfere with my specialty of prompt shipments. The following letter is not unlike

many others that I receive. Read what the other man says—note how it agrees with what I say:

LAWRENCEVILLE, ILL.  
WALTER S. POWDER,  
Indianapolis, Ind.

*Dear Sir:*—The bee-supplies that I ordered on the 29th reached me on the 2d. I am much pleased with the goods, and you surely do get them out promptly. You may count me as one of your customers as long as I am in need of supplies.

Yours very truly, JOHN DAVIS.

Root's goods at Root's prices, Pouder service included. You may order

from the Root catalog if you like, but you should have mine. Ask for it.

Upon all cash orders received during October I will allow a special discount of 6 per cent. It will pay you to anticipate your wants, even if you can not use the goods for several months. At that your money will earn good interest.

Send me your beeswax. I pay highest price, cash or trade, and make settlements as promptly as I make my shipments.

**Walter S. Pouder,**  
513-515 Massachusetts Avenue, Indianapolis, Ind.

### THE MEDINA SAVINGS DEPOSIT BANK.

This is one of the sound financial institutions of the Western Reserve of Ohio. With no great flourish of trumpets it has achieved great success, and now has depositors in all parts of the Union. This is rather out of the ordinary for a bank situated in a county town of no great importance; but the fact that it is in the center of a rich agricultural region gives it fine opportunity to loan its money on good farm security that is never likely to deteriorate in value. It does not have to go far to place its money in good investments, nor is there any speculation required. Such a condition practically eliminates losses, for its managers and directors are careful, prudent financiers who take no chances whatever, so that the secret of its success is very easily explained. If you have any money for safe keeping, with a fair interest added, perhaps it may be well to correspond with the Medina Savings Deposit Bank. They are nice people to deal with.

### THE LORE OF THE HONEY-BEE.

The above is a new book on the life and work of the bees. It is on the same general plan as Maurice Materlinck's masterpiece, "The Life of the Bee," but is far more accurate. The author, Mr. Ticker Edwards, is not only accurately informed on practical bee-keeping, but is well up on the science of the honey-bee. He is not so facile a writer as our modern Shakespeare (Materlinck) yet he is a gifted author, and writes with fluency, ease, and fine diction. THE LORE OF THE HONEY-BEE is one of those books the bee-keeper will buy to read through carefully during the long winter evenings when his pets are snugly asleep in the cellar. After he has read it though he will commence right over again, as it makes good reading for a bee-keeper. It contains a number of beautifully executed engravings, some of great interest. One is a fac-simile of Butler's "Bees Madrigal" copied from the edition of 1623, giving both words and music. The half-tone work is excellently well done, and the typography is in keeping with it.

Some of the ideas advanced by the author are calculated to cause the average bee-keeper to sit up and take notice. It is evident the bee has been well studied by the author, and that the striking features of bee life are familiar to him, but mean something different from what the ordinary bee-keeper believes to be the truth. This is all done in an easy, graceful manner that is sure to win many readers.

The work is dedicated to his friend, Mr. T. W. Cowan, chairman of the British Bee-keepers' Association. The publishers are Methuen & Co., of London, England. For price see advertisement elsewhere in this journal.

### MAKING THE HENS LAY WINTER EGGS.

It is now well known where the money is in the poultry business. It is not in producing eggs in summer when poultry-fruit is cheap, neither is it in producing early chickens. Where the expert shows his skill is in producing eggs when they are worth 50 or 60 cts. a dozen, which, of course, is around Christmas-time. There are no bugs, grasshoppers, grubs, and other insect food to be obtained then, so that, perforce, we must find a cheap substitute. There is not enough protein (albumen) in two bushels of corn to produce a dozen eggs. Fresh-cut raw bone will do the business for us. In fact, hens can be made to lay more eggs in winter than in summer. Mr. H. B. Humphrey, manufacturer of the Open-topper bone-cutter bearing his name, says he can do it and we believe it, judging from what others have said about green-cut bone. He cites an instance of a man owning 70 hens that averaged 40 to 50 eggs a day during December, January, and February, getting occasionally 55 eggs. Such a man is a successful poultryman.

If you desire more information relative to these helpful bone-cutters, write to the manufacturer, H. B. Humphrey, Joliet, Ill.

### SUBURBAN LIFE.

One of the handsomest magazines published in this or any other country is *Suburban Life*. Recently it has taken on a new lease of life, and in time will probably lead all other magazines of its kind, though it is, comparatively speaking, very young in years. Its publishers are among the most enterprising firms in America, who will not hesitate to spend money to make it the recognized leader in the field it occupies. These fancy country magazines are doing a great deal to make farming popular among the young people by showing them the beautiful homes other folks have in the country, and also how their own farm can be improved to any extent by the judicious expenditure of brains, time, and money. Many farmer boys will not believe farm life can be made so attractive until they see the splendid pictures which adorn the pages of *Suburban Life*. The girls are delighted to see the pictures of the interior furnishings of the country homes so long to others more fortunately situated in some respects. From these pictures young ladies gain ideas which would be difficult for them to obtain in any other manner. Thousands of readers have put these ideas into practical use, and many an American farm home is the happier and brighter for it. By proper attention to landscape gardening, 90 per cent of our farm-houses can be set off to great advantage. At present they look too plain and uninviting. Look at the question in this light, and you will decide that a subscription to *Suburban Life* is a cheap investment.

## ONLY FOUR AGRICULTURAL PAPERS ON THIS LIST.

(GLEANINGS IN BEE CULTURE ONE OF THE FOUR.)

(The Little Magazine with a Big Field.)

If more evidence were needed than we have already given on these pages the following letter should be conclusive. When a large concern like the Potato Implement Co., and a large agency such as the Long-Critchfield Corporation, select GLEANINGS for page advertisements they do so because they *know* it pays well.

## "Practice Makes Perfect."

A little girl sat on her father's lap, looking into the mirror, and inquired if God made both her father and herself. Being assured that he did she remarked that he was doing better work than he ever did before.

It is simply the old adage over again, and it is true of *The A. I. Root Co.'s* Bee-keeping Supplies; and while perfection can never be attained they are as near perfection as improved machinery and years of practice can well make them. If you have never seen them, or if you have, and have not a catalog, send at once for my 40-page catalog, illustrated profusely, and giving prices of every thing used in the apiary. *It is free for the asking.* Special price list of shipping-cases, and all kinds of honey-packages—wood, tin, and glass. Send a list of what you will need at any time and let us tell you what they will cost you delivered at your station.

*Cash or goods, for wax at all times.*

## "The Information I Got From The Farm Journal Helped Me To Make \$137.00 In Clear Cash"

Mrs. Ollie C. Krieder,  
Jamestown, Pa.

"I can make \$50.00 a year more with the help of the Farm Journal. Would gladly pay \$5.00 a year rather than do without it."—M. N. S., Haines (G.).

"The 'Farmers Problems' of the last few months have been worth more than the subscription price."—Hiram Entreckon, Ohio, Neb.

These are only a few of the thousands who take the trouble to tell us how they have profited through the Farm Journal.

No matter whether you live on a farm large or small—or whether you live in town and only keep a few bees, or a cow, or a horse, or care for a small garden, you will find the Farm Journal filled with timely suggestions for making your work more pleasant and profitable.

No other paper helps the farmer or villager with such valuable information and suggestions, based on facts and experience and not on theory, as does the Farm Journal.

The October issue will contain helpful articles on the following subjects, that will show our readers how to make more money.

Poultry, Pigeons, Hogs, Horses, Cows, Bees, Flowers and Vegetables. But these are only a few of the subjects handled in this October issue.

"High Farming at Elmwood" by Jacob Biggle—"How to Keep Well", "Some Troublesome Insects and How to Deal With Them", "Farm Problems and How to Solve Them", are a few more articles to be found in the October issue, any one of which is worth more than the price of a single copy.

Remember all this is in a single issue and each issue seems better than the last. Every article goes straight to the point, telling you what you should know.

The Farm Journal now has over 500,000 subscribers, the greatest circulation of any farm paper in the world.

We want subscriptions for 5 years. The price of a five-year subscription is NOW seventy-five cents. This offer is good until January 1, 1909, after which the price will be one dollar.

If you subscribe now we will date your subscription from Jan. 1, 1909 and you will receive the October, November and December issues FREE. For \$1.00 you can secure a five year subscription and any one volume of the Biggle Farm Library.

## You Need this Handy Farm Library

These eleven books, each an authority in its own line, are wonderful storehouses of advice, and information. Farming in any of its branches, with their aid is simplified. They are from the pen of Jacob Biggle, for the past 39 years a contributor to the Farm Journal. His long personal experience in farming, stock and poultry raising and fruit growing, supplemented with the best counsel and help of other specialists, has gone into these Books. They are like the Farm Journal itself, concise, practical, modern, comprehensive and handsome. PROFOUSELY ILLUSTRATED, several with fine colored plates.

**The Garden Book** tells how the author made money in the business—a remarkable record.

**The Orchard Book** is crowded with new fruit facts and fine illustrations. By an expert.

**The Berry Book** is a handbook of practical pointers by famous berry growers. Fine colored plates.

**The Horse Book** covers the subject thoroughly, health and diseases, history, training, care. \$5,000 copies sold.

**The Poultry Book** is tremendously popular—by far the best handbook for the farmer's or villager's flock. 6th edition.

**The Cow Book, Swine Book, Health Book, Pet Book and Sheep Book** are also condensed encyclopedias of information. Each Book is a handy size to slip into the pocket and consult during the day's work. They cost only 50c per volume, postpaid, \$5.00 for set of ten.

## Let Us Send You a Biggle Book on Approval

Don't send us any money. Just fill out the coupon in the lower right hand corner stating which book you want and we will send it with a sample copy of the Farm Journal for your approval. If after you have looked them over carefully you don't honestly feel that a five years' subscription to the Farm Journal and one of these Biggle books is the biggest value you ever saw for only one dollar, send the book right back and we will return the postage you have spent.

If you think it is a good offer, send us One Dollar, keep the book and we will enter your subscription for the Farm Journal for five years.

Don't lose by putting it off. Your horse may get the colic. Maybe your hens are not laying as many eggs as they should. Perhaps you are going to buy some fruit trees and unless you have some reliable information on how to plant and care for them, they will fail to thrive. Then, dear reader, you will wish you had the Farm Journal and the Biggle books which will help you solve these and many other problems. Fill out the coupon and send it in today and in addition to sending you your choice of the Biggle books on approval—we will tell you how

Pub. Farm Journal.

Please send me on approval your Biggle

Book

If satisfactory will send you \$1.00 for the book and a 5 years' subscription to the Farm Journal, otherwise I will return the book inside of 10 days.

YOU CAN SECURE THE OTHER 9  
BIGGLE BOOKS FREE!

NO. 19

## STRAY STRAWS

DR. C. C. MILLER

O. O. POPPLETON may be alone in using the Long-idea hive in this country, p. 1118, but he has plenty of company in Europe.

MR. R. BEUHE says that in California they have introduced the eucalypti that are rapid growers, but the slow growers are the best kind for honey.

W. K. M., p. 1117, says bees are better judges of sweets than we are, and we might as well cater to their prejudices. That's to the point. Now tell us what they have shown as to their prejudices.

SMALL PLOTS of grain give better yields than plots of several acres, and it is not easy to tell why, says A. I. Root, page 1144. Is it not just possible that plants, like folks, do better for having lots of air, and that the small plot has an advantage in this respect?

A. I. ROOT, do you ever have trouble breaking up sitting hens? Here's the way my brother-in-law does it: He brings the sitting hens up to our place, where they wander about the strange premises with no thought of sitting, and after a few days' visit they are taken back home, and are all right.

J. A. CRANE, referring to Straw, p. 799, says he removed queen from colony in the morning, found cells started about mid-afternoon, when he returned queen, putting all but one brood above excluder, as described page 757, and got six fine cells. Certainly that was small interference with the laying of the queen.

THAT PICTURE of the Ebrito apiary, p. 1130, makes me think I'd rather like something of the kind covered with Virginia creeper (*Ampelopsis quinquefolia*) or grapevine. For the north, with trellis running east and west, I suppose the north row of hives should be outside the trellis and the south rows somewhat toward the center. That would keep them more in the shade all day long than to have both rows square under the trellis.

MR. PRITCHARD's plan of selecting larvæ for queen-rearing, page 1119, seems admirable. Let me add that, for the every-day honey-producer, there can hardly be any thing better than to let the bees do their own selecting, giving them newly built comb filled with eggs and young brood. At any rate, that plan works best "in this locality," and I've tried pretty thoroughly the other plans, although I don't think I selected as wisely as Mr. Pritchard.

YOU'RE RIGHT, Mr. Editor, in thinking that the plan of putting paper between hives when uniting colonies, as given by Wm. Beuglas, p. 1139, will work. I have used it lots of times in ordinary uniting, and gave the plan in print years ago—in GLEANINGS, I think. Just put a sheet of newspaper between the two stories, and the bees will do the rest. [Since you speak of it, we recall that this method of uniting colonies has been before exploited in these columns.—ED.]

F. H. CYRENIUS, p. 1135, advocates Oslerizing the old bees in the fall. The same thing was exploited considerably in the bee journals years ago—by Hosmer, wasn't it?—but nothing came of it. It is just possible that there may be some advantage in having the larger bulk of bees in the first part of winter, even if they do consume honey only to die before spring. [We shall be glad to hear from others as to whether it pays to carry the old bees through the fall and early winter.—ED.]

A QUEEN is made to lay eggs in cells covering an area as large as one's hand in perhaps an hour, on page 1119. That area will probably contain 500 cells on one side. To fill it in an hour means 12,000 eggs in 24 hours. The best layer ought hardly to be asked to lay more than 5000 eggs in that time. Yes, I have my opinion of any man who goes around picking at little things like that; but I thought some one would be sure to do it, and I'd save him the trouble of making himself disagreeable.

THE ADVICE given to that bee sister about sweet clover, p. 1145, is good, only she should be told that if the ground is soft the plants will all be dead in spring. I once sowed several rods with oats at the usual time of sowing oats. There was a beautiful stand, but the next spring not a plant was alive—every one heaved out. The ground should be *very hard*. It might be all right in soft ground if the ground was covered. Replying to one of her questions, if growth is started in fall, plants will bloom the following season.

AS TO SUGAR, I wish the discussion might continue till we know absolutely how much or how little difference there is between cane and beet for feeding bees, and then further till we know just how we may be sure we are getting cane, if cane is the better. For years the *British Bee Journal* has held most emphatically that cane sugar is the proper thing to feed bees, and beet sugar unfit. Is it not likely that it has good ground for its position? The sugar-beet industry has become an enormous affair, and I suspect most of our granulated sugar is made from beets. I know

that large dealers advertise, "We do not handle beet sugar," but I wish they'd tell us how they know they don't. [The United States neither produces nor consumes much beet sugar. Michigan is the only eastern State which cuts any figure. California, Utah, Idaho, and Colorado are large producers, but it is consumed there. We import little or none. Possibly about one-seventh of our consumption is beet sugar. England consumes vast quantities of beet sugar, more than any other country by far.—W. K. M.]

YE EDITOR wants me to tell why the bees gnawed away the splints in the combs pictured on p. 1127. If the splints were boiled in wax and used at such temperature as to be well coated, and then given to the bees at a time when they were building comb, I don't know why they should make such bad work. E. F. Atwater's plan of spooning wax over the splints may work, but I believe I'd rather paste over each splint a small strip of foundation. In that case there would be no need to wax the splints. [Do you think there is any real difference between boiling the splints in the hot wax or covering them over with a thick film of wax as described by Mr. Atwater? We should like to hear from the latter as to whether he has tried boiling the splints; and if so, whether it prevented the bees from gnawing them. Possibly your strain of bees, doctor, are not as much inclined to do this thing as some other strain.—Ed.]

PARDON ME, friend A. I. Root, if I disagree with you when you object to having the stars and stripes floating over a brewery, page 1143. Why not, so long as the brewery is doing a legitimate business under the protection of that flag? On the whole, isn't it a good thing thus to proclaim that the United States government is especially interested in the brewery business? If we object to the proclamation of that fact, let's get rid of the fact. Come to think of it, we're steering pretty surely in that direction. One after another the States are going dry so rapidly that one can hardly keep track of them. See if you can tell offhand just how many. Well, there are 8—practically 9, for the election just held in Arkansas makes it morally certain that State-wide prohibition will be enacted at the meeting of legislature. Take good care of your health, Brother Root, so as to live until there shall no longer be a brewery or a brothel over which the American flag can wave.

## EDITORIAL

By E. R. ROOT.

### DEATH OF E. W. ALEXANDER.

IN our issue for Aug. 15 we announced that our correspondent, Mr. E. W. Alexander, of Delanson, N. Y., so well and favorably known to our readers, had an incurable disease, and that it was only a question of days when death would relieve his sufferings. We are now pained to announce that our friend passed away on Sept. 19. He had specially requested, before he died, that Dr. D. Everett Lyon, of Rye, N. Y., another of our correspondents, should preach his funeral

sermon. Dr. Lyon knew Mr. Alexander very intimately, and has promised to furnish an obituary sketch, telling something about this large-hearted Christian man.

### SENDING THE SAME MATERIAL TO TWO BEE JOURNALS.

WE wish to protest most earnestly against the practice of some of our correspondents in sending precisely the same photos to two different publications at the same time. Perhaps the thought is that, if one of the papers does not accept, the other will. But a photo designed for publication should be regarded as so much original matter for one journal. Manuscript should likewise be given to only one publisher; and then, if he declines, the owner is at liberty to send it to some other publisher. If one publisher buys manuscript or photos in good faith he should have the exclusive use of them, and the seller has no moral right to accept money for them from some other publisher.

### QUARANTINE ON QUEENS TO HONOLULU.

HAVING heard that a quarantine has been placed on American queens to the Hawaiian Islands, we wrote Dr. E. F. Phillips, of the Bureau of Entomology, who has recently returned from the islands. We give his letter herewith.

*Dear Mr. Root:*—Among the numerous letters which I am attempting to clear up I find a letter from Mr. Gates to you under date of July 25, concerning the quarantine regulations at Honolulu. By this time you have probably heard from Mr. D. L. Van Dine concerning this matter, since he wrote me that you had requested information from him on the subject.

No satisfactory quarantine is yet in force, but there will probably be a good bee-disease law passed this winter. At present all queens introduced are reported to Mr. Van Dine, and he follows them up to see if any disease breaks out. While I was over there I was asked to make recommendations for a satisfactory disease law, and a quarantine was one of those recommendations. Careless queen importation should not be allowed in a country as free from disease as Hawaii is. Then, too, most imported queens are sent to small bee-keepers, who naturally are not competent to diagnose disease. The big men have satisfactory stock, or if they do import they would take care of what they got.

Washington, D. C., Sept. 19.

E. F. PHILLIPS,  
In Charge of Apiculture.

We have written Mr. Van Dine, but as yet have not heard from him. In view of the circumstances it might be best for breeders of queens to Hawaii to wait until something more definite is learned.

### THE BIG NATIONAL CONVENTION AT DETROIT, OCT. 13 TO 15.

THE convention of the National Bee-keepers' Association, that is to be held in Detroit, in the pavilion of the Wayne Hotel, Oct. 13 to 15, promises to be one of the biggest and most enthusiastic meetings of bee-keepers ever held in the history of the Association. We have had reports from bee-keepers all over the country who expect to be present. The editors of this journal intend to be on hand.

Detroit has always been an ideal convention city, as it is right in the heart of the best bee country, taking in Canada and some of the best sections of the United States. Rates by water are always very low, and hence it is possible for bee-keepers to get to this convention at a low rate, and comfortably. Then, moreover, Detroit has connections by trolley in every direction.

The program is given elsewhere under head of Convention Notices (see page 1225). It will be observed that there are some new and attractive features. Secretary Hutchinson has spent a great amount of time in working it up. Every thing at the present time goes to show that this will be a great convention—something that no bee-keeper within two or three hundred miles of Detroit can afford to miss.

The convention itself is to be held in the Sun Palace just back of the Wayne Hotel, and on the water's edge, away from street noises and dust. It has very often happened that our National conventions have been held in halls where it was difficult to hear the speaker, owing to the traffic on the streets below. But this year we shall have every thing quiet by ourselves.

The rates at the Wayne Hotel are \$2.50 a day, two bee-keepers in a room, provided 150 register there. There are other hotels near by, with rates ranging from \$1.25 to \$2.00 a day.

Remember the date, Oct. 13 to 15, at Detroit.

WHEN HONEY IS QUOTED ON THE MARKET, OR IS SOLD AT A DEFINITE FIGURE, DOES THAT FIGURE INCLUDE THE WEIGHT OF THE SHIPPING-CASE AT THE PRICE PER POUND?

A SMALL producer inquires, when he sells a case of sections at, say, 15 cents a pound, whether that price includes the shipping-case. In reply we would say no—at least that is the rule here. Again he asks, "If a case weighs 24 pounds does that mean the 24 sections alone weigh that, or that the case, sections, and all represent that weight?" It is a universal rule that the case is not included. Where there are very large shipments, a few representative cases may be weighed up, and an average struck of the weight of a single case. The whole shipment is then weighed, when the tariff per case, as shown by the aforesaid average, is eliminated. In some instances, where the parties are very particular, every case is weighed, and the sum of the total weights of the empty cases is extracted from the total gross weight. As a general thing, the buyer will find net weight and tare showing in two separate sets of figures on the case. If the producer is one in whom he has confidence he will be likely to accept the net weights, and render payment accordingly. If, on the other hand, the producer is a new man he will weigh up each case and its contents separately. If he finds that the net weight and the tare agree with the figures on the shipping-cases taken at random, he will likely accept the figures throughout.

In the Colorado quotations it is the rule to quote honey by the case, say \$3.00 or \$3.50, depending on the market. Each case is supposed to hold approximately a certain weight of honey—that is, all the cases in the shipment must average up such weight. But it is understood that the weight of the case is not included in the figures on the case of honey. See Colorado grading-rules on our honey-market page.

It very often happens, after the honey has been through a freight shipment, there are some breakages and leakages. The honey soaks into the wood and makes the case weigh a little more than when it starts. This must all be taken into consideration when accepting the net weight and tare of the producer.

#### HONEY MARKET AND PRICES; THE FOLLY OF SELLING TOO LATE.

WE made a special effort, as our readers will see by consulting the Honey Column in this issue, to get complete reports from all the big markets in the United States. They should receive the careful analysis of every producer, not only that he may determine *where* he can do best with his honey, but that he may also seek to *prevent* some conditions that have contributed to a weak market in some sections of the country.

We observe that Boston and San Francisco are offering the highest prices. It will be remembered that the crop was a failure in Maine, and light in many portions of the New England States. This will account for the Boston market being up. Similarly at San Francisco prices rule strong because the main honey-producing portions of California gave a light yield.

The market seems to be weakest in the Central Northern States. Two or three of the honey firms account for this on the ground that a good deal of Western honey was shipped in last winter at just about the close of the selling season. About this time the panic came on, and this honey was left in the hands of the dealers. It began to candy, and sales, of course, began to drag. A large portion of it was left at the time the new crop of Eastern clover came on in July and August; and much is still in those markets. This, together with a very heavy crop of white honey, was a strong factor in weakening the market in the Northern Central States. One dealer at Cincinnati reports a marked decrease in demand, while the other speaks of an improvement at that point. Cincinnati is a great market. It has low freights on account of transportation by water, and in our judgment Southern honey, which seems to gravitate easily to the Queen City, has a tendency to affect prices on white honey.

But Pittsburg seems to be an exception. Not being able to get any definite reports we sent our honey-man to look up the situation. He furnishes a statement for the Pittsburg market, signed J. A. W. Pittsburg is in the center of a large number of middle-class people—artisans and laborers. It is these people who consume honey more largely than those who are able to buy more expensive delicacies.

Another interesting feature is that the St. Louis market is weak while that of Kansas City seems quite brisk. Conditions around St. Louis are practically the same as those that apply to Cincinnati. The Philadelphia and New York markets, especially the former, seem to be fairly good. The former reports that the actual crop of honey secured was not as large as that indicated by the first reports.

Compared with last season, the Colorado market is a little weak, owing, no doubt, to the large crop of Eastern honey. This would make a shipment of alfalfa honey eastward unprofitable, even if Colorado had good crops, which it did not have. But it is expected that the Colorado market will improve, after the fruit has been disposed of.

There is one important fact on which we wish to place special emphasis—namely, the folly of making large shipments of honey to any market after the holidays, or, rather we should say, of

selling too late. There is no reason in the world why honey could not be sold in October, November, and early in December. A year ago, for example, all the markets of the East were bare of comb honey. Dealers could not get it for love nor money, in spite of repeated calls for it; but along about the holidays some of the Western producers began to send in their cars of honey, and by the time they reached the East the panic came on, and prices went to the bad. There can be no question but that those late shipments of Western honey last winter are largely responsible for the weakened market in the Central Northern States, where most of this honey was dumped. It was so cold that some of it candied on the way, and then, too, it was too cold for the dealer to ship again, even if there had been a demand for it. While the producers possibly got their money, the majority of them this year will have to take a cent or two less per pound for their honey and for their folly. If they had shipped this honey a month earlier, when they could have done it, and when there was a strong demand for it, it would have sold almost instantly, and the result would have been a clean market ready for fresh goods.

Except, perhaps, in the Central States we should say that the market was stable. Producers would do well not to hold their honey too long. We would especially urge this this year, that the honey be sold around home to grocers and consumers direct. Better peddle some of it, bottle it—do any thing rather than to send to a weak market and make it weaker.

#### TIMELY HINTS ON FALL UNITING.

A SUBSCRIBER wishes us to give full particulars of how to unite weak colonies at this time of the year. As we have had other inquiries of like nature we will take a little space to cover the ground.

If we put two separate lots of bees together that were located on stands remote from each other in the same yard, there will be more or less of returning bees to the old stand. These will be practically the old ones. As they will die along about midwinter, their loss may not be considered very great. But some, and perhaps all, of these old bees may be made to stay in their new quarters. If they be put back a couple of times, the great majority of them will stay put; but this involves considerable labor.

In view of the fact that bees will go back to their old stands, Mr. Doolittle has advised uniting in the brood form early in September. This will leave the hive or the stand to be vacated in late fall with a few old bees. These may be allowed to die, for it may be said they will not be worth much to the strength of the colony.

A very good way to unite, and avoid all loss of returning, is to do so at the very time of putting them in the cellar. For example, A and B are both too weak to winter outdoors. We will place the two together in one hive, making a brood-nest out of the best combs selected from the two hives, leaving the other combs for reserve feeding in the spring. As soon as the two families are placed in one hive they should be put in the cellar immediately, and left there till spring.

Another way to unite without bees returning is to take two weak colonies, one from one out-yard and the other from another, and put them

together at either one of the outyards, or at the home yard. There will be, of course, no returning; for when bees are taken away from their usual environments for, say, a radius of a mile flight, they will stay where they are put.

But suppose there is no outyard, and it is desired that there be no returning. One may shake into an empty box, or, better, a box having wire-cloth sides, bees from, say, three or four nuclei, and then put the box down cellar. The more different lots of bees one can get in the mix-up, the better. After they have been down cellar for 24 hours, they may be put anywhere on a permanent stand, and there will be very few of them that will go back. But this again involves considerable work.

Thus far we have said nothing about the queens and the possible fighting on the part of the united bees. As to the queens, if the apiarist is not particular the bees will take care of that, leaving but one queen. We said the *bees*; for we do not know whether the bees do the eliminating or the queens fight it out, leaving the victor the mother of the colony. But certain it is, nature seems to take care of it if the apiarist does not take a hand in it.

But suppose there is a choice of queens (and there usually is). He will then kill the least desirable one and introduce the other in an introducing-cage. It may not be necessary to cage; but as a matter of precaution we would advise it.

The queen problem will be nicely taken care of if one of the lots of bees is queenless and the other has a queen. In that case, put the separate sets of combs with the bees together; and if there be no fighting, the queen will be accepted. Another good plan is to put one family up stairs and the other below. But do not mingle the combs at the time of uniting.

But how about the bees fighting when put together? This depends much on the season of the year, the strain of bees, or whether they are well supplied with stores. With ordinary gentle Italians there will be little or no fighting in uniting. But if both strains be hybrids, Cyprians, or other cross strains, there will probably be some trouble; in such cases, feed before uniting. We had two lots of bees united that were entirely annihilated by one fighting the other. It is then always advisable to use smoke. If the two families to be united are separated by a wire-cloth screen for a day or two, there will probably be no battle; but when the bees get to stinging each other to death, the only thing to do is to use smoke, sometimes putting a little tobacco in the smoker.

If the uniting be deferred until quite cool weather there is much less trouble from fighting than if the process takes place early in September.

Where one is running for queen-rearing, and he has reached the close of the season with a lot of weak colonies, it is well to anticipate the work of uniting by putting the hives in pairs. All that is necessary then is to take away one of the hives; and after that, put both lots of bees in one. The hive that contains the two united forces is placed about half way between where the hives formerly stood. This will then catch the flying bees of both hives. If the hives be placed in groups of three, the three families are all placed in the center hive when the other two are removed entirely.

# GLEANINGS FROM THE PACIFIC COAST

By PROF. A. J. COOK.

## POULTRY AND BEES.

There are few inquiries that come to the experienced bee-keeper more frequently than this: "What other occupation can one combine profitably with that of bee-keeping?" While the concentration of effort is wise in all our plans, work, and efforts, and while the specialist is most likely to make a shining success of his work, yet in case of bee-keeping, with its numerous off-years, it is wise to find some supplemental pursuit that will enable one to keep the pocketbook occupied in these same off-years. Is not poultry culture the one best suited to this need of all our rural pursuits? If one has a special leaning toward fruit-growing, then that may well be considered; but poultry culture is interesting, profitable, and there is always sure to be a demand for the product of the chicken-fancier. The same habits of punctuality, alertness, push, that make the successful bee-keeper are just what are demanded to win success in the care and management of poultry. I have been successful with both bees and poultry, and I am persuaded that no other line of work will prove better suited to the average bee-keeper than the care of poultry.

## AN UP-TO-DATE POULTRY-BOOK.

The above is suggested by the fresh reading of Brigham's Progressive Poultry Culture, which is just from the press. It is published by the Torch Press, Cedar Rapids, Iowa. It is octavo, 293 pages, and thoroughly illustrated. The price is \$1.50. The writer is not only an expert with poultry, but has a thorough college education, and so has breadth of view, and is doubly well prepared to give his readers the very best that is known regarding this interesting pursuit. He shows his wisdom by suggesting that a thorough college education is desirable in any walk of life, and so the one who is to breed and rear fowls will succeed better if he is thoroughly versed in the several lines of study required in our best colleges.

I am sure that Mr. Brigham is correct in this position. Were I a ditcher I should wish the best education, as that would enable me to dig better ditches; but, more, I should see more in the digging than the ditch. I believe that the great advance just before us is the more general education of the masses. This will tend toward equality; and the more that people are alike in opportunity and ability, the more of fellowship and happiness will be secured.

This volume is by a thorough scientist, and so all the instruction and suggestion is scientific. The author, as a teacher in one of the leading agricultural colleges, is the better prepared to treat the several questions in a scientific manner.

Such questions as care, management, houses, runs, diseases, vermin, food, and breeds are thoroughly and plainly discussed. The author has no pet breed to thrust before his readers, but gives the merits of the several breeds, and leaves the reader to decide which it shall be. There are

good illustrations of the several leading breeds, with the merits of each judiciously portrayed. No experienced fancier can read what is said about rump without feeling that he is receiving advice from a real authority. What pleases me very much is the admirable index, as one is able to find at once just what he may need in any emergency. I am sure that any one who wishes to add to his pursuit of bee-keeping that of chicken-raising, or any one who wishes the latest and best in breeding and caring for fowls, will make no mistake in securing and studying this latest book on the subject.

## ROOM AT THE TOP.

I heard a good amendment to the above the other day. There is always room at the top, and the elevator is now running. It is absolutely true that there is always good picking at the top. The crying need of our time is for men of thorough preparation—men who can do things. To be able to do a thing a little better than any one else gives one wonderful independence; but to acquire this proud position requires the hardest of effort. I know a young man who was without means fifteen years ago, when I came here. He is now worth near or quite half a million. The whole secret of the matter is, that he has spared no effort to do the very best. He had a great responsibility placed upon him, and he shouldered it and worked so diligently and thoughtfully that every move was in the line of success. He soon was indispensable; and lest the great corporation that employed him might lose his invaluable care and service he was given a large share of the business on condition that he would stick by for a series of years. He has push, acumen, and integrity. No wonder he has pushed rapidly to the top. That is a trio that will land any one possessing them at the very front. We have many students who are paying their own way entirely in the college. Some of these have done more than pay all their expenses, and yet have led in their classes. It requires no very great foresight to see where these young people will bring up. I wish to add that, in more than one case, these parties are ladies. Does it not make one proud of his kind and country to know that a girl all unaided will reach a first place in college, graduating in the lead of her class, and that our great country makes such achievement possible?

## PEAR-BLIGHT, ONCE MORE.

Our readers will remember that pear-blight a few years ago broke out in the orchards of Central and Northern California, and worked havoc. It will also be remembered that serious complaint was made regarding the bees and the part they were taking in this mischief. GLEANINGS urged rightly, that, while bees did aid in spreading this dread disease, they were in no wise necessary to the dispersion, and that without bees the havoc would be as great. The disease ran riot, and the bees remained undisturbed. I am glad to report that the malady is much less this year than on previous years. The one remedy that has been applied with more or less thoroughness is severe pruning of all blighted branches, cutting well back from the wilt, and making free use of germicides as the cutting was being done. The

lessening of the disease this year can not be wholly explained by the application of these remedial measures, but it would seem that either the plague had run its course or else some enemy had seized hold of the blight-germs and was destroying them. Let us hope that this last is the case, and wish all success to the blight-killer. Loquats a few years ago were killed about here by something very much like pear-blight, but now are sound, vigorous, and healthy. It will not be the first time that blights have seemed to die out without any action on the part of man to destroy them.

## NOTES FROM CANADA

By R. F. HOLTERMANN.

### SECTIONAL CASES FOR WINTER AND SPRING.

At the fruit, flower, and honey show in Toronto, last winter, Mr. H. G. Sibbald, of Claude, Ontario, one of the six appointed as foul-brood inspectors, exhibited a sectional cold-weather case which, in my estimation, has a very decided advantage over any hitherto used. Especially is this sectional feature a gain in spring management.

A number of successful bee-keepers of Ontario are using with marked success a case holding four colonies, two placed side by side, and the pairs with backs together. The packing is underneath, at the sides of the group and over the top. This case, I believe, was first designed by Mr. Jacob Alpaugh, Eden, Ont., one of Canada's closest bee investigators. Mr. Sibbald states, "The advantage over single cases for packing is the economy of heat and expense. One case holds four hives, and costs less than half as much as four single cases; and four colonies packed together create and retain the heat and comfort not enjoyed in an individual case." The illustration shows one of the cases, the sectional feature of which is the invention of Mr. Sibbald. The lower section, A, holds the four hives *a, a, a, a*, having the usual packing underneath and above them. The wall and packing of this section is high enough to be on a level with the top of the brood-chamber of the four hives. The top section, B, consists of not only the cover, C, but the remainder of the side of the case, D, and the packing, *e*, which is held in the cover by means of a piece of cotton or burlap, *f*, stretched across the bottom. Between this cloth and the roof the packing lies.

To examine colonies in early spring as to stores, etc., it is necessary only to remove the cover, or upper section, to expose the group of four hives. The cover, the packing above the level of the hive, and the side wall of the outer case, are all taken away at one operation. This convenience will appeal to those who have had to deal with the examination of colonies packed in outer cases. It saves an immense amount of time, and it pre-

vents the packing from dropping into the hive and getting into the way of the operator. Mr. Sibbald says that the use of this case reduces the time for the fall and spring work to a minimum.

### THE ASPINWALL ENTRANCE.

At one of the Brant district conventions Mr. L. A. Aspinwall, who has wintered his bees and brought them through the spring with such uniform success, described a device he has for an entrance which is unique, and its features should appeal to the practical bee-keeper during winter and spring. It will be seen in the drawing that the outer entrance is not on a level with the entrance of the inner hive. The object of this is to break the wind and to prevent the rays of light from inciting the bees to fly at a time when they should not. During the last two winters Mr. Aspinwall has had the inside entrance two inches wide. Like Mr. Alpaugh he wants no alighting-board as a part of the bottom-board during the time when the entrance may become clogged with dead bees. The bottom-board, therefore, does not project beyond the front of the hive. The object of this is to reduce the entrance to a

SIBBALD'S WINTER CASE HOLDING FOUR COVERS.

minimum, diminishing the amount of heat the bees have to generate during cold and windy weather, thus saving honey and the vitality of the bee, and yet preventing the entrance from becoming clogged.

By means of this device, the bees dying and making for the entrance by their own efforts, or bees dead and dragged forward by their living sisters, drop down into the "filth-box," as indicated by the arrow, as soon as outside of the hive. In Mr. Aspinwall's device the runway from the inner to the outer entrance is half the width of the 2½-inch entrance to the hive. Up this the

bees must go to get to the outside. The other half of the entrance is to allow the dead bees to fall down into the filth-box as they are dragged to the front of the hive. The entrance being so well protected, the bees have no difficulty in reaching the front of the hive.

THE ASPINWALL NON-CLOGGING WINTER ENTRANCE.

Over the outer entrance is a slide which may be opened or shut according to weather. During unfavorable weather the opening may be left only  $\frac{1}{2} \times \frac{1}{2}$  inch. It appears to me that Mr. Aspinwall justly claims that this plan secures an unclogged entrance, yet reduces the opening to a minimum. With the ordinary entrance more space is allowed to prevent clogging.

#### THE NATIONAL EXHIBITION, TORONTO.

The National Exhibition at Toronto, in its aparian department, presents no very special features this year. Mr. D. Anguish has a very fine display of comb honey, put up in a style a little different from the ordinary. Messrs. Grainger, Arthur, and Geo. Laing also have fine exhibits, making an attractive exhibit of honey at Toronto, and well representing Ontario honey. Prizes are fairly well divided. Mrs. D. Anguish also shows comb honey.

#### THE NATIONAL CONVENTION AT DETROIT.

If present interest among Canadian bee-keepers is any guide, there will be the largest turnout of Canadian bee-keepers at the Detroit meeting that has ever been at a convention in the United States. Secretary Hutchinson has worked hard to make a success of the meeting, and Pres. G. E. Hilton will make a good presiding officer. The writer is looking forward to being at the convention.

#### WINTER STORES.

This is the time when winter stores should be well looked after. Mere weight of hive is not altogether satisfactory. The wood may be unusually heavy, although as a rule this is somewhat uniform. Then the stock may have been queenless for an abnormal length of time, and the combs may contain a lot of bee-bread or pollen. This weighs even more than honey. Again, the combs may be old. Sometimes the colonies that have had the best queens keep the brood-chamber well filled with brood to the exclusion of the storage of honey, and starve, owing to the carelessness of the bee-keeper. This is not a

proper selection. It is, in fact, the extermination of the fittest instead of the survival. Let us see that we are not guilty of this folly. Again, the weather has been favorable to the secretion of honey-dew, as it has been dry and the nights cool. Bees have been working early mornings on the oak. I intend to provide every colony with not less than 15 to 20 lbs. of sugar syrup for stores.

## CONVERSATIONS WITH DOOLITTLE

### FINISHING UP THE SEASON; WHAT TO DO WITH UNFINISHED SECTIONS.

"Smith wants to know if Doolittle will be offended if he asks him to be a little more explicit about finishing up the season than he was in that conversation given in GLEANINGS a few numbers back."

"Oh, no! Was there any thing you did not understand?"

"I got somewhat mixed on some of the matter, and there were some things which I wanted to know about that you did not touch upon at all, and one or two items that were not applicable to my locality."

"Perhaps I did not take into account, as much as I ought, that different localities require different management, and that different seasons require different methods to meet the varied conditions as they come to the apiarist year by year."

"I think these things are not taken into consideration by the voluminous writers as much as they should be. In other words, it seems to be hard work for such writers as Doolittle, Dr. Miller, and others to get much beyond a circuit of about 100 miles from their own apiaries."

"Thank you. But are you sure that you would do better if you tried to write up my locality, knowing, as I do, that you are living more than 1000 miles away?"

"Perhaps not. But let us try again. Supposing—"

"Yes, supposing, then, that the season is nearing its close, and that each hive has an average of two supers of sections. This means, of course, that some have only one, others may have three or four, while two will be that of the majority, the sections being in all stages of completion."

"Now you are talking something as you should. I want to know just how I can get all these completed, and in the most economical way, as I desire to accomplish such completion as far as possible."

"There is quite an uncertainty along this line, as climatic conditions—cold, wind, clouds, and sunshine—have very much to do with these things. Then very much must depend upon the skill, judgment, and experience of the bee-keeper. I consider it good management to give the bees as nearly as possible the amount of room in the most available shape that they need at all times in which to store honey day by day as it comes in."

"But would it not be better to crowd them at this time of the year, so that they would finish up those sections commenced in, quicker than otherwise would be done?"

"No amount of crowding of the super room will induce the bees to seal over the combs before the honey is ripened to their liking. The raw nectar must be evaporated, or dried out, if you please—ripened and graded, so to speak, in that wonderful manner in which the bees know how to take the nectar product of to-day and make the finished product of to-morrow or next day."

"What do you mean by *graded*? You do not think that each bee-load of raw nectar is graded in accordance with the flowers such loads come from?"

"No, not that. As it is evaporated it is graded in accordance with its thickness or richness, inspected by a company of experts, and sealed up when it arrives at perfection, at the close of the honey-flow, when the wax secretion stops, with quite a few cells of unsealed honey in the last sections worked on."

"But why not feed the bees extracted honey to finish up such sections which are left unfinished?"

"Such unfinished sections have been a great temptation for various experiments by way of what has been called 'feeding back' during the past; but I must say, and that from considerable experience, that such feeding of extracted honey will most likely be unsatisfactory."

"I am sorry to hear that, for I had thought this might be made to pay."

"Some claim it will pay; but the reports that come to me from the rank and file, as well as my own experiments, convince me that the majority of those who have tried it pronounce the same unsatisfactory when every thing is taken into consideration."

"How do you remove the supers at the end of the season?"

"By the use of bee-escapes."

"Do these work as well at this time of the year as they do in midsummer?"

"If it is cold at the time of putting them on, and it continues cold, the bees will sometimes fail to go out of the supers till it becomes warm again; but as a rule I have no trouble along this line."

"How about robbers in taking off honey with the escapes?"

"There is no trouble whatever from this source if there is no crack about the supers large enough to admit a bee. In fact, the overcoming of the robbing tendency at this time of the year is one of the *great big* items which come to the apiarists of the world through the invention of the perfected bee-escape."

"What is to be done with these unfinished sections when taken from the hives?"

"As soon after taking it from the hives as possible the honey should be graded; and the unfinished sections that are not marketable should be extracted, cleaned by the bees, and stored where they can be protected until the next season, when they can be profitably used again as bait-combs."

"Would it not be more profitable to allow the bees to carry the honey out of the sections, or rob them, as it is termed, and thus save the labor of extracting them?"

"I hardly think so. The extracted honey more than pays for the work; and unless the robbing work is done very slowly by the bees they are apt to tear the combs quite badly."

"But does not the extracting break the comb,

which is always tender and brittle at this time of the year?"

"Not if properly done."

"Tell me how to extract properly."

"Several wide frames should be provided, into which the unfinished sections are placed as we come across them in grading the honey. As these are filled they are set on shelves near the top of the room in which we work, and where we can have a fire when needed. When we have a lot ready, or are through with all of our grading for the season, a fire is built and allowed to burn long enough to keep the top of the room at from 85 to 95 degrees for four or five hours, at the end of which we can extract the honey from those sections as easily and as safely as though it were midsummer with the mercury at the same height."

"If I remember rightly I have read in some of your writings that, where sections are two-thirds or more finished, or the honey that much capped over, you ship them to market."

"Yes, to the *New York* market."

"Where such are shipped, do you not have to send them off as soon as possible after they are off the hive?"

"I do not. Why should any one do so?"

"Because such unsealed honey, with me, becomes thin, and drips from the cells when handling if I do not get it ready for market as soon as off the hives. This is a very undesirable condition of things, as I have experienced to my sorrow."

"This is because the room in which you store your honey is cold or damp, or both. Where do you store your honey?"

"In a room over the cellar on the north side of the house. I supposed it should be kept in a cool place."

"This is like the old idea of our fathers, who thought there was no place suitable for storing honey except in the cellar. The very best of sealed honey will become thin and watery after a while if left in such a room as you are using. A warm dry room is the only suitable place in which to store honey; for if the room is such that the temperature will stay day and night at from 80 to 95 degrees, all honey in unsealed cells will become so ripe and thick that at the end of two or three weeks the sections can be handled as you please without one single drop stirring in any cell."

## GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

### BEE-KEEPING IN BRITISH GUIANA.

Away down near the equator, at Onderneeming, there is a reform school for boys where bee-keeping is taught. Last year they had 11 hives in working order, from which the crop was 1140 lbs. This was sold for \$177. The man in charge of that school deserves a gold medal, for I am safe in saying no reform school in all America can come anywhere near his record. Incidentally it shows what can be done in tropical countries when bee-keeping is properly prosecuted.

## ANOTHER BUBBLE BURST.

That famous bee journal, *L'Apiculteur*, of Paris, did not fail to notice the editorial in GLEANINGS, giving the editor's experience with Caucasians. It seems to have furnished our French contemporary with a good deal of satisfaction if not downright amusement. At any rate it closes its article with the remark, "Well! another soap-bubble burst."

## THE PURITY OF FOUNDATION.

The Abbe Pincot, a well-known contributor to French bee-journals, has lately given way to rather violent attacks on the purity of American comb foundation. His comments may be justly termed "fierce." Mr. Dadant champions the American side of the case. To put it mildly, the Abbe Pincot is "talking through his hat." His idea, apparently, is to boom the Rietsche press, but his way of doing it is unfortunate.

## PLURALITY OF QUEENS.

The visit of M. Sevalle (secretary of the French Bee-keepers' Association) to England has resulted in a discussion as to the feasibility of retaining more than one queen in a hive. M. Sevalle got inoculated with the plurality germ while in London at the Franco-British conference of bee-keepers. The contagion caught on in France, and no doubt the arguments will wax hot within the next few months. Thus far the discussion has been fair and open-minded.

## EUROPEAN BEES FOR ANNAM.

At a meeting of the Central Society of Apiculture in Paris some one called attention to the fact that three hives of bees had been safely sent to Hue, the famous port of Annam (French Indo-China). They were 33 days on the journey, which is rather remarkable, because the voyage was on tropic seas all the way, and the bees were closely confined the whole time, and yet were in extra-good condition on arrival. It remains to be seen, however, whether European bees can compete with *Apis Indica* in so exclusively a tropic country as Annam. I imagine bees from Madagascar or Reunion would fare better.

## HONEY VINEGAR.

The bee-keepers of the West are under lasting obligations to the Arizona agricultural experiment stations for more information about the manufacture of honey vinegar. This is contained in their new bulletin, No. 57, dated June 20, at Tucson. These instructions form a supplement to a former bulletin known as "Timely Hint No. 48," which gave full instructions by the station chemist, Prof. A. E. Vinson, Ph. D. We believe this bulletin is still in print, and may be obtained from the station. Prof. Vinson shows that bee-keepers use up too much honey, as a rule, when they make vinegar. It is wasted in various ways. He also notes that honey makes excellent cider, and it is cider first and vinegar afterward. The ancient bee-keepers were well aware of this fact, and made light wines from honey. In the western country, vinegar is high-priced and inferior (it is made from acetic acid), and there ought to be opportunities

in this connection. In the West Indies vinegar is high-priced and inferior, and there are probably other places where this is true. By donating the information contained in these two bulletins the Arizona station has conferred a benefit on bee-keeping. Thanks.

## THE LUMBER COMBINE.

The Attorney-General of the United States has decided to oppose the chartering or organization of a gigantic combine financed at \$300,000,000, to control the lumber trade of the South. The idea of this combine arose out of the proposal for a great forest reserve in the South to be known as the Appalachian Forest Reserve. It was killed in the committee stage in the last Congress, on account of legal objections, but is very likely to be revived again in a new form. A government forest reserve would be different from a lumber combine. In the former the bee-keepers would stand a chance; in the latter, none at all. It would be the greatest bee-preserve in the world.

## SUNFLOWERS IN OHIO.

A goodly number of the farmers in this section have small patches of sunflowers in connection with their corn. Probably in all cases it is planted for the benefit of the poultry, for it is a splendid feed for that purpose. To a great extent it forms a substitute for meat when fed to chickens and turkeys, on account of its high protein content and oily character. The oil soon shows its value in the beautiful sheen of the poultry fed on it. When preparing birds for exhibition I used hemp seed to get a luster; but sunflower seed answers just as well, or perhaps better. It requires rich soil for successful culture; but the chicken-pen will furnish that. In combination with chickens and bees, sunflowers are very valuable, more particularly if alfalfa is also grown for hen feed, which is not often. Some doubt the value of sunflowers for honey; but the nectaries of the flowers are very prominent. I should like to keep bees near a few hundred acres of sunflowers properly cultivated on rich soil. It looks now as if more would be grown in the future.

## THE HONEY-PALM.

In the September number of *The Guide to Nature* there is an excellent account of how large trees are successfully moved in California, and in connection therewith are some excellent engravings to illustrate the text. These show two very bulky "wine-palms" being moved by special apparatus. These so-called "wine-palms" are simply our old friend the Chilean "honey-palm" of other days. Its scientific appellation is *Jubea spectabilis*. The trunks of these palms are thick-set, and some in their circumference resemble hogsheds or large barrels. When cut down, one of these trunks will produce as much as 100 gallons of "honey" or "molasses." I suppose that, if the juice is rightly handled, the product will be termed "honey;" on the other hand, if rather poorly prepared it is "molasses." The blossoms are said to be rich in nectar, which is very likely, as the bloom of all the other sugar-producing palms is valuable for bees. Ta-

ken as a whole, the honey-palm is a very valuable tree. Great numbers have been ruthlessly destroyed by the Chileans. Californians ought to prize this palm.

#### DEATH OF MONSIEUR GIARD.

*L'Apiculteur*, in its September number, announces the death, on the 8th of August, of M. Giard, President of the Central Society of Bee-keepers in France. Note what kind of men the French bee-keepers select for a leader. He was formerly professor of natural history and zoology in the faculty of sciences at Lille. Later, from 1882 to 1886, he represented Valenciennes in the Chamber of Deputies. Latterly he occupied a chair in the Paris Faculty of Sciences. He was also a member of the city council of Paris, and a prominent member of the French Association for the Advancement of Science. He was 62 years of age. Such a man adds weight to a society.

#### DR. WILEY HONORED.

Critics of our pure-food laws prophesied, when the glucose decision was rendered, that Dr. Wiley was "down and out." This does not seem to be the case, however, for he has just been appointed president of the first international congress for the repression of adulterations of alimentary and pharmaceutical products. The congress was called at Geneva, Switzerland, on September 8, the principal nations of the world participating in the event. The congress arose out of a suggestion made by Dr. Wiley to the government of France; and Switzerland, a neutral nation, was selected to call the congress together. Its purpose is to establish uniform standards for foods and drugs for the leading civilized nations. Uncivilized nations do not require food laws.

#### ANALYSIS OF MEAT EXTRACTS.

Bulletin No. 114 of the Bureau of Chemistry, United States Department of Agriculture, resembles very much the honey bulletin gotten out by the same bureau some time ago. The subject-matter relates to "Meat extracts and similar preparations." The object of the investigation to which it relates was to discover just how valuable meat extracts are. There is a great variation in the analysis of the various brands, but it is clearly evident that their real value is very small. Good lean meat has about double the nutritive value of an average brand. This is contrary to the general impression. Most people "imagine" beef extract to be extremely rich in nourishment. According to this bulletin it isn't. Some of the best authorities cited state that the general effect of these extracts is poisonous; others say they are sometimes injurious, and some think they are beneficial as condiments. The general consensus of opinion among these eminent authorities is decidedly adverse. This ought to be known by all. If the American people understood the contents of this book, the sale of meat extracts would be small. It is necessarily very technical, but it shows the Bureau is doing good work.

## GENERAL CORRESPONDENCE

### THE HONEY RESOURCES OF MICHIGAN.

**What the Bee-keepers of the Lower Half of the State have to Depend on for Surplus Honey; the Influence of Weather Conditions on the Flow.**

BY E. D. TOWNSEND.

There appear to be two distinct soils in Michigan that are especially adapted to the wild red raspberry, the famous white-honey yielder of Northern Michigan. One is the southern two-thirds of Lower Michigan, which is now a rich farming country. It so happened that this part of the State was settled off and made into farms before much was known of the value of the wild red raspberry as a honey-producer, and the raspberry honey that was produced in the lower part of the State was mixed with and went for clover honey, many not knowing it from pure clover, when quite a portion of it might have been wild red raspberry.

This lower section of our State is now the old well-settled farming country, and, of course, the wild red raspberry is a thing of the past. When the country was new, and the farms were being cleared off, there were many waste places around stumps, etc., where the raspberry thrived; but this was before there was much of an awakening along the bee-keeping line, so I do not suppose there was any great amount of this honey secured.

One bee-keeper, however, Mr. Denis Gardner, was an exception to the general rule, for he was a little more in advance of his time than the rest of us. He was located with his bees in the southwest corner of Gratiot Co. This was about thirty years ago, when the county was new, and a few small farms were being cleared off. During a dry season all the adjacent woodland was burned over, and in three or four years there came up on this burned-over district a dense growth of the wild red raspberry. Mr. Gardner was there with his bees, and he reaped a fine harvest of honey. My bee-yard at the time was located some 15 miles south of Mr. Gardner's, in Clinton Co., where the fire did not burn hard enough to kill the timber. Then my yard was not established early enough (1876) to take advantage of this flow, even had I had the bees and experience to take advantage of it.

Mr. Gardner had both the experience and the bees. He produced the very finest comb honey, which came in with a rush during just the kind of flow for the best comb honey. I realize now, but could not grasp the idea then, that he had the knack of getting his bees through the winter and spring in good condition for this honey-flow, which came on early in June. He would have honey on the market at about the time my bees had but nicely commenced in the sections. The honey was of a pinkish color, but of a fine flavor; and knowing what I now do of willowherb I'm satisfied that it was of a mixture of clover, willowherb, and raspberry. This raspberry honey, the

production of the black rich soil, was of an amber color (although of good flavor), unlike the wild red raspberry further north, on the light sandy soil, where the nearly water-white red-raspberry honey of to-day is produced. The amber raspberry honey, when mixed with the white, gave a natural blend that was superb, both as to color and flavor.

Another man in the field about Mr. Gardner's time was Mr. Hiram Roop, of Carson City, Mich. Mr. Roop's bee-yard was located some 15 miles southwest of the Gardner bees, in Montcalm Co. This was before there was much known about out-yards, and Mr. Roop kept his bees all in one place until he had 150 to 175 colonies in his home yard. It was one of those early "bumper seasons" that he had the distinction of selling \$3000 worth of honey from this one yard, in one season—a record probably never beaten in the State.

At the present time this lower part of Michigan has three main sources of surplus honey—white and alsike clover, and basswood. While there is some buckwheat sown in this territory, I do not include it in the list as a surplus-honey producer, for on the rich soil of Southern Michigan it rarely produces any surplus; and when it does I think it would be when it is sown on a rather poor quality of sandy soil.

Basswood is the most unreliable of the three sources of white honey mentioned above. In the first place, the wood-lots on the farms are getting smaller each year, so that there are but few locations left in Southern Michigan where there is enough basswood timber left to support an apiary of 100 colonies of bees and produce a surplus, except in very favorable years. Our basswood yields only every second year, and but sparingly, even then. Fruit-trees bloom profusely nearly every year, but there is very much less fruit each alternate year. It would seem that the trees do so much one year that they need the next for recuperation.

Basswood is the same in this State; but, unlike fruit, it blossoms only every alternate year to the extent necessary to produce a surplus crop of honey. With bloom sufficient for surplus honey every second year, a crop of honey may be secured provided there is any basswood timber in reach of the bees, and providing weather conditions are favorable. I have seen a dashing rain-storm cut off the basswood flow when but half over. One of these washing showers seems not only to stop the honey-flow but to pound the delicate blossoms so that they turn black. The ideal time for flowers to secrete nectar is during a rainy season when no rain falls. This condition of the weather is not essential in all cases, for some of the best flows of honey I ever had from clover came when it rained nearly every day—when the bees had to do their work between showers. They made up lost time because the damp weather kept the clover in bloom for a longer period.

I am indebted to Mr. O. H. Townsend, Otsego, Mich., for the idea (which I have since verified) that, when a drouth comes during the middle of a clover-flow, and we are wishing for rain, this is the time of all times when we do not want rain, for this partially dried-up clover would be washed to such an extent as to stop the secretion

of honey for the year, or until a new crop of clover is grown. On the other hand, if there is no rain at this time the flow may last several days before it stops entirely.

White clover is more certain than basswood, as a honey-yielder, because it is not quite so sensitive to the weather conditions; and if there is a good stand of clover in the fall that is well protected in winter with a good covering of snow, we may, with fair weather, expect a honey-yield from white clover.

There is one clover that the Michigan bee-keeper can bank on, and that is alsike; and I think I can safely say that it is worth all the other sources of honey in the southern two-thirds of Lower Michigan put together. The bee-keepers in these southern counties are fortunate if they are in an alsike-clover location.

The ideal alsike location for a bee-yard is one where the clover is grown for the seed. In such a place the two red clovers are grown for seed also, especially the mammoth clover, which is a surplus-yielder some seasons. A soil most favorable for the production of clover seed is a very heavy clay, because the stalks do not grow so large, and more of the plant energy goes into the seed. On the rich loamy soil the tops are too large.

So far I have said but little in regard to the several minor sources of honey, such as the willow, elm, hard and soft maple, etc. These furnish honey and pollen during April, which is a great help to the bees in their breeding, since they are in bloom nearly or quite up to the fruit-bloom in May. The fruit-bloom in the fore part of May is the most important of all the natural spring stimulants; and if the weather is favorable, and the bees strong, one may expect them to put into the hive some honey in addition to what they need for their daily use. It so happens in late years that the weather is usually so unfavorable that the bees can not fly during this period; but, taking it all in all, this little honey the bees do get during the spring months helps wonderfully in stimulating the bees to breed up and get strong for the main honey-flow in June.

In some locations there are a few asters that may help to fill out the last end of the season; for in those locations where they yield, the flow lasts clear to the time of the frosts in September or the first of October.

In Sanilac Co. large quantities of this aster honey are secured some years; but with such food the bees nearly all die during the next winter, so it is a question whether the aster should be called a good honey-plant from the bee-keeper's standpoint.

Remus, Mich.

## WINTERING BEES IN A COLD AND DAMP CELLAR.

### A Properly Ventilated Bee-room in a Cold Cellar Made with Building-paper.

BY GEO. W. BABCOCK.

It may be as gratifying to some of your readers as it has been for me to be able to winter bees in an ordinary damp cold cellar under con-

ditions which are admirably adapted to the requirements for success.

Our cellar is much larger than required for my colonies, and since the temperature often remains but a few degrees above freezing for weeks at a time, I built, out of building-paper, a center room (in the center, by reason of its being less affected by the outside temperature), having only a framework to fasten the paper on—one thickness of good quality, red or brown building-paper being used, fastened by lath nailed around the edges of the paper, each strip of paper overlapping the adjoining strip, and thus making a practically air-tight room, care being taken not to puncture or tear the paper in putting it on.

Now, my method of getting the right temperature, and dry, warm, and pure air circulating within this paper room, during the entire winter, is the unique part, and is accomplished by an inlet and an outlet ventilating flue, one connected with the chimney in the house, the other with a room above the cellar. These air-passages I made of paper for the purpose of experiment, as large in diameter as the paper would allow. The inlet was long enough to reach from the floor of the bee-room nearly to the ceiling of the room above. The outlet was connected with the chimney, and it created the draft, causing the warm dry air in the top of the room above to pass downward through the inlet tube nearly to the floor of the bee-room in the cellar, displacing the cellar air which passed upward through the outlet tube to the chimney. The connections were as nearly air-tight as could be made by the lath cleating. The circulation would probably be stronger if the inlet-tube were left out and the air admitted to the bee-room direct through an opening in the floor of the room above; but such a plan would raise the temperature in the bee-room but two or three degrees, while with the tube extending nearly to the ceiling the proper temperature is obtained. The circulation was barely perceptible, yet adequate for the purpose.

There were three angles in the tubing, and, though constructed of cheap material, these were not made without some difficulty; but the cost covering the running expense is practically of no account. I could not observe that we burned a pound more coal, nor did the room seem in any wise affected by this connection with the cellar or chimney, and this was probably due to the few degrees of heat required to maintain the temperature of a bee-room in a cellar thus constructed; and as my increased number of colonies will fill this room half full this winter, I am expecting the animal heat to increase the temperature so as to require a damper or the admittance of cooler air to this room.

The outlet tube was placed in a partition, thus making no rupture in the appearance of the room above.

I close the entrance of my hives in winter with a strip of wire cloth after placing on the bottom of the hive two sheets of thin paper (the first sheet having a tack or two at the rear), and thus add to the purity of the air in this bee-room by removing the dead bees twice during the winter. When only the lower cleat, the one holding the wire cloth is removed, a paper can be withdrawn in nearly all instances without a bee escaping.

Clarkson, N. Y.

## BEE-KEEPING IN BRAZIL.

### The First Bee Congress in Rio Grande do Sul.

BY DR. A. L. GREGORY.

Five years ago, when Mr. Emil Schenk came to this State from Parana, there were very few men who used a movable-frame hive. Mr. Hahmemann was the most practical man in the state, but he had to give up the business on account of his age. He loves the bees yet, but he is too old and feeble to work with them. Mr. Schenk bought a stock of blacks and began business, continuing his experiments with both German and American systems, which he began in Parana. We have no supply factories here from which we can obtain what we want. We make all fixtures by hand, or order from abroad, which is very slow and expensive. Finally Mr. Schenk adopted a system of his own, fitted to the needs of the country, then mounted a mule, and for months at his own expense sold models to beekeepers and took subscriptions for a small bee-journal which he published. It was not a lucrative affair, so after many hardships he finally sold the paper to a company in Porto Alegre, the capital of the state, he remaining editor. This company in some way interested the governmental authorities in bee culture. As a result of this the government sent Mr. Schenk to Germany two years ago to import Italian bees. He returned late last year. By hard work some queens were raised, and a few distributed at government cost. This year there will be more sent out.

The "Centro Economico," which is under state direction, asked Mr. Schenk to write a treatise on bee culture. He composed it in German, and the authorities ordered it printed in German, Portuguese, and Italian. The Portuguese, which lies on my desk, has 54 pages and 32 illustrations. American bee-men, imagine your bee literature to consist of only one number of GLEANINGS! That is all we have in this state in Portuguese or Italian. The Germans lead in bee culture. Mr. Schenk is editor of the *Brasilianische Bienenpflege*, a monthly publication of 20 or 30 pages.

In September, 1907, was the first bee congress in our State. The outside attendance was mostly German, though the people of Taquary took a lively interest. Steps were taken toward organization; instructions were given as to hives, foundation, queen-rearing, etc. A society was formed to aid the producer in obtaining better prices for his products. By the aid of this society the bee-man is to receive about 9 cts. a pound for good extracted honey. There is very little comb honey as yet.

I here is some talk of an experiment station. If this should materialize we expect bee-keeping to receive an impetus. This year, however, is bad, as the country is full of locusts, which are eating up all vegetation.

In case any of our readers want to become missionaries we can assure them there is much to be done in Brazil in instructing the people in the arts of living as well as in bee culture. To the extent of our ability we are trying to help the people spiritually, scientifically, and physically.

Taquary, Rio Grande do Sul, Brazil.

## ARE BEES REFLEX MACHINES?

**Experimental Contribution to the Natural History of the Honey-bee by  
H. v. Buttel-Reepen, Ph. D. Translated by Mary H. Geisler.**

*Continued from July 1st issue.*

### THE LOSS OF MEMORY FOR LOCALITY THROUGH SWARM DIZZINESS, ETC.

Through swarm dizziness as well as through stupefaction (as before mentioned), memory pictures are extinguished, or, at least, are without influence.

If a so-called artificial swarm is made by sweeping the bees from the frames of a strong colony with their queen into a new hive placed upon a new stand, then all the flying bees return to the original hive, and only the young bees remain in the new one with the queen. In a genuine swarm, on the other hand, all the bees remain in the dwelling of their choice. They have forgotten their old dwelling. But it is not a complete forgetting, for, if a swarm becomes queenless within the first few days, then the bees return to the mother colony—the memory for the old home is reawakened. The extinction of the memory for locality is not, therefore, as final as in narcotization, etc. The old nerve-paths are maintained, but are no longer traveled over, because there is a diversion into other nerve-paths; but if the stronger influences are removed by queenlessness (Weissmanruhe, see p. 12), then the old-trodden paths come into effect again and adjust the direction of the stimuli in the former way; i. e., earlier memory pictures are reawakened and the bees return to the mother colony.

An extinction of the memory of locality is brought about likewise by the apparently narcotic influence of buckwheat honey<sup>79</sup> in the cases mentioned before.

Also bees kept in a dark room for many days, and those numbed with cold<sup>80</sup> appear to lose their earlier memory for locality to a certain extent. Further, the throwing of bees into water, the bathing of a colony, will cause the disappearance of the acquired power of orientation.<sup>81</sup> A colony thus handled can be placed in a different position without a return to the accustomed place of flight. Time has a substantial influence upon the disappearance of memory pictures too. In approximately five or six weeks, or often sooner, bees removed to a new position forget the influences of the old place. After this length of time the hive can be changed back and put in any chosen position of the old location without fear of the bees seeking the original spot. Memories disappear quickly if new impressions obliterate the old. If bees stay in a hive, wintering for months, therefore receiving no new place impressions, the impressions which were received before the wintering commenced remain. In very many cases it can be determined certainly whether a transference shortly before the first spring flight can be undertaken without much loss to the colony. If the first weather for flying is inauspicious, as is generally the case, and the temperature scarcely reaches the 7° to 8° C. in the shade necessary for flight, the bees fly out, lingering for only a short flight with slow orientation, and execute the necessary cleansing. They thereby impress upon themselves the new position. But if, as happens now and then, after a long period of cold, a relatively very warm spring day breaks in, the excitement in the hive is great; thousands press forth, and many hasten off for a longer flight with only a hasty, careless orientation. Under such circumstances a greater or less number, in coming back, return to the old place.

François Huber<sup>82</sup> reports that in the fall he had fed some honey to great numbers of bees from a window; then the honey was taken away and the hives were kept closed all

<sup>79</sup> "If the buckwheat-honey flow is strong, then the bees seem to be unmistakably intoxicated, and they go into the nearest hive-entrance with filled honey-sacs. The observation has been made that hives which are passed over by bees from hives standing further back increase perceptibly in population and honey at the cost of the hives behind" (Bw. Centralblatt, Nr. 3, p. 35, 1894).

<sup>80</sup> Deutscher Bienenfreund, 35, Jahrg. 1899, Nr. 4.

<sup>81</sup> François Huber, l. c. In men, after a violent illness, after a concussion of the brain, after stupefaction, after poisoning with carbon dioxide, etc., a loss of memory and retrograde amnesia occurs (Aug. Forel, Das Gedächtnis und seine Abnormitäten, p. 37, ff.; Zürich, 1885; A. Goldscheider, Die Bedeutung der Reize im Lichte der Neuronlehre, p. 28, ff.; Leipzig, 1898).

<sup>82</sup> Nouvelles observations sur les abeilles, 2d edition, 2 vol., Paris and Geneva, 1811; German by Kleine, Einbeck, 1856; English editions in 1823 and 1841.

winter. When they were again opened in the spring, the bees came again to the window, in spite of the fact that there was no longer any honey there.

Bethe (l. c., p. 90) asserts as follows: "If bees cease to fly in autumn, then (as I have proven myself) hives may be placed even inside a circle three kilometers in diameter, each in a chosen spot. The bees do not return to the old location of the apiary when they begin to fly in the spring, but from the first come to the hives in their new positions."

This experiment of Bethe's is not conclusive and I would not recommend any investigator or bee-keeper to try it in the way described, for in nearly all cases all the flying bees will be lost.

If, following Bethe's suggestion, a colony is put in a different place in the fall when "the bees have ceased flying" because of the cold weather, one can not tell whether, in spite of the apparent approach of winter, in the next few days or in the first three or four weeks, a warm period with weather suitable for flight may not set in, during which the bees still have the old position securely in memory. If this happens (and it frequently does), then all the flying bees return to the old place and are lost. The next spring, of course, no return to the old locality can take place, for all or nearly all that would recognize the former position are already dead.

#### ASSOCIATION OF IMPRESSIONS.

During a dearth of honey, when bees are usually excessively fond of sweet things (see p. 26), a few bees discovered a honey-comb in my study, flying through the open window. More and more nibblers came, some of them getting caught at the second closed window. To prevent that, I placed the honey-comb in the opened window itself. When, half an hour later, the bees were flying back and forth I drove them away from the honey and closed the window. After perhaps twenty minutes I went into the bed-chamber above the study, the windows of which stood wide open, and found it full of bees. By this time I was observant, and after driving out the searchers and closing the window I went into the garden and noted their behavior accurately. They attempted in vain to press in at the window where I had fed them, then from time to time some flew to the next window and tried their luck there, then further to the next windows above, always keeping about a handbreadth above the window-sill, the height at which the honey had been in the window where they were fed. Thus I noticed bees seeking at all the windows of the house.

If the bees had actually associated impressions and connected the attainment of honey with the form of a window, then it was to be supposed that they would extend their search to the windows of the neighboring house about ten steps to one side, which, in fact, happened.<sup>83</sup>

#### MEMORY FOR THE FEEDING-PLACE IN THE HIVE.

If an inner glass or wire-gauze door is kept closed, the back door of a hive may be opened without the bees getting out. Between these outer and inner doors there is usually enough room to place a feeder. If this is filled with honey or sugar syrup, the bees can reach the food when the slide in the glass door is opened, the outer door being closed. If one is feeding for the first time, the bees may be guided to the honey by placing a few upon it, or in some other way, for otherwise they do not transfer the food as quickly as may be desired, because it takes some time for them to find it. To prevent the excitement caused by feeding, this was done in the evening, and the empty dish taken out the next morning, the slide of the glass door being again closed. But on the next evening, or the one after, I noticed many times that, if I opened the glass door, the inmates streamed out so quickly that I had to hasten to close the outer door in order not to crush any. Also, if the feeding were done in the open air the bees often came hours and days afterward to the place where they had once obtained honey.

<sup>83</sup> Under the designation, "Instinct or Intelligence," I find in the American Bee Journal, Chicago, 1892, the following note: "If a dish of food is placed on the trunk of a tree, bees will soon search for honey in the same place on all the trees in the neighborhood. A similar thing happens if bees are fed from a window facing south. Soon bees are discovered seeking at the south side of all the neighboring buildings."

It would be difficult to doubt that here we have to do with memory processes; for if bees are reflex machines, following "chemotropically" only adequate mechanical stimuli; then we can not understand why, when the stimulus has not been present for a long time, they react again and again as if the stimulus still existed. A plant never reacts heliotropically or chemotropically to a past stimulus, etc., if the respective stimuli are no longer acting upon it. But here we see movements set loose, although the cause—the honey on the feeding-spot in this case—no longer exists. We see bees once fed, often, after two days, seek that place in vain; but then they modify their procedure; they learn that there is no longer anything to be obtained there, and cease from further flight, often after a few hours, as before mentioned.

#### CONDUCT OF BEES IN THE BUCKWHEAT SEASON.

If colonies stand in buckwheat, the flight is lively in the mornings until about ten o'clock; then it lessens, and is entirely quiet for the greater part of the day, beginning vigorously again the next morning. The buckwheat honey flows only in early morning; so, as the nectaries dry up, the bees fly out a couple of times and then discontinue their vain flight. In spite of the shimmering sea of flowers, in spite of the strong fragrance, only a few bees may usually be found after ten o'clock in the buckwheat-field.

Here the stimuli of color and scent are constantly present, and there is also the habit of daily flight to the same fields; and, in spite of that, we see that flying is discontinued. Here, undoubtedly, as well as in the preceding feeding experiments described, the processes of learning and remembering may play their important part.

#### ARE BEES ATTRACTED BY THE COLOR OF FLOWERS OR BY THE NECTAR?

This might be a good place to consider briefly this interesting question. While Plateau<sup>85</sup> substantially advocated the view that bees are attracted chiefly by nectar and not by color, it was above all Aug. Forel<sup>86</sup> who stood almost alone in opposition to this view, based on many years of admirable experimentation. Recently some younger investigators have been associated with him, who can experimentally verify his conviction that it is chiefly the color which serves to attract. Upon the foundation of the work of Forel, Andreae,<sup>87</sup> Giltay,<sup>88</sup> Detto,<sup>89</sup> Kienitz-Gerloff,<sup>90</sup> we can establish as proven the statement that the honey-bee, *Apis mellifica* L., is attracted substantially by the color of flowers, and not mainly by the nectar. The color of the flower is indeed a gay flag which proclaims at a distance, "Here there is something to sup."

That bees observe flowers keenly, follows from the fact that single bees in foraging practically never visit two kinds of flowers, but always hold to one kind. This may easily be seen by examining the pollen-sacs on the return of the bees to the hive. One color of pollen is always seen; a mixture of colors, I have observed but once.

#### PLACE PERCEPTION IN THE QUEEN.

In the literature of apiculture the observations concerning the memory of locality in the queen, so far as the duration of this memory comes into question, diverge very far from each other. Some say that she has capacity for remembering her hive, the outside and surroundings of which she learned to know in her single virgin flight, for more than three years; others say, for some days or weeks. The source of failure in these observations is connected with the frequent unnoticed changes in queens going on unaware of the bee-keeper. He often thinks that he still has the old queen in the hive when she has been replaced for some time by a new one.

<sup>90</sup> Kienitz-Gerloff, Professor Plateau und die Blumentheorie I. u. II. Biol. Centralbl., 18, 1898, u. 23, 1903.

It is true that queens which fly away from the comb just taken out of the hive usually get lost because they can not find their way home.

I made the following observation: When a queen flew away as just described, I stood perfectly quiet, exactly as I was when she flew, in the hope that, if she had no memory of her hive, she would surely return to the place from which she flew, since bees which have not before oriented themselves always go back to the place from which they flew.<sup>91</sup> After barely a quarter of a minute, in fact, the queen sank down again, not on the comb, to be sure, but upon a little piece of board which lay in the grass a step distant. There I caught her easily and put her back in the colony. In keeping quiet and not changing the surroundings I followed an old bee-keepers' rule, a practice developed from much observation like the above.

But it has, undoubtedly, been established many times by reliable observers that a queen finds her way surely to the entrance of her hive a month after her marriage-flight.

A young queen often errs when the hives stand very close together, if she returns hastily from the marriage-flight. If hives from which flight will take place are marked, therefore, for example with a twig covered with leaves,<sup>92</sup> her return is very much more assured. This is proof that the queen impresses accurately upon herself the appearance of her dwelling.

#### MEMORY FOR LOCALITY IN SCOUTING BEES.

In the behavior of the so-called scouting bees we find one of the most conclusive proofs against the vague hypothesis of an "unknown force." They prove most emphatically, in my opinion, that an orientation truly takes place through the sense of sight, through memory pictures.

I can not here deny myself the pleasure of inserting the interesting information about scouting bees which Baron v. Berlepsch, the so-called Bee Baron,<sup>93</sup> sent to the *Bienenzeitung*, VIII., No. 7, 1852.

"Annually, about swarming time one often sees bees in considerable number at holes in the walls and crevices of old buildings, walls, and trees. They creep in and out, apparently seeking something, run anxiously outside and back, flying to and fro. They buzz about as if in front of the hive, and one must have considerable knowledge of bees to be able to distinguish these so-called scouting bees from the true colony. Even if there is no room behind the hole or crevice, I have often seen them forming a cluster before one from six to eight inches long, two or three inches broad, but not at all deep. In so doing they were always uneasy, which does not happen, as is well known, with bees in front of a real hive. These bees are usually regarded as belonging to colonies about to swarm, sent out to find a good place for quarters for the next swarm, hence the name scouting bees or quarter-makers. I see these bees every year at the crevices of the old knight's castle, and in the garden wall and the barn gable. These crevices are often hardly one inch deep, and one-half inch wide, so that there is not room for even the smallest after-swarm. My observation that, although indeed no year passed in which not one but most of my after-swarms escaped, a swarm never alighted here, led me to doubt the common belief; and in 1844 I determined to make very exact investigations and experiments, and to take careful note of everything. When, therefore, on May 12th of that year I first saw bees on the edge of the wall, I had them sprinkled thoroughly with chalk toward evening by my usual helpers, and the gardener and I stood in front of the hives to see to which the bees belonged, and whether they were all from one or from more than one hive. Soon coming in, they all entered No. 77 ('Solomon the Magnificent'). Early the next day they were on the wall again, and so it went on for four days. Each evening they were powdered, and their return carefully noted (scouting bees had in the meantime appeared at many other places). They belonged, undoubtedly, to the magnificent Solomon. Finally on the 17th, about ten o'clock, the powerful 'Padischah' swarmed out with a formidable host, went in the direction of the scouting bees, but hung on a dwarf tree hardly

<sup>91</sup> Orientation begins, therefore, at the moment of the flying out (see Box Experiment, p. 23).

<sup>92</sup> Dathe, *Lehrbuch der Bienenzucht*, 1892; Bensheim, p. 279.

<sup>93</sup> As is well known, v. Siebold, demonstrated Parthenogenesis in bees for the first time upon the estate of v. Berlepsch in 1855 (see "Wahre Parthenog-nesis bei Schmetterlingen und Bienen; Leipzig, 1856, p. 110 and following).

twenty steps from the hives, fully exposed to the burning sun. I let them hang, and remained standing near. About eleven o'clock they again broke loose, soon alighting in a somewhat shadier place at a short distance, remained there until three o'clock, broke up very quickly for the third time, and went over the garden pavilion toward the open fields. My assistants ran after them. I mounted a horse as quickly as possible, and galloped after them. Before I came up to the assistants the swarm was lost to sight, and we have it yet to see to-day. The scouting bees were still on the wall, went back again in the evening to No. 77, and appeared early on the 18th. This reappearance was indeed a disappointment, for, powdered on the evening of the 18th, they all entered No. 7 ('Dr. Franzia'), and not one to 'Solomon.' On the 19th, quite early, I had the crevices in all places carefully closed with lime, and put up a straw hive with an alighting-board. The scouting bees came, at first crept behind the hive around the closed crevices, then took possession of the hive. I tilted it frequently to see what the bees were doing inside. I saw little; they ran around anxiously as if they might be cleaning out the hive. On the same day at noon a swarm emerged from 'Franzia' and, after changing its place twice, finally alighted about four o'clock under a shady linden-tree. Here it could be observed comfortably. Single bees flew in all directions, each time mapping out the place with the usual circling flight, then returned; and here the swarm hung over night. With the first shimmer of morning red, there I sat again with my assistants, the garden doors open on all sides as on the previous day, the groom (all the implements for capturing swarms on his back, a true Cupid with arrows) at a short distance with two saddled horses. At 5:30 I saw more bees fly quickly toward the south without circling, and none returned. At 7:30 the swarm broke away again, flying low and very slowly in a southerly direction, and the leaders could be distinguished rather clearly. The groom hastily mounted a horse, and I went running *ipsissimis pedibus* beside the head of the swarm nearly to the end of the garden, ever more and more convinced that the swarm knew where it wished to go. The assistant brought out the other horse. I threw myself upon it, hastened out of the garden, and followed the groom through thick and thin. We followed well at a moderate trot for a quarter of an hour, but finally the swarm went so quickly, always at a height of between four and nine feet, and in a southerly direction, that we had to ride indeed *en carrière*. We came to the next village, not three quarters of an hour's ride distant, and the swarm went into a farmer's garden. I went over the hedge as if in hunt, was in the middle of the swarm with the horse, and then saw it enter a hollow pear-tree. This move took place with such celerity and surety that it seemed to me that the swarm without a doubt had chosen this place in Seebach (through scouting bees). A capture without smoke was not to be thought of, so I begged the owner to let me stay in his Eden for a while (for I would smoke out the swarm for him the very day into a hive, and leave it to him as his property). After scarcely twenty minutes the bees began to carry out little chips from inside the tree, went foraging, etc."

Can we explain this interesting procedure only upon the ground of an "unknown force leading back to the hive"? Can we explain it without accepting the existence of a memory, a capacity for orientation through the eyes, through memory pictures? I think not in the least.

Must we not here acknowledge a means of communication, a method of understanding which does not rest upon odor reflexes? I can not think of this going on without some means of understanding, and I presume that the scouting bees lead the swarm by an alluring sound which naturally can not be observed.

It is noteworthy that, of 60,000 to 80,000 bees, about fifty to a hundred serve as scouting bees; but, peculiarly enough, only before the swarming of the unwieldily, usually low-placed first swarm (often with an old queen heavy with eggs), while the colony never or very seldom sends out scouting bees before the issue of the light-footed after-swarm which with the unfertilized easily flying queen generally alights high up.

Now and then the scouting bees make it very convenient for the bee-keeper by selecting an empty hive and leading the swarm there.<sup>94</sup> Dishonest people who wish to capture

<sup>94</sup> Deutsche Bienenz. in Theorie u. Praxis, Nr. 9, p. 144, 1899.

swarms not belonging to them put out so-called bait skeps, or hives; and if the scouting bees discover these they often lead the swarm there.

One of the highest colonies ever found (300 feet high) was in the statue of Liberty on the dome of the capitol in Austin, Texas. How high the scouting bees must have flown to discover this strange place,<sup>86</sup> and what power of allurements the explorers must have used to be able to lead the colony to such an unaccustomed height!

#### THE EYES OF BEES.

Before we turn further to other interesting observations concerning the memory of locality, let us inquire why there are such large well-developed eyes in the three kinds of bees, if orientation through the sense of sight be denied. This is no idle question, for wherever eyes are but little or not at all used, a gradual stunting takes place, etc.; thus, for example, to restrict ourselves to social insects, in the ant, *Solenopsis fugax*, the workers possess eyes with six to nine facets, while the workers of *Apis mellifica* have about 4000 to 5000, the drones about 5500, and the queen about 5000 facets on each eye, besides the three ocelli which are apparently for distinguishing near objects.<sup>86</sup> Bethe has since rejected the statement that the ocelli are probably used for seeing near objects, as incompatible with the "first principles of physiology." I thereupon replied that the renowned physiologist Johann Müller was the first to advance this view, and that observations in natural history confirm and even substantially support it. I have communicated the details in my "Stammesgeschichtlichen Entstehung des Bienenstaates" (pp. 90-95), Leipzig, 1903.

Bethe credits bees with only "a slight capacity for receiving light stimuli" (Bethe, p. 82), basing his view upon an experiment which I on the other hand can not consider convincing. If a large screen be placed in their way, the routine-loving bees will follow the usual path of flight until within 1 to 1½ meters of the obstacle, then suddenly rise and fly over it. But this does not prove conclusively that the bees had not long before seen the immense screen (two and a half meters high and three meters broad). They follow freely the accustomed path as long as possible. Bethe himself says "that a once used correlation of movements may be retained for a long time" (Bethe, p. 92).

In order to experiment to see that bees, instead of being "near-sighted," are very far-sighted, stand at a distance of about ten steps from the hive at the time of the buckwheat bloom, the nectar of which, as already mentioned, excites bees extraordinarily. The bees coming out from the hive-entrance quickly, wholly indifferent as to the direction of the wind, leave painful proof of their ability to see; and a man presents a considerably smaller surface than the screen before mentioned.

"According to our knowledge, everything in living nature has a purpose" (Bethe, p. 19); therefore the very large eyes of bees must be for the purpose of guiding the insect safely and well.<sup>87</sup>

The brain of the bee, very strongly developed in comparison with those of other insects, is certainly not without purpose. The powerful optic lobes (*Lobi optici*) prove unquestionably the great share that the eyes have in the nervous processes.

#### THE FLIGHT OF ORIENTATION.

How much bees need eyes in flying out from the hive, shows in a very clear way from their striking behavior during the first flight. As the bees fly out they turn their heads toward the hive, and in the continuous hovering up and down (resembling the gnat's dance), the hive itself, the neighboring hives, and the bee-house are surveyed; and, indeed, I repeat it, the head is constantly turned to the hive, so that even a slight flying backward is shown. This is the so-called first-play (*Vorspiel*)<sup>88</sup> which is not taken into consideration at all by Bethe, and has not been considered by him as a specially characteristic proof of the orientation by the sense of sight. After this short preliminary flight, small and then larger orientation circles are taken, and thereby the near and distinct surroundings are impressed on the memory.

<sup>86</sup> American Bee Journal, 1892, Chicago.

<sup>88</sup> Thos. Wm. Cowan, The Honey-bee, its Natural History, Anatomy, and Physiology; London 1890; German by Gravenhorst; Braunschweig, 1891. a. o.

<sup>87</sup> Up to the present time no one has doubted that the house-fly (about 5000 facets), or the dragon-fly (about 12,000 facets), orients itself during flight solely through the excellently developed eyes.

An old bee flies out from the entrance, if the forage is rich, directly and swift as an arrow. It darts from the entrance through which it has often flown, and knows its path of flight. A young bee flying for the first time must first make a flight of orientation. This is a conclusive proof that bees learn."

#### THE FINDING OF THE HIVE THROUGH THE SENSES OF SIGHT AND SMELL.

While the sense of sight is sufficient under ordinary circumstances for bees to find their way home, still they use the sense of smell also under the following conditions:

If a colony has been brought from another district, and the slide is opened after the hive is in place, then the bees flying out hasten away without orientation, for naturally they do not know of their change of place, and believe themselves in a well-known neighborhood. In such cases they are seen striking out either in graded flight or mounting in the well-known corkscrew lines without turning the eyes to the hive, as is always done in the described flight of orientation. According to my observation, such bees, flying without first orienting themselves, often come back in a surprisingly short time, because, failing to see the customary landmarks, they immediately begin to seek orientation. If the newly procured colony stands between others which look like it, then in finding their way back there is what Herr Roth, the leader of the bee-keepers' school at Baden, wrote to me "a tasting with the sense of smell, which is extended to the neighboring hives." This is a striking phenomenon easily observed. An orientation with the eyes goes on at the same time, so that the real flight of orientation does not have to be carried on later.

As I have said, such unoriented bees that fly out return quickly, often after five or ten minutes, with full burdens if the weather is mild and there is no wind. In cooler weather, and with sharp wind, many go too far into unknown regions and do not find their way back.<sup>100</sup>

Bees remain out on flight seldom longer than one-half hour if the forage is near—almost never over an hour if the forage is distant and in unknown surroundings.<sup>101</sup> They then go home apparently willingly, with a half or a quarter of a full load, as one can easily see in the tiny pollen-sacs and in the slight body.

Let us now hear from Dr. Beth's description concerning a transported hive (l. c., p. 92). "Lubbock placed some honey out in a room to which some wasps came: he then closed the window which faced the nest. The wasps flew mainly against the window, but finally flew through the other open window. After a few times the greater number flew immediately to the open one. Since, however, a kind of 'accustoming,' based upon an unknown force, seems to enter in finding the way home in this experiment, I hoped to succeed in getting results by observing accurately a new colony of bees. It was bought in a village seven kilometers away, and was placed in the Institute garden about seven o'clock in the morning. At first only a few bees hummed around in the air.<sup>102</sup> A great number sat upon the flight-board and the front wall of the hive, as is generally the case in excited colonies. Between nine and ten o'clock in the morning the first ones flew away.<sup>103</sup>

<sup>98</sup> Dathé, l. c., p. 146.

<sup>99</sup> The following observation proves how little bees accustomed to the hive's place and surroundings regard the place from which they fly in their swift exit. If the second hive-entrance, which is in the upper honey-chamber (super) is opened, for days bees will be seen leaving from this entrance, but never entering it. The entering takes place constantly in the usual path through the entrance below. Only by and by bees begin to fly into the upper one (cf. p. 40).

<sup>100</sup> I quote the following from a private letter from Dr. Dzierzon, a distinguished bee-keeper to whom we are indebted for the discovery of parthenogenesis in *Apis mellifica*. Dzierzon died last year 96 years old. "There is not the slightest doubt that bees find their way back to the hive in the way you have described, guided by pictures of their dwelling and the near surroundings gathered as they flew away. Instinct is the explanation, in so far as they are led to observe accurately the position of their dwelling and the nearest surroundings in the first flight out. On account of this, as you know, in the first flight, (Vorspiel), they turn around; and, forming small and then larger circles, gain an exact impression of the neighborhood and the hive. I have often wondered at the rapidity with which they are able to do this. I brought a hive from a distant apiary, and on opening the entrance a few bees flew out, probably for water, not suspecting the removal. In the mild weather they were not lost, but came back to the same place, and soon the flying after water was going on as if nothing had happened. Thus quickly a part of the bees had become accustomed to flying in the new apiary," etc. Even though this letter contains no new knowledge of the biology of the bee, yet it seems to me that its publication is appropriate, in view of Beth's opinions following.

<sup>101</sup> As was mentioned before (see p. 19), the leader of the bee-keepers' school at Baden observed that his bees returned from a buckwheat-field six kilometers away, with full burdens, on the average in thirty minutes.

<sup>102</sup> It is a pity that we can not learn how these bees acted, whether they oriented themselves, etc. . . .  
<sup>103</sup> Accordingly this appears to have been a cool autumn or spring day, else it is inexplicable why the bees hesitated so long with their flying-out. Or was it windy or rainy weather? Or were the bees wearied with the transportation?

They corkscrewed in widening circles into the air, as bees do when they have just been set out. After three or four circles (in which note well they had never turned their eyes toward the hive),<sup>104</sup> they took their direction and flew quickly to the meadows. A great number of others followed, all corkscrewing into the air.<sup>105</sup> About three o'clock the first ones returned laden with honey and pollen.<sup>106</sup> They came from the east (not from the south whither most had gone), and flew from the place where I first caught sight of them (5-6 meter distance) in a *straight* line to the entrance. If here a noticeable accustoming had played a part, perhaps as a memory process, it would be impossible to think that the insects would fly in such a straight line for the hive. A force then must be present, which draws them like a magnet to this place in space, and the described "accustoming" is something secondary, unnecessary for the occurrence of the reaction."

Since we have not the slightest scientific proof whether these bees which returned at three o'clock, which "flew in a straight line to the hive," did not belong to those which had hummed around the hive in the early morning, and therefore had been able to notice the position of the dwelling accurately, this experiment proves nothing, because we are not informed concerning the method of the flying-out of the later bees.

Bethe speaks expressly of "accurate observations," so we must accept as a matter of course that there were no errors in his observations. If, therefore, the foregoing really happened as pictured, this experiment does not, I believe, present a conclusive proof for but against the "unknown force." According to my long years of experience, a five or six hours' roving and remaining away from the hive under the conditions described is entirely impossible. We may here, from what is known of the natural history of the bee in this direction, count upon the possibilities expressed before. Later on it turned out that the observation was not an accurate one. Cf. p. 90 of my *Stammesgeschichtliche Entstehung des Bienenstaates*. Leipzig, 1903.

If, indeed, a magnetic force existed to draw bees homeward, then without doubt the bees which flew out would have succeeded in reaching home inside of ten minutes or at most an hour after leaving.

<sup>104</sup> Bethe appears to consider this the normal flight out; above all, nowhere does he mention the entirely different flight of orientation.

<sup>105</sup> As none of these bees flew off in a straight line, it is natural to suppose that these were greatly irritated by the transportation or suffered by the lack of air during the transportation. The thick gathering on the outside points to the latter supposition, as does also the late flying-out.

<sup>106</sup> Therefore after five or six hours! Doubtless almost all the bees which flew out in the forenoon were lost, or returned again to the known neighborhood, because the village was only seven kilometers distant, for under the conditions cited an absence of five or six hours can not be accepted as true.

## BEESWAX FINISH FOR WOOD-WORK.

I read about your beeswax finish; and as I am building a new home I should be very grateful if you would let me know what kind of wood is best to use the finish on, and what proportions of beeswax and turpentine.

Springvale, Ont.

LINUS B. GOWAN.

[The beeswax finish to which we referred is made by mixing turpentine and melted beeswax in such proportions that, when cool, the mixture will be in the form of a thin paste. The proportions we used were about three parts turpentine to one of melted wax, by measure. While hot it should be thoroughly stirred. If not thin enough when cold to spread nicely, more turpentine without heating may be added.

This paste is spread upon the woodwork, covering it thoroughly; then with a brush the surplus is cleaned off, after which it is immediately rub-

bed down with a rag until a glossy finish is secured.

Nothing but pure beeswax will answer the purpose. The slightest admixture of paraffine will spoil it. The finish, while not glossy like varnish or that of hard oil, has a rich, smooth appearance that brings out very clearly the grain of the wood. Indeed, to our notion it is richer and more in keeping with modern finishes than the old-fashioned glossy cheap varnish look. It does not begin to cost as much as hard oil or any other varnish. While one may use a filler, yet it is hardly necessary, as the effect is very pleasing without it. Indeed, the wax itself acts somewhat as a filler as well as a finish.

As to woods, it looks nice on any wood, either hard or soft, although the effect is much richer with an oak or a maple than with the yellow pine. If we were to use the latter we would advise using what is known as the weathered-oak stain, then apply the beeswax finish. Our offices are all finished in this way on yellow pine, and the effect is certainly very pleasing.—Ed.]

## BEE-KEEPING IN HOLLAND.

### A Visit to the Largest Modern Bee-farm in Holland.

BY J. H. J. HAMELBERG.

Although apiculture in Holland is not of so much importance as it is in the United States it may, perhaps, interest some GLEANINGS readers to learn something about it.

Movable-frame hives have only lately come into general use. It is not many years ago that a modern hive was considered quite a novelty on our bee-farms. Of course, we have had the large Gravenhorst straw hive with movable frames, which is still a favorite with many bee-keepers, and deservedly so, as it is a hive in which bees winter uncommonly well. Its clumsiness is the principal objection. Then there have been in use the Berlepsch, the Alberti, and the Gerstung hive; but the impractical way in which their frames had to be handled, and their cost, made them unpopular. It is only after the American system of handling frames from above had become better known that modern hives gained in popularity. As yet, however, the old-fashioned straw skep is most generally used here; and, when visiting our heather-field in the right season, one can certainly count five skeps to one movable-frame hive.

It is at "The Bee," the apiary of Mr. Hans Matthes, at the quaint old village of Breukelen, where modern apiculture is practiced on the larg-

est scale in this country. Three years ago Mr. Matthes started in business with 200 colonies in straw skeps, which he transferred to modern hives, the invention of his foreman, Mr. R. Tukker, a bee-master of repute and extensive experience.

The Tukker hive is a divisible-brood-chamber hive measuring outside  $20 \times 15\frac{3}{4}$  inches square, and 18 inches high. Within this body are hung, on cleats, two separate boxes, one on top of the other, each measuring  $15\frac{3}{4} \times 11\frac{3}{4} \times 5\frac{1}{2}$  inches, thus leaving an empty space between the inner wall of the box and the brood-chamber, thus making the hive practically double-walled. Each of these brood-bodies contains 8 hanging all-wood frames  $14\frac{3}{4} \times 4\frac{3}{4}$ ; and supers with the same frames can be placed on top.

With this hive Mr. M. has to handle one kind of frame only; and, working mostly for extracted honey, he claims this to be of great advantage, although it would seem the Tukker hive could be improved by having the two brood-bodies in separate casings in order to prevent disturbing the bees when the under box has to be gotten at, which now can not be done without first lifting out the upper box and exposing the bees to the inclemencies of the weather, unless a separate super is carried around when examining the hives. However, Mr. Matthes and Mr. Tukker are well satisfied with their kind of hive.

To make the most of the honey crop in this country, it is absolutely necessary to travel with the bees. Early in the season, generally about May 15, Mr. M. goes with his colonies to Haar-

lem Lake, formerly a broad sheet of water, but now converted into rich farm land, where cabbage and mustard are extensively cultivated for seed. Fruit bloom with us falls about the same time, but the yellow cabbage and mustard flowers yield far more honey than fruit-blossoms (although not of so delicate aroma), *if* the season is favorable, which, unfortunately, has not been the case very often in recent years.

About the middle of June the colonies at Haarlem Lake can also begin gathering from the pastures abounding with white clover; but our main hopes are always fixed on the honey-producing qualities of buckwheat and heather. Unfortunately, however, the cultivation of buckwheat is rapidly on the wane, our farmers not considering it a profitable crop. On the other hand, only very poor soils are now used for buckwheat; and such soils, being mostly found in the neighborhood of heather-fields, the practical bee-keeper can look out for a place from whence his bees can work on both buckwheat and heather, the former blooming during July, the latter from the beginning of August until the early part of September, and sometimes later. However, one night of frost, such as we had last year as early as the 25th of August, will stop the honey-flow at the heath at once.

Until now, Mr. M. has not favored any foreign race of bees. He sticks to the common black bee, believing this kind to be best suited for our changeable climate. Neither has Mr. M. discarded altogether the old-time straw skep. When properly made, viz., with walls two inches thick, bees winter uncommonly well in them,

and very often they will begin brood-rearing in them some weeks before they do in wooden boxes, thus giving earlier swarms. Besides, a good many Hollanders are not yet familiar with extracted honey, preferring the comb honey of their youth, especially when gathered on the heath (we being a conservative people, Mr. Editor). To gratify this taste, Mr. M. had made very attractive-looking flat tin boxes of a size to contain a square piece of comb honey of exactly one pound. For the filling of these he mainly depends on the produce of the straw skeps, first killing their bees or transferring them to modern hives. Heather honey being almost inextractable on account of its thickness, that gathered in movable-frame hives is generally left with the bees for their winter stores.

In managing his apiary, Mr. Matthes follows American methods to a great extent, and GLEANINGS keeps him posted concerning such. He is ably assisted by his foreman, also by the charming Mrs. Matthes, whenever her household duties permit it. The old way of putting hives close together in long rows Mr. M. still sticks to, however. At home the colonies stand under cover, which can be removed in parts—a practical idea originating with Mr. M. himself. But considering he has now reached the number of 400 colonies, which he does not wish to increase, it would seem a advisable to have the colonies placed in groups with sufficient space between them to put the non-swarming methods or Heddon's way of preventing after-swarms into practice, primary swarms usually finding a ready sale at The Bee.

Compared with the reports GLEANINGS occa-

FIG. 3.—HOLLAND SERIES. RESTING AFTER A HARD DAY'S WORK.

FIG. 4.—HOLLAND SERIES. STARTING FOR THE HEATH.

sionally gives us of some harvests on the other side of the pond the production on The Bee is rather small. More than 50 lbs. a year per colony is hardly ever gathered in this country, and usually the production is far less—30 to 40 lbs. of surplus being, on an average, the yearly harvest per colony. However, as good extracted honey sells here at 35 cents a pound, while Mr. M.'s tins of comb honey find a ready sale at 40 cents each, the business can still be profitable.

Visitors are always gladly welcomed at The Bee, Mr. M.'s hospitality and courtesy never being called upon in vain. His farm is situated in one of the most picturesque parts of Holland. Readers of GLEANINGS, when visiting our country, will do well to take at Amsterdam an early train for Nieuwersluis, a trip of but 20 minutes, when a walk of about two miles through a beautiful alley of gigantic old oaks will bring them to Mr. M.'s residence.

In conclusion it may not be out of place to mention here that our government is slowly awakening from the torpor it has until recently remained in with regard to the promoting of the interests of bee-keeping. As yet our Department of Agriculture has no separate division for apiculture; in fact, I do not believe the whole department holds one

single official able to distinguish a queen from a worker. But we have one very active society for the promotion of bee-keeping, and, of late, the government has increased the subsidy for this society from \$500 to \$1000, thereby enabling it to appoint a scientifically and practically trained person to give all desired information to its members, and to expound the methods and theories of bee-keeping at public meetings in our bee-center. Besides, our organization issues a monthly review, and appoints yearly a commission chosen from our best-known practical bee-keepers and entomologists, to examine candidates for a diploma of bee-master. A program of the requirements for this degree has been carefully considered and finally agreed upon by the society, and it necessitates serious studies indeed to go up for this examination, very few candidates having succeeded until now. Some day, perhaps, we shall have one of these at the head of a separate bureau for apiculture in our agricultural department; but first, as we say here, much water will yet have to flow to the sea. However, slow but sure is our way, and so we work steadily on and don't complain.

Maarssen, Holland.

[It has been supposed that a very highly cultivated country would be unfavorable to bees; but the foregoing article would indicate otherwise, for no country surpasses the Netherlands in this respect. Probably the results per acre are 100 per cent greater than the best portions of the United States. It is evident that the Dutch are fast adopting the latest ideas.—W. K. M.]

## NAILS FOR SUPPORTING FRAMES.

### Leaves for Winter Packing.

BY LEVI HUMMELL.

I make my own hives, which are 18 inches long, 12 wide, and 12 deep inside. I made the frames after the Hoffman pattern, with the exception that the top-bar does not extend out. For a support I use a finishing-nail. I think if more would use nails to support the frame there would not be so much trouble with propolis.

I built a bee-house 8 ft. wide and 10 feet long. In it I can winter 44 colonies packed with leaves. Winfield, Pa.

[The use of nail supports as here described has been before mentioned. We have tried them, and so have others. The trouble seems to be lack of strength, and, moreover, they are unpleasant to handle; but some, doubtless, will like them.—ED.]

## BEE-MOTH.

### How and Why it Becomes Destructive to Stored Comb Honey.

BY WM. W. CASE.

It is not the intent of this article to enter upon a dissertation on the bee-moth, its life, habits, etc., but to answer the oft-repeated question, "Why is it I can not keep my comb honey from being ruined by the bee-moth unless I fumigate at least twice?"

The quality of honey is never improved by sulphur, and quite often it is more or less injured by the fumigation—a process never necessary if we rightly know the conditions under which the bee-moth becomes destructive. There are but

two causes of damage to comb honey by the bee-moth. The first is slovenliness; the second is ignorance. Now, it is a well-known fact that the larvæ of the bee-moth, like all other larval life, can not grow and develop without some source of nitrogen, and that, deprived of nitrogen, it immediately dies; and when we consider that the pure honey-comb contains absolutely no nitrogen, then we must also look to some outside source of destruction separate from the comb itself—a source of nitrogen.

In stored comb honey there are just two sources of nitrogen, without which it is impossible for larval life to develop. The first, isolated cells containing pollen; second, excessive travel-stain—that ear-mark of slovenliness in the bee-keeper. No matter how healthy a larva may be at hatching, unless it can immediately find some source of nitrogenous food it almost immediately dies, after, perhaps, having gnawed a pinhole  $\frac{1}{4}$  to  $\frac{1}{2}$  inch in length—one not sufficient to mar a comb in the least—in fact, hard to detect with the naked eye, and leaving its little pink starved body in plain view on the surface. If it hatches in the immediate neighborhood of a cell containing pollen it grows with amazing rapidity, and in a very short time, especially in hot weather, may muss and spoil half a dozen sections. Prevention—store no honey containing a cell of pollen unless you expect to fumigate, and that thoroughly.

Again, if the larva hatches upon a comb more or less travel-stained it will live for quite a long time on the footprints, and in its frantic search for nitrogen it will eat almost all such cappings off before it dies, its roads (about the width of a common pin) running in all directions over the stained surface, ruining the comb, while it eventually dies of starvation—its work, however, being frequently laid to the lesser wax-moth, *Achræa griseella*, where, in fact, such lesser wax-moth does not exist.

Of course, such honey should never be placed with clean honey; in fact, there is neither business nor excuse for such honey at all, its very condition without moth damage rendering it unfit for market, and deservedly reducing the price from 25 to 40 per cent, and also lowering the tone of the whole honey market wherever exhibited.

It will be readily seen from the foregoing, that, if honey is taken from the hive when it should be—that is, as soon as sealed, and before becoming travel-stained, and each comb held to the light to reveal pollen-cells, it can be stored with the assurance that absolutely no damage can result to such honey from moth-larvæ.

A cupboard filled with more than 800 sections, without fumigation, during July, 1907, and packed for market the last week in November, revealed but three combs injured by moth-larvæ—one in which a cell of pollen had been overlooked; the other two, slightly travel-stained near the bottom, were well "roaded" as far as the stain extended.

The few if any sections containing pollen-cells may be placed where easily inspected, and, together with any travel-stained ones, may be placed in a box, and fumigated if necessary; for while travel-stained comb will rarely bring larvæ to full development, the larvæ will ruin the comb surface. Of course, where honey is left on the hive until much of it is badly travel-stained, fumigation becomes an absolute necessity.

Fumigating a large lot of honey may not always damage the quality; but it is also quite certain that the quality is never improved by it; and if not done by an expert it may not be complete enough to eradicate the larvæ, especially when well encased in roads, or, it may be, overdone to the extent that much of the surface assumes a greenish cast and a flavor condemned by most epicurean noses.

Baptisttown, N. J.

## AUTUMN OR SPRING FEEDING.

### Extracting Honey and Feeding Back, vs. Furnishing Bruised Combs of Honey.

BY J. GRAY.

I have read with interest the articles on the above subject. The truth lies midway between the two, and is equally applicable to your country and England. During my tours, extending over a considerable number of years, I have met many advocates of both systems, and have been enabled to judge the effects of both systems impartially.

Alexander is right in extracting to give the queen room. I doubt not many of your correspondents have reached the same point, only by an easier path, which I much prefer.

There are four vital points in successful spring work, each essential to the success of the colony, as follows: 1. A good queen; 2. Bees to cover her work; 3. Plenty of stores; 4. Stocks well established on good old combs. It's the third point this article deals with; it is unwise to force nature too early, hence the waiting for "settled warm weather." Bees void their fæces only on the wing, and active brood-raising means the consumption of more pollen, which means more fæces to get rid of. A bee fills its large air-sacs

with air, when on flight, by closing its spirales and contracting its muscles. It is enabled by the air pressure to empty its colon.

Autumn feeding, or reserve combs of stores, are essential up to this point of the season. Now comes the strenuous work when the skill of the apiarist must be directed toward changing a few thousand workers into a mighty roaring force. It is turning food into bees, and it matters little if the food is inside or out.

*Pollen.*—Open a typical brood-nest. Here are four combs of brood, and on either side a comb containing freshly gathered pollen. In no case shift these pollen combs. It is where the bees require it. Seldom is it necessary to feed pollen, for, with settled warm weather, the bees gather enough.

If honey is in the hive we can extract it as per the Alexander method, and feed back, or let the bees extract it, which is easier and better. Take a comb of honey; bruise it—that is, flatten it down with your spatula till your comb is level and every cell-capping broken. Place it in the center of the brood-nest, and at once the bees set to work to clean up and remove the honey, leaving a full comb nice and clean for the queen to occupy. In carrying out this work, the queen is fed more lavishly; the more the queen is fed, the greater the number of eggs, and soon she will be laying the weight of her own body in the course of twelve hours. In fourteen days this operation can be repeated, using two combs, one each side of the center comb. In fourteen days you can repeat the process, only this time your ten-frame hive can spare one comb of sealed brood and adhering nurse-bees to strengthen weak colonies. Thus the strong stocks become feeders to the weak ones; and if we reach full strength right through our apiary ahead of our harvest, new colonies can be formed. Feeding during this great activity of the colonies, much water is required, and also some feed. Take a vessel; fill it with pebbles; make your feed one pint of water to one pound of sugar, and fill the vessel. There is no fighting; but if the unexpected happens, it is easily stopped by filling up the vessel with water instead of syrup. Your feeder acts as a barometer to the various sources of nectar, for the feeder is quickly deserted for the natural source.

The method outlined means opening up the stock periodically, and feeding. Alexander reaches the same point by extracting and feeding back. The difference in the two systems is, in the first, the bees do the extracting; in the second, the apiarist does the extracting. It is for each of your readers to accept the way that best suits his locality.

Long Eaton, Eng., June 1.

## SUGAR SYRUP VS. HONEY AS A WINTER FOOD.

### Does it Pay to Trade Sugar Syrup for Honey?

BY LEO. E. GATELY.

Some eight years ago some bees came into my possession which the owner had intended to destroy. After removing all of the honey that was fit for table use these bees were taken home late

in the fall, and fed about half a dollar's worth of sugar to the hive. Imagine my surprise when, the following spring, they came out ahead of any thing else in the yard. In an experimental way, sugar for winter stores was tried on a fair part of our apiary the ensuing year; and the results obtained were so gratifying that, of late years, it has become a part of our system to feed every colony for winter.

When using the Langstroth hive, very little feeding was done; and for those wishing to avoid fall feeding I can recommend the Langstroth or a deep hive as being admirably adapted to that end. Situated as we are, in what one might call a rather poor locality for bees, where there is no heavy flow, but a moderate one lasting throughout the summer season, bee-keeping in such hives is unprofitable. Under such circumstances the brood-chamber will become literally jammed with the choicest honey, while supers will be left comparatively empty. It was for this reason that the necessity for changing from the Langstroth to a shallow frame became imperative.

A frame  $5\frac{1}{2}$  in. deep, properly handled, will throw most of the honey into the sections, when sugar syrup can be profitably substituted for winter stores. At the current prices at which honey and sugar are being offered, there remains no question as to whether trading sugar for honey can be made to pay; at the same time, it is true that the feeding of the sugar syrup can be gone at in such a way as to be decidedly unprofitable. In order to put the practice of winter feeding upon a paying basis it is, first of all, essential that the feeding be done at such a time and in such a way that the loss in syrup while being stored be reduced to a minimum. The amount of unsealed brood that may be in the hive at the time the feeding is done will usually determine the extent to which this shrinkage will occur. I have seen as much as 50 pounds of sugar fed to a colony, in small amounts, at a time when brood-rearing was at its height, and there would be less stores in the hive at the finish than before feeding was begun, though the combs would be solid with brood in various stages of development.

While there are other causes for the loss in syr-

up while being fed, such as the condition of the colonies, atmosphere, rapidity, with which it is given, density, etc., the principal factor will generally be found to lie almost wholly in the season. Too much stress can not be laid on this point, for it is the key to the whole situation. If feeding for winter be begun directly after harvest, you need not be a bit surprised if there is a loss of one-half by the time the syrup is stored and sealed. Very little feeding during the warm months will usually start the queen to laying heavily, and wax secretion will begin, even if no new comb is constructed.

Rapid feeding, I find, lessens the shrinkage in syrup fed to bees. Especially is this noticeable when feeding is done a little early in the season. Later, when the frost has stopped pollen-gathering, so egg-laying will not be started, smaller amounts may be safely given.

One other point deserves consideration; and that is, the density of syrup fed for winter stores. Regarding the shrinkage when a thin syrup is used, I can not agree with some who claim that no difference can be observed between it and that having a greater density. Too thin a syrup has at least to be worked over to a greater extent by the bees before capping, and thus becomes a further drain upon their energies, which should be conserved as much as possible at the approach of cold weather. For winter feeding we generally use a syrup containing three parts of water to four of sugar; but we

prefer a two-to-three ratio to one half-and-half. For spring feeding, the latter is about right.

Fort Smith, Ark.

[We believe it is generally considered throughout almost all bee-dom that sugar syrup as a food is superior to honey for winter. Experiments conducted over many years by our best bee-keepers have shown this beyond a question. Where the bees have a fine grade of extracted honey they will come out almost as well—so well, indeed, that it is not generally considered profitable to extract the honey and feed syrup. The cost of the labor and the loss in feeding will make up for the difference in the price secured for the honey over the sugar.

ANOTHER SMILE THAT WON'T COME OFF.

Mr. Chalon Fowls, of Oberlin, Ohio, numbers among his customers an amateur bee keeper who has the faculty of seeing the bright side of life under adverse circumstances. This picture, sent to Mr. Fowls as a postcard, shows that it pays to "grin and bear it."

But our correspondent finds it profitable to substitute the syrup for the honey—not by extracting, if we may judge by what he writes, but by so placing the shallow frames that the honey in them will be carried into the supers, where it will be in marketable shape. If he can make the bees do the extracting, or, rather, move the honey into sections, there is no question but that it will pay to trade the sugar for the honey that was taken away in the supers. But it is not always that bees will take honey from one compartment of a hive and put it in another. A good deal depends on conditions, and on how the hive is manipulated. We shall be glad to have our correspondent tell us just how he does it, for therein, it would appear to us, is the secret of his success.

We also wish to indorse what Mr. Gately says regarding the losses that one encounters in feeding, especially when unsealed brood is in the hive. If the hive is full of old bees, say during the latter part of August, after a heavy harvest, the sugar converted into brood or young bees is not a loss, but a splendid investment. Indeed, after a colony has gone through a honey-flow it will have a lot of worn-out bees which will die off in the fall or winter; and unless there are a lot of young bees brought about by a late honey-flow or by feeding, the probabilities are that such a colony will succumb before spring. By feeding the thin honey in little dribs in the fall, there will be a large shrinkage; and if there should be a lot of young blood already in the hive, with very few old ones, such kind of feeding would, to a great extent, be unprofitable. We are now using a thick syrup, and giving it in large feeds where we only desire to supply a colony with stores; but if the colonies generally are short of young bees, then we feed to stimulate. It seems to be the verdict now that it is much more profitable to feed in the fall than in the spring.—ED.]

## THE CALIFORNIA SAGE.

### Some of its Enemies; Raising Queens Above Excluders.

BY M. H. MENDLESON.

Mr. Ralph Benton, of Berkley State University, has been sent as a representative to investigate the sage-worm that is doing us so much harm here. He is competent, and doing good work. He is also experimenting in other lines of the business. Results will be published in bulletin form. Mr. Benton is teaching bee-keeping at the college, fitting young men to assist in and take charge of apiaries. Mr. Benton uses good judgment by visiting bee-keepers on this coast, getting information advantageous to his teaching. He has been making frequent trips among us. He has a fine disposition, and is capable, and is well liked at the college.

Dodder is spreading at an alarming rate among the sages and other honey-producing plants. It also does much harm in the alfalfa regions. It is a yellow fungous growth, attaching itself to the sages and other plants, and saps the life from them. It produces seed which drops to the ground and takes root (during the wet season), then attaches itself to the plants. It worries me

considerably, and I shall watch its development and general results. I have never seen so much of it as this season.

Much rust, also, is forming on the sages, turning the leaves yellow. The University professors think this rust is not harmful, but I notice that the sages are drying up wherever this rust affects it. Lack of moisture in the soil might be the cause; and cloudy, foggy, dewy nights might also affect it.

There was much frost-bitten sage this season, the frost affecting the new growth only. It then turned yellow, and new growth (after good rains came again) was checked later, from lack of sufficient moisture to develop it.

The great number of worms on the sages is remarkable. They eat to the base of the bloom and destroy the source of secretion, like the cutworm. These worms can not withstand extremes of heat from the sun's rays, and yet they can withstand a much higher temperature than the cutworm if we attempt to destroy them. The amount of heat or temperature that will destroy them will be reported later on. In the 80's they were destructive near the coast. Each season they seem to be on the increase.

All the enemies of our honey-producing plants seem to be on the increase. I think this is caused by conditions unfavorable to nectar secretion, which conditions, in turn, are favorable to their development. Cool cloudy weather is favorable to the development of the cutworm; the same for this worm. The difference is, these sage-worms are so very much smaller that they can get in the shade away from the rays of the sun.

For the past few years California has not been the great honey-producing country as of yore. Bee-keepers here are of a hopeful, persevering class; but these continuous adverse seasons are a trial to any patient person, and eventually will cause many to look for other sources of a livelihood.

For the past few weeks I have been quite successful raising many fine virgins above a queen-excluding brood-apartment, to supersede old worthless queens below; but one needs plenty of bees in the super to protect and keep cells warm. If there are insufficient bees in the super to cover cells well, then I raise up some capped brood and some advanced larvæ. There must be plenty of bees in the super, with some honey coming in, to insure success.

Heretofore I have had many fine queens raised and fertilized from the super, the old queen continuing egg-laying during the whole process—a continuous increase of bees coming on without loss of time. To me it is the best practical method to supersede old queens, and for divisions and surplus of queens for out-yards during the beginning of the season, and especially during short seasons when laying up honey for winter stores. It is a poor success when the honey-flow slackens, for then cells will not be drawn out. I am thankful to Mr. Doolittle and others for this process, with some of my own methods combined.

I had Mr. Erwin Williams, of Colorado, raise many fine queens for me one season by the combination of the Doolittle, Alley, and Atchley methods, all from the super. That season in two

of my apiaries there were about ten per cent of the colonies with two queens in a hive, and Mr. Williams had some difficulty in introducing until finding both queens.

These off seasons are the ones to supersede old stock when we can have more time to examine each individual colony properly.

Our seasons are so varied, or have been so for the past number of years, that we can not judge the future by the past. It is necessary to be prepared with one's cup right side up; consequently when good seasons approach, good results may be accomplished. It is best to have supplies on hand and made up, and protected from the vermin and the elements, even if we have to wait for the seasons of flow, providing one's means permit; otherwise it pays to do with fewer bees.

Speaking about the varied seasons in California, one year I extracted a carload of wild-sunflower honey, and also a carload from phacelia before the sages came in, but never before or since have I extracted much of either of these grades. The above bloom has since varied as to the time of its appearance.

I have noticed, with but few exceptions, that bees will not work on or gather from inferior sources when there is an abundance of the superior honey like that from the sages. In 1884 one colony out of 200 gathered exclusively from an abundance of mustard bloom; the 199 gathered from the sages. This was an exceptional extreme.

With but few exceptions these out-of-season blooms are our short seasons, or seasons of failure.

If all California bee-keepers would breed up their colonies during these seasons of partial failure they could greatly increase their profits. It is short enough as it is, and all are not able to do so.

I am now breeding from a queen whose colony has done wonders for such a bad season. It is now three stories high, and nearly full of honey, while many others are needing stores for the winter. An apiary bred up from a colony like this will produce good profitable results, and is of high value.

All California bee-keepers who have kept all weeds cut clean from their apiaries will save themselves a great deal of loss and trouble thereby. A clean apiary lets in the sun, keeps down dampness, and helps much to prevent spring dwindling. The worst-affected apiary from "tremors" I have ever seen was one shaded by weeds, and, consequently, damp. Many a fine apiary has been lost by letting the weeds grow and dry up, awaiting the destructive mountain fires during the dry season. Brush and weeds should be cleared away from the apiaries and buildings for a hundred feet or more. It pays to take time to do this.

By a clean-kept apiary many bees and an occasional queen can be kept from loss from vermin. Of course, skunks must be killed off also. They do a great deal of damage here as they are plentiful.

Much more honey can be produced by keeping obstructions to the entrances down for a good distance from colonies. To us, time is money: to bees, it is honey. It pays to be orderly. Putting things in their proper places saves time and worry when we need them. Hoes, shovels, etc., after using them, should be put away

clean and bright. They will work the smoother and better, and it prolongs the life of them.

Many useful cleats and boards are wasted for want of order. If kept from under foot, and put in convenient places, it many times saves dollars when needing them. It is the cents that make the dollars. It does not pay to make a practice of piling up useful things promiscuously for future time to place. That time never comes.

When working with your bees, set your lids, supers, combs, contrivances, and tools within easy reach. Tools dropped on the ground are sometimes lost or ruined. You can do more work, and save valuable time, by saving useless steps.

It pays to watch your bees and give them proper attention at the right time. Colonies should not always be left to supersede their queens. Conditions are not the same with all colonies. I always have complete success if I am well and have time to attend to each individual colony. Many good colonies could have been saved this season if confined to space according to strength and a limited brood-apartment. It is better to have queens crowded to the limit with winter stores.

This is the season for those who are fortunate enough to have a fumigating-house. It would pay for itself many times over—that is, if one has a large number of empty combs on hand. Such combs are a boon in the following good seasons.

There will not be enough of the best honey produced in California this season for home consumption.

Ventura, Cal., June 10.

## SUPERANNATED QUEENS.

**How They May be Utilized to Good Advantage in Rearing Queens; Why it is Not Best to Kill Queens on Account of Age; Conditions Under Which Two Queens Live Peaceably Together, and When Not.**

BY R. BEUHNE.

[When Mr. R. Beuhne was here last spring, the plural-queen discussion was then on, or, rather, we had decided to close our columns to it for the time being. Mr. Beuhne has had a very large experience in rearing queens under the superseding impulse, and using two queens in a hive at a time. Now that the discussion is opened temporarily we thought best to allow him to present one phase of the question that has not, so far as we remember, been exploited in these columns. It is our opinion that it will help to explain conditions when two queens will live together and when they will not. We commend this article to expert bee-keepers, who will find it of much value.—Ed.]

Fifteen years ago I made use, for the first time, of the two-queen system for raising queens. Finding two laying queens, mother and daughter, in one hive, I removed the young queen to supply a queenless stock. A month later I found another young laying queen in the same hive, as well as the old one. It then occurred to me that, if I possessed a number of such hives, I could make use of them for raising first-class queens, such as are raised under the superseding impulse.

The first requirement I found was three-year-old queens in strong colonies. By reference to the record-book I located them and supplied them with a cell, each started by the Doolittle method. In almost every instance the grafted cell was accepted and drawn down into a beauti-

ful cell from which, in due course, I got a laying queen, while in every instance the old queen was also still there. I removed the young laying queens and started another cell in each hive. I continued this until the end of the season, leaving the last young queen in the hive to winter together with the old one, which latter would, however, always be missing in spring.

This method I practiced for three or four years; but being unable in this way to get sufficient queens three years old, I next tried it with two-year-old ones, and then trouble began. In some cases the cell was not accepted; in others the newly hatched virgin would kill the laying queen; and in others, again, the bees would kill the virgin queen, and once in a while there would be a swarm when the cell was sealed. I therefore abandoned the idea of using two-year-old queens.

To save time I gave some of the colonies with three-year-old queens from three to six cells each to raise, and when these were sealed I removed all but one, giving the spare cells in cell-protectors to other like colonies, from which the young laying queen had just been removed.

To save time still further I kept the spare cells, after removal, in a super till within a day or two of hatching, when I would use them as before; but here, again, I was up against trouble, for the newly hatched virgins were nearly always thrown out or worried. Evidently the bees had not yet become aware of the absence of the young laying queen; for when I gave another cell, some days after, the virgin would be accepted.

Thus I continued till three years ago, when I succeeded in getting another queen fertilized in a super above a queen-excluder and an upper entrance by putting a sealed protected cell in the lower chamber containing the old queen, and another one in the super containing some combs of brood in all stages. Thus I got two young laying queens at the same time from a hive having a three-year-old queen, the old queen laying all the time. To succeed, it is, however, necessary that the colony be strong, and bees flying freely from the upper entrance; for in a colony of only moderate strength the virgin in the super will worry at the excluder in an effort to get below, and usually enter at the lower entrance when returning from one of her flights.

Two years ago, having some old queens to spare which I wished to keep in reserve, I introduced these in the supers of colonies with old queens below the excluder, and next gave a cell each below and above the honey-board, got a young laying queen at top and bottom as I expected.

In speaking of old queens I do not wish to be understood as meaning useless and exhausted queens, but those which at three or even four years old are still of (and sometimes above) average prolificness. Old age in a queen is a quality, not a defect. I kill many queens before they are three years old, but never because of it. If we kill all queens when two years old we can not breed for the longevity of queens, and therefore of workers, which is such an important factor in honey-production.

Another use for three-year-old queens, I find in replacing inferior or undesirable queens, particularly at times when it is difficult to introduce young laying queens, owing to robbing or cli-

matic influences. I replace the condemned queen with a three-year-old one and a week later give a sealed cell. Within a fortnight I have two laying queens. I then shift the old queen to another colony for the same purpose, and so on. During last season some of these old queens passed through six and seven hives in succession, and finally into nuclei. These old queens are always readily accepted anywhere.

For the purposes enumerated, I find the two-queen system very useful and profitable; but for the purpose of increasing the worker force and the yield of honey it is not a success in my experience. Early in spring, even a poor queen lays all the eggs the number of bees then in the hive can attend to. Later on the amount of brood raised is regulated more by the workers and the conditions of pollen and honey supply than the prolificness of the queen, provided the queen is of average capacity. If she is not, it is better to replace her than to give another queen to assist her, because her drone progeny is undesirable for breeding. Under unfavorable conditions queens lay numberless eggs which are never utilized by the bees. It is, however, possible that, under certain conditions, two queens in a hive may produce better results than one.

Tooberac, Aus.

[When Mr. Beuhne was here he made the casual remark that he could explain why it is that two queens sometimes can not be maintained in a hive, and why, under other conditions, they may live in peace. Said he, "You must have considerable difference in their ages before they will work together. The old queen must be failing, or at least three years old, before she will tolerate a younger one by her side. Of course," said he, "during the honey-flow, by use of perforated zinc, two queens of the same age can be kept in a hive; but after the harvest one of them will be missing." In the case of mother and daughter or of a young and a three-year-old queen there seems to be a sort of notion in the colony that the old queen will soon die, and whatever good she may do in egg-laying is just that much to the good. Apparently the young queen acquiesces in it—at all events, the old queen sooner or later disappears.

If this teaching or this theory is correct, it may explain a good many things in bee-hive economy that have hitherto been a little hazy.

But it seems Mr. Beuhne visited Dr. C. C. Miller, and during the course of that visit they discussed this very question. We will now let the doctor tell what he thinks of it.—ED.]

## THE EUCALYPTUS HONEY OF AUSTRALIA.

### Mating Queens from a Colony that is Superseding an Old Queen.

BY DR. C. C. MILLER.

There are some bright bee-keepers in Australia, even if they do stand on their heads. I had an interesting call lately from one of the foremost—Mr. R. Beuhne. I had always pronounced his name Bu-ny, thinking of him as an Englishman; but a lingering brogue betrays his foreign

origin, even though he left Germany 25 years ago, and so his name is pronounced Boi-nay.

Mr. Beuhne is a genial and interesting talker, and I learned some things. I have always admired the persistency with which Australians seek to make a London market for their eucalyptus honey; but after having sampled it I could hardly believe that any but depraved tastes would take to it kindly. But I've changed my mind about eucalyptus honey. Mr. Beuhne kindly brought samples of half a dozen kinds, and some of them, at least, are very palatable, and I think one would come to be very fond of them.

One reason why Australian honey is almost entirely extracted, is that, about the time sections are sealed, a plant comes into bloom that they call dandelion, although it is not at all like our dandelion, and the surface of a section is discolored by this dandelion.

One feature of that country I should not like. The heat and dryness is at times intense, and grass becomes so dry that, if fire starts in it, even though short, it may run for miles. If one wishes to fire any thing like a brush-pile, he must give 48 hours' notice to neighbors, and then be responsible for any damage that may occur.

A year or so ago my brother-in-law, Ghordis Stull, hitched a horse at a post quite a distance from the bees—so great a distance that in all reason it ought to have been entirely safe. A number of bees attacked the horse savagely, stinging it about the head and neck. My wife insisted that it was because kerosene had been rubbed on the head and neck; but I hardly believed it. From what Mr. Beuhne says about kerosene as a disturber in an apiary, she was probably right. He says that, when he is about to go into an apiary, if for any reason he has occasion to move a kerosene-lamp, instead of touching it with his own fingers he gets some other member of the family to move it for him. The odor of it at a hive not only enrages the bees in that hive, but for two or three hives distant. If that be correct, it is hardly the right thing to use kerosene in lighting a smoker.

G. M. Doolittle, at the close of the harvest, advises putting a queen-cell of choice stock into any colony likely to supersede its queen, and in most cases the occupant of the cell becomes the ruling sovereign. Mr. Beuhne goes a step further. Into a colony that has a three-year-old queen, still better a four-year-old, if she has vigor enough to keep up a fair supply of eggs he puts a queen-cell, and then when the young queen lays in company with the old queen he removes the younger queen and repeats the performance. This he has been doing for a number of years, and last year he was successful in doing so right in the middle of the harvest.

I'm not sure about it; but if I understood correctly, Mr. Beuhne does this with full colonies. Now, if this be generally successful in the hands of others, why would it not be a good thing to keep one of these aged dames in a nucleus? Would it not be more in the line of nature to have a young queen constantly superseding instead of having queenless nuclei? Is it not generally true that a nucleus freshly formed is just a little better than one that has been used for rearing one or more queens? and would not an old laying queen keep the nucleus constantly fresh?

Since Mr. Beuhne was here I've tried the thing on a small scale, only instead of a cell I've given a virgin to the nucleus. It has not been a great success. Possibly a cell is better than a hatched virgin. Possibly the old queens were too nearly played out. At any rate, so far the old or the young queen has disappeared, or both.

Somehow I'm not a great success with virgins. Others tell about a virgin killing the old queen if she gets into a strange hive. With me the virgin is taken into custody by the workers. If a young queen on her return from her wedding-trip enters the wrong hive, I am told she will kill the old queen. I once saw a young queen as she entered the wrong hive on the return from her wedding-trip, and she was promptly balled by the workers. I can have a very young virgin accepted in any colony, no matter what the age of the reigning queen, and she is kindly treated while a baby; but as soon as she begins to put on airs as an aspirant for the throne she disappears. I'm not sure but I've always failed when the queen was old; but the point I'm making is that with me the entrance of a strange virgin is not likely to endanger the queen.

This year I had an unusual case. No. 42 had a 1904 queen. I watched the case closely. May 9 I saw a virgin in the hive, and the presence of eggs showed that the old queen was present—at least had been within three days. May 22 I saw the old queen and a sealed queen-cell, but I suppose the virgin had disappeared. June 2 I saw a virgin that I suppose came from the sealed cell. June 9 I saw both queens. June 13 I clipped the younger. June 26 I was surprised to find eggs in queen-cells, and on searching I failed to find any queen present but the 1904 queen, easily recognized, not only by her old appearance but by the more distinctive fact that both wings were clipped. Poor old thing! I killed her. That young queen may have disappeared because—that's another story.

Marengo, Ill.

## THE CAUSE OF THE DIFFERENCE IN COLONIES.

BY WM. M. WHITNEY.

*Mr. Editor:*—Noting your comments on page 949, Aug. 1, regarding the difference in the conduct of colonies of bees under apparently quite similar circumstances, I feel like making further explanation of conditions which often exist in the spring, and which are often puzzling to bee-keepers. The case you mention, it seems to me, raises an important question, and one that should set an apiarist who is given to experimenting to investigating. Take the case as you give it in your last statement, that "there was a moderate amount of brood, a large amount of honey and plenty of storage room," unless you knew the queen to be old, which sometimes is indicated by drones being found in worker-cells (but then it would seem that there should have been an attempt at superseding), I should be more than half inclined to attribute the cause of listlessness and lack of energy to something else than a poor queen. In the case you mention, your conclusions were doubtless correct; but I venture the statement that in seven cases out of ten, as we or-

dinarily find them, the cause is something else than a poor queen. Carefully examine such a colony in early spring, and you are very likely to find the queen slim, or starved in appearance; "spring-poor" bees, most of them old; the cap-pings of the honey hard and smooth, and about as difficult for the bees to uncap as it would be for them to gnaw through the skin of a grape or a plum. I have had just such cases, and have watched the bees digging away for dear life to get a bare living; but after giving a couple of such combs a good scratching, then putting them next to the brood, *presto!* the whole aspect is changed; the listlessness and apathy of the colony are gone, and activity is apparent everywhere.

This suggests stimulative feeding in early spring, which I have always practiced since learning how to do it. When there is honey enough in the hive, of course it is not necessary to feed; but scratch the old comb, which amounts to the same thing.

I have had many cases parallel to the one you mention; but I will mention one specially noted at my Kankakee yard a few years ago, that of a beautiful queen not quite a year old, but a colony dragging along all summer doing only enough to live and put in honey for winter; but the next year her colony was one of the best. The same thing was true of the granddaughter of your famous old queen the next spring after getting her. She was found in early spring, lean and off color, laying drone eggs in worker-cells, and nearly half the occupants of the hive were drones; but by carefully feeding the bees she became fat and of her usual bright color, and, besides giving me, during the summer, several queens, she gave me, by division, three colonies of bees.

This I have written up before; but some have seemed to question the accuracy of my statement; but never was statement of matter of fact more strictly true. I am thoroughly convinced, as I before stated, that in seven-tenths of the failures of colonies, excepting in cases of old queens, the fault is with the apiarist. Many a good queen has been hastily condemned and guillotined.

Evanston, Ill.

## ARTIFICIAL LEVULOSE.

### Why Honey is a Suitable Food for Those of Weak Digestion.

BY W. K. MORRISON.

At the present time the United States is consuming considerable quantities of artificial sugar in the form of saccharine, which is 550 times sweeter than ordinary refined sugar. In a number of countries this substance is hedged about with restrictions so that its manufacture has been greatly curtailed. In Germany there is now only one factory making saccharine, and it is now considering whether or not it will apply to the government for an indemnity and cease to exist. By careful tests made by the best doctors in Europe, this substance has been found deleterious to the human system, even in very minute quantities, either producing kidney troubles or aggravating them. It is said Dr. Wiley is in favor of suppressing saccharine, whereas President Roosevelt takes an

opposite view. One thing is clear—it is not a useful food at all, and it would do no harm to prohibit it entirely.

The readers of GLEANINGS are not kept in ignorance of the glucose controversy, but it seems we shall ere long have to reckon with a new rival to honey—namely, artificial levulose. A few of our readers may not know that honey contains dextrose and levulose in about equal proportions. Tupelo, for example, has an excess of levulose, and alfalfa an excess of dextrose; but ordinary honey contains about equal quantities of each. Levulose does not granulate as dextrose does.

Levulose is considered excellent for persons suffering from *diabetes*, or "kidney trouble," because granular sugar aggravates the disease; hence honey is the only sweet which such patients can be allowed to eat. Tupelo honey would be just the thing for these sufferers, though there are probably not a dozen doctors in this country who are aware of the fact, and yet *diabetes* is a comparatively common disease which often leads on to death.

At the international congress of the Sugar Industry held in Liverpool, in April, 1908, Mr. Sigmund Stein, the noted sugar expert, read a paper advising the manufacture of levulose on a large scale, for various reasons. It may be used for medical purposes. First, as a food for diabetics, he says:

*Diabetes* involves an incapacity for using carbohydrates as nourishment. More or less of the sugar which is passed with the food into the body, be it saccharose or lactose or dextrose, passes through the body and acts like a poison. Levulose is recognized by the highest medical authorities as the only sugar which most of the diabetics can partake of, and which can be entirely assimilated by the organisms. Saccharine, which is used by the diabetics at present, is harmful to such patients according to the investigations of Prof. Stoklasa and Prof. Neumann.

Second, as a preventive of hyper-acidity of the gastric juice. Unlike saccharine, levulose has the power of neutralizing the acids of the gastric juices. Third, as a food for consumptives, he says:

Within the last few years a number of well-known medical authorities have recommended the use of large quantities of levulose as a remedy against consumption in the first and second degree. According to these authorities, levulose acts in this disease like a specificum, and cures have taken place, in many cases, through the daily use of several ounces of levulose mixed with the food. Without doubt the use of levulose for this special medical purpose will be better known when levulose is manufactured and sold at about the same price as our ordinary sugar. Consumption and tuberculosis are spread, as is well known, among a seventh part of the population of most countries of Europe. Levulose once manufactured cheaply will be the sugar which the consumptives could exclusively use.

Fourth, as a food for infants:

Many medical authorities have lately recommended levulose for infants, as levulose has not the aperient effect of lactose. Medical authorities have further stated that levulose is an excellent substance for the nourishment of infants which suffer from wasting illnesses. Levulose has increased the weight of such children 500 to 400 grammes per week. Professor Fuerst stated that levulose deserves the preference over milk sugar for the nourishment of infants, because the first is sweeter and has not the aperient effect.

Fifth, in industries: In confectionery to prevent crystallization; in caramel to replace glucose and invert sugar; in preserves, in the improvement of wine, and in aerated waters.

By using inulin, extracted either from dahlia bulbs or chicory roots (dandelion might do), Mr. Stein estimates the cost of manufacture at 12 cents per lb. At present it is sold at \$1.20 per lb. At the former price he thinks there would be a great demand for it.

We think Mr. Stein is mistaken. It is an easy matter to separate out the levulose in honey, and in most cases this would not cost 12 cents per lb., particularly so in tropical countries, where honey is quite cheap. The honey of the stingless bees contains an excess of levulose, showing the natives are correct in claiming it as a first-class medicine. In the valleys of the Amazon and Orinoco great quantities of such honey could be collected with ease at a price much below 12 cents a pound. It would be far superior to inulin-levulose. Bee-keepers owe Mr. Stein a vote of thanks for proclaiming to the world the great value of levulose as a sweet for sick people; but he ought to have stated also that honey contains levulose in large amount. Moreover it is in a palatable form, which inulin-levulose would not be.

It might pay tropical bee-keepers to produce levulose, even at one-fourth the present prices.

## HEADS OF GRAIN FROM DIFFERENT FIELDS

### FUMIGATING COMB HONEY IN TIGHT STORE-BOXES; HOW TO MAKE THE BOX AIR-TIGHT.

A very convenient and inexpensive way to fumigate section honey with carbon bisulphide is to line a drygoods-box of convenient size with heavy manila paper, pasting the paper in and taking care to have the paper lie smoothly over the whole inside of the box, so that there will be absolutely no chance for leakage. Then put in the sections. This may be done by placing them in loosely or in shipping-cases, putting 16 sections in a 20-section case, and placing the shipping-case in the fumigating-box so as to allow a free circulation around every section. Now put the carbon bisulphide in saucers on top of the sections, then cover the whole with one or two heavy blankets, taking care to lay two or three sticks across each saucer to prevent the blankets from coming in contact with the bisulphide. The honey will be more thoroughly fumigated than in a room specially prepared, as the fumes are required to fill only the space actually occupied by the honey. In fine weather the box may be set out of doors or under a shed, thereby running no risk of an explosion by having the fumigation done in a house. Another advantage is that a hundred or less sections can be treated, instead of waiting for a larger quantity to save bisulphide, and by so doing run the risk of worms hatching and damaging the honey. E. MEAKER.

Auburn, N. Y.

[We desire to sanction the plan given by our correspondent. Ordinarily, it is better to make use of a tight box for fumigating rather than a whole room, for the gas can be confined better so that less of the liquid need be used. If a very large quantity of honey must be fumigated, perhaps a small tight room is better; but more often two or three tight boxes can be used more successfully.]

One advantage of the box not brought out is that the honey may be removed and a new lot put in without admitting an entire change of air

as would be the case if a room were used. By holding the breath while leaning over the box, the honey can be removed quickly. If an entire room were filled with gas, it would have to be ventilated before one could enter it to take out the honey.

So short a time as half an hour is sufficient to kill all worms; and although a somewhat longer exposure might be necessary to kill the eggs, eight or ten different lots of honey could be fumigated in a day. We have successfully used a large empty extractor-can for the purpose.—ED.]

### ARTIFICIAL BEE-PASTURAGE FOR NEW MEXICO.

We should like to know what we can get to make honey between fruit bloom and sweet clover. The chief crops here are apples and alfalfa. The apples bloom early, and the first crop of alfalfa is cut before it blooms, which leaves practically nothing for the bees until sweet clover blooms. We are right by a 500-acre apple-orchard, and spraying was done last spring while many of the trees were in bloom, damaging us quite a lot.

Our climatic conditions here are somewhat similar to much of Colorado. The nights are quite cool until late in the spring, and there are times when we get no rain to amount to any thing for months. All farming and fruit-growing is done by irrigation. We are getting plenty of rain this fall. Apple-picking began in the big orchard Aug. 24. People come for miles—yes, a hundred miles and more—and camp outside the orchard during picking.

MRS. LUCY C. SLEASE.

Roswell, N. M., Sept. 9.

[We are not familiar enough with the locality to suggest any plant which would yield nectar between apple-bloom and alfalfa. Indeed, there are very few plants, unless they yield valuable seed or forage for stock, that it pays to set out for honey. If a locality does not furnish something naturally to intervene, the only thing the bee-keeper can do is to feed if the bees require stores. Possibly yellow sweet clover, which blooms about three weeks earlier than white sweet clover, might help out a little. Can't you grow alfalfarella, or pin clover? It is fine for stock and good for bees. It does not require irrigation. If any of our subscribers in the vicinity or elsewhere can suggest any forage that has intrinsic value outside of the nectar it furnishes the bees, we shall be glad to have them do so.—ED.]

### TWO QUEENS WINTERED LOOSE IN ONE HIVE.

In the fall of 1906 I had two weak colonies. I got these colonies side by side by moving them a short distance each day. When they were close together I placed one colony on five frames in a Dadant hive which would hold ten frames and a division-board. I then put a solid division-board in the center of the hive, and the five frames containing the other colony on the other side of it, tacking screen wire on top of the brood-frames so no bees could pass from one side to the other. To keep the bees from mixing up at the entrance I fitted a board to separate the front of the hive and thus make two entrances. My object was to

retain the natural heat. These colonies did not contain over a gallon of bees each, and they came through the winter of 1906 in fairly good condition. In April, 1907, after reading Mr. Alexander's experience with two or more queens loose in the same hive I examined this colony to see if both queens were alive. I found they were, then I removed the division-board, let them settle it in their own way, and during the summer I often found the two queens on the same side of a comb. I was highly elated over my success; but my spirits fell when Mr. Alexander said he had failed in wintering his queens. We winter our bees on their summer stand with a protection of straw or leaves about six inches thick held in place by 18-inch poultry-netting. As soon as the weather would permit this spring, which was the 25th of March, I examined this hive and found the two queens enjoying the joint parentage of as large a colony of bees as there is in Illinois.

LaHarpe, Ill.

O. A. PITTMAN.

#### A NEW WAY OF HOLDING A CHEESE-CLOTH STRAINER.

Several have spoken of tying cheese-cloth over the can, very tightly, to keep it from slipping down. I made a wire rack of heavy mesh wire cloth, and I hang it on top of the can. Or, if I want the strainer lower in the can, I hang it at

HAINES' METHOD OF HOLDING A CHEESE-CLOTH STRAINER.

Instead of tying the cloth around the top of the can, heavy wire cloth is used to support it.

the height desired with four wire hooks. Then I lay the cheese-cloth over the can and press it down to the wire rack, and it is always ready to use, and does not need tying. In this way it can be changed any time. G. W. HAINES.  
Mayfield, N. Y.

[The arrangement for holding up the cheese-cloth we believe to be excellent. The supporting wire cloth from beneath makes it possible to remove the cheese-cloth for cleaning much more readily than when it is tied.—Ed.]

#### QUEENS KILLED IN MAIL-SACKS.

I am satisfied in my mind, after making experiments, that it is almost certain death to bees and queens hung up in mail-pouches to be caught by trains going 30 miles per hour or more. Could you not, through the proper channels, get the postal authorities to make a ruling that mailing-cages containing bees and queens should not be put in such pouches? E. E. LAWRENCE.

Doniphan, Mo.

[We know that queens have been injured and killed in this way; but many have received the treatment without any apparent harm. We doubt if such a ruling as you suggest could be secured. The only thing for one to do who lives at a point where mail is thrown off in this way is to direct the queen-breeder to send the queen to a post-office nearest where mail is delivered when the train is stopped.—Ed.]

#### HOME-MADE HIVES DURABLE; COMB HONEY WITHOUT SEPARATORS.

On page 943, A. D. Shepard, in speaking of home-made hives, says his preference is to halve the sides and ends. Now, to halve the sides is worse than useless. Halve the ends only; then nail the rabbit solid. One can nail both ways, and, if it were painted, I believe such a hive is as good as a machine-made dovetailed hive.

You say on page 952 that honey over hives having foul brood, while not fit for brood or bees to seal, is good enough to sell or eat. Is not surplus honey free from foul brood? If it is not, is it fit to eat?

I notice a great deal of discussion about using or not using separators. I do not think people make allowance enough for difference in bees. Some do finely without separators, while others would do poorly even with them. ALBERT I. MILLS.

Ignacio, Colo.

[While honey in supers over a foul-broody colony would not be apt to contain any of the dead brood, yet some of the germs that produce the disease might be found. While such germs have never been injurious to a human being, they would develop under certain conditions if the honey which contained them were fed to the brood. For this reason it is not safe to feed honey from a foul-broody hive to the bees unless it has been thoroughly boiled at least twice. The honey should be cooled very rapidly after the heating.—Ed.]

#### A LOUD HUMMING HEARD IN A HIVE.

The other day, as I was walking around in my little apiary, I heard a hum in one of the hives like that of a bumble-bee in an empty barrel. I could hear it 40 to 50 feet away from the hive. The hum lasted about a minute at each time for the last three or four days. I may be wrong, but I think it's the queen. M. D. BREON.

Millheim, Pa., Aug. 24.

# OUR HOMES

By A. I. Root

Render therefore unto Cæsar the things which are Cæsar's, and unto God the things that are God's.—MATT. 22: 21.

*Mr. Root:*—I have enjoyed very much your articles in GLEANINGS; and as you seem to be in the business of "helping" people, may I bring to you my problem, asking that you will please help me solve it? It is that of investing money safely. There is no one among my acquaintances to whom I care to appeal. I am one of that class of women who must earn their own living (by the way, I do it mostly by raising chickens in a small way). I have saved a few hundred dollars, and I feel that it must be placed in absolute safety, for it is all I have, and health is failing. I have thought of investing in government bonds. I wish to invest \$1000, but I have no knowledge as to this as an investment other than that it is supposed to be safe. Any information or help you may offer me will be very gratefully appreciated.

The letter above came some months ago; but it has been so much on my mind that I have just decided to make it the subject for this Home paper, omitting the name and address for obvious reasons.

In the first place I wish to thank the lady for the very high compliment she pays my poor self in thus addressing me. Under the circumstances she feels that her dollars, the hard earnings of the best part of her life, *must* be placed in absolute safety, for it is all she has. Every daily paper reminds us of the folly of keeping money hidden away somewhere. Less than a week ago a man sold some stock and gave the proceeds to his daughter to carry to the bank. During the following night a couple of demons in human-form took him out of his bed and demanded the money. When he told them he had sent it to the bank by his daughter they thought it was a subterfuge, and then burned his feet with hot irons, until he will probably be crippled for life, in their endeavor to make him tell where he had hidden it. Old people and poor helpless women have been again and again cruelly tortured in just this way. What shall the people do with the money they work hard for and lay up for a rainy day? Most people say, "Put it in the bank;" and we supposed for a time that our national banks were perfectly safe. But there is a difficulty—at least there has been so far—in the way of creating banks that will be absolutely safe. I shall have to confess that I am not financier and politician enough to understand these matters. I simply know that every little while some one whom the people have trusted proves to be only a wolf in sheep's clothing; and poor widows and wash-women, and others who have worked hard and saved a little for that oft-mentioned rainy day, have found their savings for years, and perhaps for a lifetime, gone up in smoke. It is not *men* only who do these things. Mrs. Chadwick's shameless record shows that women too will ruthlessly, and seemingly without a scruple, rob and throw away the hard earnings of a multitude of poor people.

Lately it has been the fashion to commit suicide when a man found he was at the end of his string. There seems to have been a discovery—at least the prince of darkness would persuade men that it is a discovery—that one can escape the disgrace and humiliation of having it come to light that he is nothing but a traitor, by putting an end to himself. Now, I do not believe that any man or woman does escape or *can* escape

in this way. One can, perhaps, avoid meeting *face to face* the innocent victim of his treachery by shuffling off this mortal coil; but does that end it all? is the deed wiped out? God forbid. There is a good deal of complaint made because the Bible seems to teach the doctrine of endless punishment. I suggested only recently that people who commit suicide to get out of trouble are probably only jumping out of the frying-pan into the fire; and the more I think of it, the more I am convinced that no one ever escapes his responsibilities by putting an end to his life. He was a sinner before he killed himself, and he is and must be, in the natural order of things, *more* of a sinner *after* such a death than he was before. This everlasting punishment we talk about is probably the remorse or shame of having wronged and ruined his friends who trusted him, and I believe it will follow him through all eternity.

Yesterday's daily told us of a poor man who was held up by robbers, and when they found he had only ten cents and a cheap watch they pounded him all the more because they were mad at him for their poor success; and the paper stated that he would be a cripple, probably, for life, as a consequence. This illustrates the awful depravity and hellish spirit that sometimes actuates human beings. I am convinced that, if we could trace up such cases as this, we should find that the open saloons of our land are responsible for the greater part of such characters, if not all of them. When the saloons are banished entirely, such events in human history will cease to exist to a great extent, if not entirely. Now, what shall I tell this good friend of mine? and what shall I tell thousands of other good friends who read these Home papers, who have faith in my poor self? Shall I tell them to send all their money to *me* because I am honest and fully responsible while all the rest of the world is bad as—I was going to say Thomas W. Lawson; but perhaps I had better not say it. God forbid. I do not want the money, and I have no place to put it except during a part of the year when we find it convenient to borrow money at the bank, and sometimes from our friends more or less. But there ought to be some good place to put money—some place easily accessible to *every man, woman, and child*. The good woman who wrote to me speaks about government bonds. If I am correct they pay only a low rate of interest, and you can not get your money again just when you want it. As a rule, I would advise every one to put his money out at the best savings bank in his neighborhood. If you do not know just how to do this, your best way is to go to some experienced business man, a consistent member of your church, of good reputation, and get him to advise you; and let us all hope and pray that we may soon have a *postal savings bank* such as has been so much talked about.

In my last Home talk I spoke about our American flag and what it represents. Now, this American flag ought also to represent a place where every man, woman, and child who lives under and devoutly believes in that flag, can place his honest earnings, and where no power on earth can wrest it from him. This *can* be done, and it is a burning shame that it has not been done already. In old times the dear Savior reminded us of the folly of laying up treasures on earth where

thieves break through and steal. Now, with all the other wonderful things that have come true in our civilization, it seems to me it is high time for our government to provide a place for these little savings, where the rewards of toil can be put where thieves do *not* break through and steal. The government can easily do it.

A good woman, a friend of mine for more than forty years, said to me just a few days ago that there is no one thing so much needed in the United States as a safe place for the earnings of America's children. It is a great comfort to me to know that there are those in my employ who have worked for me or for our institution, if you choose, for more than forty years; and these old friends of mine have long been in the habit of entrusting me with their surplus earnings. I mentally thank God that I can honestly say, each and every one of them has always had his earnings when he called for them. Well, this particular friend of mine was, years ago, persuaded to take some of her money away from me and loan it to another party—to a minister and his wife who wanted it; and I am afraid they suggested that it was not quite as safe with A. I. Root (with his craze for developing the Home of the Honey-bees) as it would be in *their* care, and so she let them have it. This man was a minister of the gospel, but he was in other business also. By the way, I have long had a sort of feeling that ministers of the gospel ought not to be very much engaged in other kinds of business or occupation. Of course, the pastor of a church wants some kind of recreation. I would by all means let him have some chickens, a garden, and a few hives of bees; but these things should be only secondary or a side issue. One who accepts and assumes the sacred calling of one of God's ministering servants, to lift his fellow-men out of darkness into light, ought to give all his energies and strength to that one thing. I do not believe in being half preacher and half lawyer or bee-keeper or any thing else. Well, this minister of the gospel died soon after this, and his financial affairs were in a very bad condition, his estate paying only a few cents on the dollar. His life was insured for a goodly sum; but I think that none of that money was used to pay back the poor hard-working girl whom he and his wife had induced to take her scanty earnings from a safe place, and give them into their care and keeping.

Now do not get an idea, dear friends, that I am boasting. As I look back I realize that there have been several times in my life when, had I died suddenly, it would have been a hard matter to pay every one every cent that was his due. And this brings me to the special point of this Home paper. Every one of us, especially those who profess to believe in the Lord Jesus Christ, should have his affairs in such shape that his wife or friends can readily satisfy every claim, if he should be called away suddenly by accident or otherwise. At one time during the past winter one of the younger members of our firm gave me notice when I was down in Florida that we had purchased more beeswax and basswood than we ever had before. As both of these commodities would surely be wanted, they felt as if The A. I. Root Co. ought to be prepared, as we always had been before, to take at a fair price whatever was offered. Of course, we have had to

borrow at certain seasons to do this. I asked the question how much money we had borrowed to invest in these things, and what the basswood and beeswax were worth that we had in stock. The reply came that the wax and lumber carefully stowed away and fully insured amounted to more than the borrowed money; and I said, "Keep on taking what comes in through the regular channels of trade, but do not solicit any further shipments."

But a careful and substantial business firm should proceed rather cautiously in matters of this kind; for even beeswax and lumber may take a sudden drop in value; and this drop in value may make trouble. What I started out to say was that no follower of the Lord Jesus Christ should ever deliberately go into any deal or speculation that may render it impossible for him to hand over what is due at any time it may be wanted. Of course, special arrangements are often made that the money is not to be called for before a specified time; but every professing Christian should be very careful about getting into any sort of predicament, by accident or otherwise, whereby he absolutely *can not* do all that he agrees to do. The government could handle and care for the money belonging to working-people more surely than could any one single person. The best and most upright men are likely to die at any time; and, despite all precautions that can be taken, so far as I know there is no positive assurance that the children or others who take charge of the business after one's death will manage it as it was before. Unforeseen things are likely to occur. We can insure our property and our lives; but even insurance companies sometimes become bankrupt. People who fail in business often have comfortable homes that the law can not touch; but occasionally we see instances where the man who fails gives up his last copper to satisfy his creditors; and I hope that God will give me grace enough to give up my last copper and go to the poorhouse (if need be) rather than to feel that I had kept back one single cent of the honest earnings of any hard-working business man or woman.

There have been many warnings recently in the *Rural New-Yorker* and other periodicals against investing money in the various schemes and stock companies that are advertised. With the good prices that we have for all sorts of rural products—poultry, fruit, etc.—there seems to be an unusual number of people who have a little spare money to invest. But the *Rural's* advice, which I heartily second, is, do not invest your money in any of these institutions that urge you in papers to invest. And especially beware of those who tell you they can pay you a much larger interest than you can get around home. I am well aware that even our religious periodicals are giving place to such advertisements. I read one such only a few days ago, declaring that money invested with them would bring *14 per cent* sure. Have nothing to do with any such offers. I would almost advise that you stop having any paper come into your home that contains advertisements of that kind. Any honest person or institution that wants money can usually get it for 6 or 8 per cent. Of course, it makes some difference where only a small amount is wanted for a short time. Our savings banks usually pay

4 to 5 per cent; and you have a right to be suspicious of anybody who wants your money and agrees to pay you much more than the regular legal rate.

In the fore part of this paper I spoke of highway robbers; and in our large cities we have pick-pockets who seem to have as little scruple in robbing women or a poor hard-working girl, perhaps a schoolma'am, as they would in robbing a man; and the writer of the letter that I have given is doubtless well aware that there are men and rascals who will resort to any hook or crook to get their hard earnings if they can find any way to do so. And let me say once more in closing, there is no one thing that is so much needed just now in this land of ours as some safe place provided by the government where every wage-earner can easily and quickly deposit his savings, and then just as easily and quickly get them back again when wanted. Let us work and pray for the speedy consummation of a postal savings bank.

### "TO HIM THAT OVERCOMETH."

*Brother A. J. Root:*—You will kindly indulge me in a degree of familiarity in addressing you, for in the years that I have had the pleasure of reading the productions of your pencil you have come to be more than a friend to me though you know it not.

In your article for July 15, *Homes* department, I was not a little interested in your relation of experience with the mother hen—namely, the croppings of our own fallen nature not yet fully overcome. "To him that overcometh will I grant to sit with me in my throne, even as I also overcame and am set down with my Father on his throne."—Rev. 3:21."

The thought was so grand that I could not refrain from penciling it right now. The lesson from that faithful mother hen was that my well-beloved brother had not yet quite overcome the fallen nature in his conflict with one of the smallest and most harmless creatures that God had created.

Now, this is no indication that he is not one of God's chosen, for he is—only he had not yet fully overcome. To have completely overcome is one of the most glorious achievements of a redeemed soul. Try it, my brother; just let go and sweetly rest in the arms of Jesus, and then you can smile at Satan's rage or even the mother biddy that was so true to her own mother instinct formed within her by our own common Creator.

Now, if I were to want a mother chicken I would give much for this one, or a setting of her eggs, for she certainly is of royal blood.

Now, my brother, I know I am no better than you, nor do I believe I am half as good; but to me it appears I could not but have caressed that little princess of a hen and greatly admired her; further, have cozily wrapped her within a sack or something else until I could have gathered her little group into her retreat, and then set her at liberty. But enough of what I would have done. Do you know the teachings of our Savior about love and mercy are as applicable on our part to the lower animals, since there is no appeal from our arbitrary rule over them, and therefore that, when any of the animals rebel against us, they can not understand God's law of love except by our example—"When thou art reviled, revile not again?" Therefore, because of our knowledge of this law and of their ignorance it is binding on us and not on them.

I once saw an example which I shall never forget. I was traveling in Iowa by private conveyance, and stopped over night with a well-to-do farmer. Every thing was in good style and on a rather large scale. Early in the morning I was up to visit with him his estate. We went directly to a large barnyard. In this yard were all the domestic animals, it appeared to me, that I had ever seen in my life, and, stranger yet, they all huddled together, or were not separated, and yet were quiet and showed a spirit of kindness that was universal with all. But the best of all the show was when the owner opened the gate and entered their midst. It was an apparent signal for a "love-feast," especially by each animal toward its owner. The horses and young colts, the cows and younger cattle, the pigs and sheep and poultry of every description—turkeys, geese, ducks, and chickens vied with each other in getting within reach of him, or in licking his hand or in hearing his kind voice of love. He moved as quietly and carefully as possible so as not to step on any poultry which were young. As he proceeded to feed and care for them he was especially easy to notice the trust and love between some of the colts or horses that excelled, apparently, a passing circus.

Now, if mankind were all filled with this spirit to the exclusion of any others, what a change, since, by nature, especially

among the domestic animals, this spirit of trust and obedience is universal! for God has so created them. If man, instead of his fallen nature, could thus be filled with the spirit of our meek and lowly Savior, how many vicious horses would we have?

I had a favorite horse from her colthood, that was not of the mildest disposition; but with me all through its life it is as gentle and kind as a lamb. In my absence for a few days she becomes imbued with the spirit of her driver.

Had I not known you so intimately as it appears to me I do in reading every word of our *Homes* I would not impose on you by writing these lines; but remember that two months ago I had the misfortune to have one of my legs so badly broken that I shall probably never walk again except with crutches, and especially as my fourscore years are already numbered, and my general health is also poor from indigestion; so you see I am several years your senior. This is my apology for being so tedi in addressing you, besides my desire for congenial companionship. While here in bed on my back I can write with my pencil, for I can not stand nor sit at my desk.

Let I forget it, I wish to say that, a few moments ago, my eye caught in our daily paper an item or two which I clipped and will insert with this letter. I know you are acquainted with our Dr. Chapman, who is always so successful in all of the good works he undertakes. We fondly hope he will succeed in this also. The race-track is only about one mile from our home here in Monrovia.

I have often wished I might have met you in our boyhood, for I believe we were near neighbors in those days. My birthplace was at Chagrin Falls, in 1830, although I have lived in Portage and Geauga counties. I was a successful bee-keeper in my boyhood in Bainbridge; but for only a brief time. My success always followed me in after years.

I want to tell you of a most wonderful pullet I had at my home in my boyhood days. It was of a wild disposition, making her nest far away in the forest. She would hatch every egg, and bring the chicks home when of quite good size. At home, however, she was as tame as the others. One of her most wonderful exploits (which I saw) was her hot pursuit of a hawk that had one of her chicks. She was in close pursuit on the wing, high in the heavens, still pursuing when I lost sight of her and the hawk. Like yours she was a "princess," and by me highly respected.

P. G. CARTER.

Monrovia, Cal., July 22.

Many thanks, dear brother, for pointing out to me that beautiful and inspiring text from the book of Revelation. Why, it fairly made my heart bound when your letter called my attention to that wonderful promise. Yes, it is indeed true that, when we exercise self-control and overcome a disposition of anger or impatience which we happen to have toward even the dumb brutes, we are preparing ourselves to sit down eventually with the great Father in his throne. It seems almost too much to believe; but, dear friend, I think you have got it, all right. It is a long slow voyage that we are making in that trip from earth to heaven; and the hills we have to climb up, perhaps slowly and painfully, are right along in the line of *overcoming*, as you describe it. And this reminds me that I have had *still another* experience with that sitting hen. I am not quite ready yet to call her "princess," just as you do; but perhaps you are right about it.

Let me explain that I have had wonderful success this summer in setting hens. Three, to which were given thirteen eggs each, brought out twelve chickens each, and they all have twelve apiece yet. Well, when the last one came off I let her go off into the wet grass one morning when they were only about three days old. She came back with only eleven. I started off to where she had been, with a feeling something like that expressed in that old hymn entitled "The Ninety and Nine." But I had to give it up till I remembered that a little further, in that particular direction, there was that same "fighting mother" with her half-grown chicks; and, sure enough, I found that her clucking had misled my one "lost sheep." I found him on a little rise of ground, chirping for his mother as loudly as his little lungs would permit. Now, please

note that this "princess," as you call her, would not own him, nor have any thing to do with him; neither would he follow her nor have any thing to do with her; but when I hurried to pick him up and carry him back to the "ninety and nine," to his own mother, this *princess* took it into her head that *she* was called on to interfere. She flew up in my face, and scratched my hands again until I actually forgot my Home paper and your wonderful text. Yes, I forgot it all for just a little time. I think that, very likely, under the smarting of her claws, I said, "Look here, old lady, this chicken is not yours, and you would not have any thing to do with it when I came around, and you *know* it. If I get hold of you this time you will *remember* it—see if you don't." To tell the truth, I was actually grabbing after her while she was viciously scratching, before I remembered about the Home paper and "overcoming." I did not succeed in getting hold of her, as she was too spry. But I felt guilty, and greatly ashamed of myself to think she had once more stirred up angry feelings. Dear brother, I am afraid it will be a *long time* yet before I can just "let go," as you express it, and "smile at Satan's" efforts. Yes, I know what a Christlike spirit we ought to show to the domestic animals; and I know, too, that it would pay *big in dollars and cents*. The man who gets mad at a sitting hen never ought to succeed with poultry.

When I looked at that newspaper clipping you sent, telling about Dr. Chapman, who defied the millionaire gamblers, and completely routed them, I was wondering if it could be the Dr. Chapman who is the author of the *Stainless Flag*; but his picture in that same newspaper clipping verifies it. May God be praised that our aged brother, "Father Eloquent," as they call him, in his advanced years is able to take up and carry out so many different lines of reform work.

Friend C., why in the world did *you* not raise a lot of chickens from that wonderful pullet? That is just what I did down in Florida; and what I am doing now is to test thoroughly the two cockerels that I am going to take with me to Florida next November. One of these is father of all of these broods of chickens where I am getting twelve chicks right along from only thirteen eggs, and the *whole* thirteen from *one* mother.

## HEALTH NOTES

### "THE BOOK OF WHEAT."

Well, we have now got a book of almost 400 pages, all about wheat and nothing else. It is wheat from beginning to end. The pictures (and there are hundreds of them) are all about wheat or something to do with it. Even if Abraham Adams did swindle a good lot of us with his story about that one head of wheat away off in Alaska he has probably done us some good by turning the attention of the whole wide world in the direction of new and different kinds of wheat in a way it has never been done before. Well, I am greatly interested in wheat just now—much more than ever before. This book, on p. 286, says, "Bread is the oldest and most important product made from wheat. It supports life bet-

ter than any other single food except milk, and it is the most staple food of modern civilization."

Now, that hits me, because I am eating wheat more than any thing else, morning, noon, and night. But I do not wait to have it made into bread; and the next thing to wheat for my daily *menu* is milk, mentioned in the above quotation. Only two hours ago I said to Mrs. Root, "Why, Sue, you did not tell me when dinner was ready."

"Well, my dear husband, the way you are living nowadays, dinner is *always* ready; and if you happen to be busy, and do not come exactly on time, it does not matter, for your dinner never gets cold."

Now, there are several lessons in the above little incident. It *is* true my dinner never gets cold, and I do not know but Mrs. Root is feeling a little bit lost because she does not have to get breakfast, dinner, and supper for her husband three times a day, as she has done all her life. And another important truth comes in right here: I do not get faint, famished, and used up, as I used to do, and tempted to feel cross if dinner is not ready just on the minute. I must confess to being incredulous, as Terry has expressed it, that so small an amount of food should give so much strength.

Perhaps I should explain that wheat is not the only grain I use. I have the shredded biscuit I mentioned; then I have puffed rice, and, for variety, grape nuts—another preparation of grain. And besides the milk I have an egg in the morning. But my principal diet day after day is wheat, and this is why I am interested in this wheat book. The book is by Peter T. Dondlinger, Ph.D., Professor of Political and Social Science in Yale University.

The government at Washington has tested more than a thousand varieties of wheat; and our Ohio Experiment Station, Wooster, tests every year between 100 and 200 varieties. Besides these tests of new varieties of grain there have been ever so many tests of different fertilizers now on the market for growing wheat. I find by this new book that the Miracle or Alaska wheat has been known and tested repeatedly for years past. It belongs to a particular class. It is mostly used for making macaroni and other pastes. Where it is mixed with other flours it is sold largely in French markets.

A single grain of wheat can be made to produce 300 grains in a year. In ten years, one grain of wheat in North Dakota actually produced 300,000 bushels. A thousand acres of land at South Walla Walla, Washington, yielded 51,000 bushels in 1881. This yield was carefully measured, and reported to the Department of Agriculture, Washington, where they said it was the largest yield for 1000 acres ever reported.

This book considers wheat-growing, not only in the great wheat regions of the North, but on almost every spot on earth. It tells us all about insect enemies, and discusses the market, and has a long chapter and a tremendous protest against gambling in wheat. It has also considerable to say in regard to "ready-to-eat" wheat foods, including shredded-wheat biscuit, granose flakes, and the breakfast-food industry, started at Battle Creek, Michigan, and also something about grape nuts. Why, even a hasty perusal of the

book has given me the fever, even in my old age, to try my hand once more on wheat-growing.

The book is published by The O. Judd Co., New York; price \$2.00. It can be mailed from this office.

SHREDDED-WHEAT BISCUIT, GRAPE NUTS, AND OTHER SIMILAR "READY-TO-EAT" CEREALS.

While I am on this subject of wheat, let me add the following, as an illustration of the magnitude of the manufacture of "ready to eat" wheat foods:

This book tells us that the plant where shredded wheat is manufactured at Niagara Falls covers  $5\frac{1}{2}$  acres; and the total cost of the buildings and equipment was something like two millions of dollars. Again, the capital employed by the Postum Cereal Co. is five millions. The expenditure for advertising is one million dollars a year. Now, I am fully satisfied that the introduction of these cereal foods has been a blessing to humanity; but at the same time there would, no doubt, be a great saving in money if the farmer who grows the wheat could put this same wheat right on his table, thus saving the expense of the "middleman," passing it through a factory, and asking the consumer to pay for a decorated pasteboard package. All that is necessary to make the wheat ready for the table is to clean it from all trash, and then crush it by means of rollers or something else so it may be masticated as readily as the Pettijohn rolled wheat which we find at the groceries. Perhaps a majority of mankind will still prefer to buy it as it is needed, at the nearest corner grocery, even though we do pay somebody a pretty large profit for doing the work for us.

## POULTRY DEPARTMENT

"PROGRESSIVE POULTRY CULTURE;" SOMETHING ABOUT POULTRY-BOOKS IN GENERAL.

On page 1179 Prof. Cook gives this book an excellent write-up; and while I agree, after a careful perusal, that it is one of the best poultry-books we have, *so far as it goes*, I hope both the author and my good friend Cook will excuse me for giving it as my opinion that the book is *not* strictly up to date. It is a scholarly work, and the statements are all true; but it is of the "sin of omission" that I wish to complain. Now, my criticism of this book will apply to a great number of other poultry-books. The author, like Prof. Cook himself, has evidently not been reading our poultry-journals and keeping in touch with the great improvements and new inventions that have been going on. Yes, some of these inventions are not new and true, but neither new *nor* true, I admit; but still our up-to-date poultry-books should discuss them and help us to sift the wheat from the chaff. In the first place, I could not find any mention of the trap nest; of Hogan's \$10.00 secret or the Potter \$1.00 secret. I do not find any thing about hens that lay from 200 to 300 eggs a year. These secrets are advertised in the poultry-journals all over the world; and

hard-working people are paying out their hard-earned money for them — yes, and even after the so-called secrets have been published and given to the world — see GLEANINGS for Jan. 1, p. 43. Our poultry-journals may be excused in some degree for keeping silent in regard to this matter, because of the advertising they get so long as they do not expose the frauds; but not so with a book. I find also no mention of sprouted oats, and yet the journals all over our land are still advertising the \$5.00 book that contains a secret for making the very best poultry feed for ten cents a bushel. Our Ohio experiment station, as you may remember, have agreed to test this matter, and see if one bushel of oats really will, when sprouted, go as far as four bushels fed dry. Why does not this book or other books tell us the truth about a matter like this? The author of this \$5.00 book claims he has sold several thousand copies, and his customers are *all satisfied*. Neither do I find the matter considered of germless eggs, as recently mentioned in this journal and the *Rural New-Yorker*.<sup>\*</sup> A very brief mention is made of "curtain-front houses," "day-old chicks," and "hopper feeding." But there is no picture given of an up-to-date hopper arranged so the poultry will not waste the feed and keep out rats and mice,<sup>†</sup> etc., and no recognition of the large establishments that are now shipping day-old chicks successfully by the *hundred thousand* and sending them hundreds of miles. Nor is a word said about the "fireless brooder," as now advertised by several establishments; and yet I am fully satisfied that there is no need of a lamp, or of artificial heat of any kind, for a brooder, either in California or Florida; and some claim that no artificial heat is needed here in Ohio, especially where one has forty or fifty chicks or more to keep up the animal heat.

I know by experience that it is a great task to review even hastily the principal poultry-journals now published in the United States; but a man who writes a poultry-book surely ought to take the time to do it if he wants his book to give a glimpse of what is now going on in the poultry world. I am glad to say the book is beautifully bound, and well printed on nice paper; and I do not find a single statement in it, from beginning to end, that I should consider erroneous or misleading. We can mail the book from this office.

<sup>\*</sup> We are told by the *Farmer's Guide* that the Geneva Experiment Station publishes a bulletin in regard to careful experiments in keeping the males from the laying pullets. Below is a brief extract summing up the results:

"A pen of pullets, kept without a male, produced eggs at about 30 per cent less cost than an exactly similar pen with which a cockerel was kept. Another pen without a male gave during the first three months about the same proportionate excess of product over an exactly similar pen with which a cockerel was kept. \*\* In each of the two pens without male birds some pullets had begun to lay from one to two months earlier than any in the corresponding pens in which male birds were kept."

If the above is true, farmers and other poultry-keepers throughout our land are losing large sums of money by letting useless males run at large. Not only better eggs, but ever so many more of them, can be secured by promptly disposing of these surplus males; and yet how many poultry-books even mention this exceedingly important matter!

<sup>†</sup> Friend Cook mentions the excellent index. In that index we read, "Feed-hoppers, 208." On turning to that page I find the following: "Feed-hoppers of metal or wood may be hung against the wall of the room." No picture of an up-to-date feed-hopper in the whole book, and no other mention of how feed-hoppers should be constructed, do I find.

## THE BEST POULTRY-BOOK AND POULTRY-JOURNAL.

While I am on this subject, the following comes to hand:

*The A. I. Root Co.*.—What is the best book on poultry-raising? and which is the best poultry-journal? Ask A. I. Root how he keeps the red mites out of his hen-house.

Walton, N. Y.

H. C. MCKENZIE.

Friend M., although I have a small library of poultry-books, and nearly all the poultry-journals coming every day, I can not answer your question definitely. There is no book that I know of, or poultry-journal either, that makes it a business of exposing the frauds that are advertised in almost every poultry-journal published. I am pained and shamed to say this. Our agricultural periodicals in their poultry departments are telling people what to buy and what not to buy; but the poultry-journals, almost without exception, advertise every thing, and in their reading-notices recommend every thing that their advertisers offer. If I am doing some journal wrong, will some good friend set me right?

In regard to red mites, they have not been on my fowls, and I have never seen any, either in Florida or here in Ohio; but for fear they might come I have just had my new scratching-house painted inside and out with carbolineum; and this was done before putting on the outside building-paper. I did this because both the *Rural New-Yorker* and the *Country Gentleman* recommended it to keep vermin out of the house. Prevention is better than cure, you know. This substance is also a preservative of wood, and it is doubtless worth all it costs, aside from keeping out insects and rats and mice. Below is what one of the friends says of it:

I see one man asks how to keep mice and rats away from hoppers. Have them write to Carbolineum Wood-preserving Co., 349 West Broadway, New York, and get Bulletin 26. All they have to do is to paint the hopper and the vermin will stay away. It will kill hen-lice, and one painting will last for two or three years. It is fine to keep away ants as well as many other things. Chatham, N. Y., Sept. 7.

P. L. CALLENDER.

## STILL ONE MORE "WONDERFUL SECRET."

We copy the following from the advertising department of the *Poultry Review*:

MY DISCOVERY OF A PRINCIPLE REGARDING BROODING CONDITIONS WILL ENABLE YOU

1. To convert something which you are now throwing away, and getting absolutely no benefit from, into profit. How can you stop this waste if you don't know about it?
2. Make a brooder, without any cash outlay, and with only about one-half hour of your time. Isn't it worth investigating?
3. Produce results which can never be approached in the number and quality of chicks raised by any other method. Is this not very desirable?
4. Raise them with less heat, time, space, labor, feed, money, and worry. Why not "get next" to this?

IT IS NEW, ECONOMICAL, LUCRATIVE, AND PRACTICAL.  
WHAT IT IS NOT.

It is not merely a slight variation from the principles used in other brooders, nor is it a different method of applying the same principles used in other brooders. Neither is it a "fireless brooder."

WHAT IS IT?

It is a principle very simple yet wonderful in its results. This principle is a radical departure from that employed in any other brooder. It is a principle which was never before thought of or used in brooder construction.

I am asking only 50 cents for this discovery, which is a very small fraction of its actual value to you. In view of the above facts, it is folly for you to be without this great boon to the poultry-raiser; in fact, BUSINESS ECONOMY demands that you know it. This is YOUR OPPORTUNITY. Grasp it NOW. I have no fixtures to sell. Address

STANLEY SMITH, Bloomington, Indiana.

Most of our readers probably know that I have been wasting money and throwing it away for

years back in trying to get something really valuable that has been advertised to be sold as a secret. I commenced first by buying recipes for making artificial honey, and then I got a mania, as you may know, for investing in all kinds of secrets, from 25 cents up to \$10.00; but so far as I can recollect just now I have never yet succeeded in getting any thing new and valuable; but each new advertisement like the above, for instance, inspires me with new hope. I am of a hopeful disposition, you know; and, besides, I am just now greatly interested in all sorts of brooders. Please notice the above advertisement says, "It is a principle never before thought of or used in brooder construction."

Here is what I got for my 50 cents—a very poorly printed pamphlet containing three pages, and no illustrations whatever; and after reading it many times over I could not construct such a brooder as he tries to describe for the life of me. His "discovery," when boiled down, amounts to this: When you make a brooder to be heated by a lamp, instead of carefully carrying off the fumes from the kerosene-lamp just carry the fumes, heat and all, right on the chickens. It not only will not hurt them, but it will do them good. The carbon dioxide, a product of combustion, is just what the chickens need. This is what Mr. Stanley Smith has discovered—that is, he *claims* it is his discovery. But in the proceedings of the Poultry Institute, of Ontario, Canada, held last February, there is quite a chapter on this carbon-dioxide business, and I quote from page 9 of the bulletin as follows:

Lamp-fumes were applied to one machine in this way: We set two machines, side by side, and from the lamp of one we led a tube right into the egg-chamber of the other so that all the fumes that were formed from the first machine were passed into the egg-chamber of the second machine, and we got a great deal of carbon dioxide in that way.

This bulletin tells us that they got better results when the fumes of the lamp are run directly into the incubator. They were induced to try this because they found that a sitting hen gives off from her body a considerable quantity of carbon dioxide. On page 11 we quote again:

A MEMBER.—Is carbon dioxide that comes from the fumes of a lamp the same as comes from the hen?

PROF. HAKCOURT.—There can be only one kind of pure carbon dioxide. It is all the same.

Furthermore, home-made brooders have been warmed by kerosene-lamps for years past, by hundreds of people; and to my knowledge a good many have warmed up the chicks by letting the top of the lamp chimney go right in among them. In fact, I sent 50 cents some time ago for directions for making a home-made brooder; but I never made any use of it because I did not like the idea of warming the chicks directly with the products of combustion. Experiments in Ontario, however, as well as those of Mr. Smith, would indicate that we need not take the precaution to get rid of the fumes from the lamp, either for an incubator or a brooder; but so far as I am concerned I think I prefer the fireless brooder without any lamp at all, especially in a warm climate or at a season of the year when we are not having cold weather.

GLEANINGS is a very valuable paper in all respects. The first I read of every number is the Temperance matter, Our Homes, and then about bees, honey, etc. God bless our old friend Root.

Tacoma, Wash., Sept. 8.

E. O. TEFFRE.

# QUEENS

And nothing but Italians. An improved superior strain is what QUIRIN-THE-QUEEN-BREEDER raises. Stock is Northern-bred and hardy—not a single colony lost during the past winter; have five yards, all wintered on summer stands. Am now taking off supers of nice white-capped clover honey. Prices of bees and queens as per below:

| Prices of Queens after July 1.        | 1     | 6      | 12      |
|---------------------------------------|-------|--------|---------|
| Select queens . . . . .               | \$ 75 | \$4 00 | \$ 7 00 |
| Tested queens . . . . .               | 1 00  | 5 00   | 9 00    |
| Select tested queens . . . . .        | 1 50  | 8 00   | 15 00   |
| Breeders . . . . .                    | 3 00  | 15 00  |         |
| Straight five-band breeders . . . . . | 5 00  |        |         |

All queens now go by return mail Safe arrival and pure mating guaranteed. We employ 400 to 500 swarms. Can furnish bees on L. or Danz. frames. Add price of whatever queen is wanted to nuclei or colony. No order too large, and none too small. Over 20 years a queen-breeder. Address all orders to

**Hurry in your orders as this is the last time this ad. will appear for this season.**

QUIRIN THE-QUEEN-BREEDER, Bellevue, Ohio.

## 5000 QUEENS

of the famous 3-banded LONG TONGUE RED-CLOVER STRAIN OF ITALIAN BEES—what I want to sell this season

My bees GATHER HONEY if there is any to get; ARE LITTLE inclined to swarm and sting; they please such people as The A. I. Root Co. R. F. Holtermann, W. Z. Hutchinson, Morley Pettit etc., and if they don't please you send in your kick.

Queens of all grades now ready

|                        | 1                | 6      | 12     |
|------------------------|------------------|--------|--------|
| Untested queens        | \$1 00           | \$5 00 | \$9 00 |
| Select untested queens | 1 25             | 6 00   | 11 00  |
| Tested queens          | 1 50             | 8 00   | 15 00  |
| Select tested queens   | 2 00             | 11 00  | 20 00  |
| Breeders               | \$5 00 to \$7 00 |        |        |

W. O. VICTOR (Queen Specialist), Hondo, Tex.

## 25 PER CENT REDUCTION.

Here is your chance to save money on a great lot of the best queens cheap.

Introduce LAW'S queens this fall and thus insure a full crop of honey the coming season. LAW'S queens are sent everywhere, and everywhere there are words of praise for them.

One firm alone has bought over three thousand of the LAW'S queens during the past three seasons.

Reduce 25 percent from the full winter prices; remit the balance, and your order will have prompt attention.

Single queen, \$1.00; six for \$5.00; dozen for \$12.50

W. H. LAWS, Beeville, Bee Co., Texas

## Long tongued Red-clover Queens

Bred by their Originator

Do you want to get some specimen queens of the world-famous red-clover stock of Italian bees? Then buy from me, because I am the originator, and surely ought to know how to breed them in their purity. When you get them from me you know you have the real strain. For years I have devoted time and skill to this stock, trying to reach perfection. I can submit many splendid testimonials in favor of this stock to show my work has not been in vain. Try them, and YOU will be pleased also. I endeavor to please the practical man looking for definite results in dollars and cents. Many years' experience as head apiarist of The A. I. Root Co. enables me to fill the most exacting order with complete satisfaction to the purchaser. Let me show you how well I can please you.

|                                  | Prices             | 1      | 6       |
|----------------------------------|--------------------|--------|---------|
| Untested queen . . . . .         | Before October 30, | \$1 00 | \$ 5 00 |
| Select untested queen . . . . .  | "                  | 1 25   | 6 00    |

**F. J. Wardell**  
Uhrichsville, Ohio, U. S. A.

## NOW IS THE TIME

to buy your queens for fall increase. I can mail promptly young vigorous queens—Italian, Carniolan, Banat, and golden. Prices, untested, 75 cts.; \$8.00 per dozen; tested, \$1.25 each; \$12.00 per dozen.

Circular free.

Grant Anderson, S. binal, Tex.

## QUEENS of MOORE'S STRAIN OF ITALIANS

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardiness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the *Bee-keepers' Review*, Flint, Mich., says, "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, 75 cts. each; six, \$4.00; doz., \$7.50. Select untested \$1.00 each; six, \$5.00; doz., \$9.00.

I mail orders by return mail.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

J. P. Moore, queen-breeder, Rt. 1, Morgan, Ky.

Fob 5 inches long, shield 1 1/2 inches square

## Watch Fob Free

YOUR CHOICE OF CANDIDATES  
**BRYAN OR TAFT**

Handsome Campaign Badge you have ever seen. You may have it FREE with our compliments. This fob is made of a fine grade of seal grained Russia leather, nickel-plated buckle, beautiful mother-of-pearl shield, containing a photo of your favorite candidate, either Bryan or Taft. It is guaranteed to be just as we describe it and you will be proud to wear it. We are giving away these handsome fobs to get acquainted with you and to get you acquainted with our splendid and instructive farm paper, "FARM AND STOCK," an up-to-date magazine devoted mainly to corn and live stock. We will also send you our liberal proposition whereby you can secure other handsome premiums free by giving away several of these fobs to your neighbors. You are sure to be delighted with both fob and paper, so send 10c at once while they last to

**FARM AND STOCK**

Box 307, St. Joseph, Missouri

## FASHION BOOK FREE!

I want to send you my handsome new book showing hundreds of latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for five cts. each. They are the same patterns you have always paid 10c & 15c for at the stores, made by the same people, and correct in every detail.

### HOW I DO IT.

I publish the **FARMER'S CALL**, a weekly paper for every member of the family. An especially interesting feature each week are the children's letters; and the Woman's Department is unusually strong and instructive. Among the special features for Women folks, is its fashions in which I show the **5c patterns**. Let me help you to save money.

### MY SPECIAL OFFER

Send me 5c and I will send you the **Farmer's Call** every week (over 1000 pages) for one year and will send my big Fashion Book to you free. I also agree to sell you any pattern you want thereafter for 5c. I can sell them for 5 cts because I buy them by the thousand and don't make any profit. I don't want the profit. I want your subscription to the **FARMER'S CALL**. You will save many times the cost of my offer in a year. **WRITE TO-DAY!**  
**JOHN M. STAHL, Dept. G, QUINCY, ILL**

## Shipping-cases

for any number or size of sections desired. These cases are made of fine white basswood, and the workmanship is first class. Owing to the shortage in the honey crop last year we have a good stock on hand and can make immediate shipment.

Twelve-inch case, with follower, to hold 24; or eight-inch case, with follower, to hold twelve beeway sections. shipped when no size is mentioned. All cases single tier unless otherwise ordered.

### Honey-packages in Tin.

Standard packages for storing and shipping extracted honey. Less chance for leakage or taint from wood; being square they economize space. Five-gallon cans boxed two or one in a box; gallon cans 10, 1/2-gallon cans 12 to box. Five, one, or 1/2 gallon cans not boxed if desired. Prices on application for any quantity.

Place your order now; prices and prompt shipment guaranteed.

### Honey and Wax for Sale

**FOR SALE.**—To reduce stock I offer for sale as follows: 26 cases of stock No. 40, and 40 cases of stock No. 44 at \$10.80 per case of two 60-lb. (new) cans. This is a raspberry-basswood blend, and is the cream of two apiaries; being extracted from select all-sealed upper stories. A third of a century's experience in the production of fine extracted honey. Ask for my little circular "A Word about Extracted Honey;" this will explain why it pays to buy this delicious stock.

E. D. TOWNSEND, Remus, Mich.

**FOR SALE.**—150 cases of No. 1 comb honey, 15 sections in 3-inch glass, no-drip cases, 6 cases in a crate, very fine, at \$2.00 per case, f. o. b. cars here. Also 8000 lbs. clover and basswood extracted, in new 60-lb. cans, 2 in case, very heavy body and fine flavor, at 8c, f. o. b. cars here. Sample free. Also extracted in 1-lb. Simplex jars, at \$2.00 per dozen.

W. H. TOWNSEND, Hubbardston, Mich.

**FOR SALE.**—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 9 c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order.

LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

**PURE RASPBERRY HONEY**, unmixed with other honeys, has a decided raspberry flavor that is simply delicious—one that must be enjoyed to be appreciated. If you never tasted raspberry honey, send me ten cents and I'll mail you a generous sample, and the ten cents may apply on the first order you send me. For further particulars, see large advertisement on page 1167.

W. Z. HUTCHINSON, Flint, Mich.

**FOR SALE.**—New crop of fancy white-clover extracted honey, thoroughly ripened on the hives before extracting. None of better quality on the market. Put up in barrels, new 60-lb. tin cans, and smaller packages if desired. For prices, etc., address

EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

**FOR SALE.**—Aug. 16 we finished taking off our clover, basswood, and button-willow honey. It is principally clover, fine and rich. Delivered at station in 60-lb. square cans, two cans to case; 8½ cts. per lb. Reference, our postmaster or agent, Lakeville, St. Joseph Co., Ind., at which place address C. A. BUNCH.

**FOR SALE.**—Write for prices on clover, basswood, and buckwheat honey in 60-lb. cans and kegs; also comb honey and beeswax, all guaranteed to be pure.

W. L. COGGSHALL, Groton, N. Y.

**FOR SALE.**—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.

J. P. MOORE, Queen-breeder, Morgan Ky.

**FOR SALE.**—1908 crop of white-clover honey—a strictly fancy table honey, extracted from capped combs. If you want good honey, here it is, put up in new 60-lb. cans, square or round. Sample free.

WARREN H. WINCH, Hopkinton, Iowa.

**FOR SALE.**—5 tons of fine-quality comb and extracted. State amount you wish, and we will quote you our lowest cash price.

QUIRIN-DE-QUEEN-BREEDER, Bellevue, O.

**FOR SALE.**—Choice white extracted honey, mostly clover and raspberry mixed, in new 60-lb. cans. Price on application. Sample, 10 cts.

JAMES McNEILL, Hudson, N. Y.

**FOR SALE.**—Honey, clover, or buckwheat, comb or extracted. Write for price. Sample of clover extracted free. State quantity and quality desired.

C. B. HOWARD, Romulus, N. Y.

**FOR SALE.**—Basswood extracted honey, left on the hives until thoroughly ripe. One box of two 60-lb. cans, \$9.60.

GUSTAVE GROSS, Lake Mills, Wis.

**FOR SALE.**—8 tons of raspberry and basswood extracted honey, thick and very fine flavor, in new 60-lb. cans, 2 in case, at 7½ cts., f. o. b. cars here.

J. N. HARRIS, Mancelona, Mich.

**FOR SALE.**—Fancy clover and also buckwheat extracted honey in new cans, two in a case. Send 10 cts. for sample, which may be deducted from first order. EARL RULISON, Rt. 1, Amsterdam, N. Y.

Extra quality clover honey in N. B. K. A. round cans, 9c; buckwheat, 7c. Satisfaction guaranteed.

**FOR SALE.**—Fancy and No. 1 white-clover comb honey.

ANTON G. ANDERSON, Holden, Mo.

### Honey and Wax Wanted

**WANTED.**—25 tons of fancy comb honey. Write, stating particulars, to C. M. CHURCH, New Kensington, Pa.

Will pay 7c per lb. for gilt-edged white clover, raspberry, or basswood honey, in new 60-lb. cans f. o. b. here; Chicago suburb.

B. WALKER, Clyde, Cook Co., Ill.

**WANTED.**—Comb, extracted honey, and beeswax. State price, kind, and quantity.

R. A. BURNETT, 199 South Water Street, Chicago, Ill.

Mail small sample, giving quantity you have, how put up, and lowest cash price you will take for it.

E. R. PAHL & CO., Milwaukee, Wis.

**WANTED.**—We are in the market for white extracted honey, in any quantity up to two or three cars. Mail sample and give source of honey, quality, quantity, and price.

M. H. TWEED & CO., 1125 Penn Ave., Pittsburgh, Pa.

**WANTED.**—We are in the market for No. 1 white extracted honey in any quantity. Correspondence solicited. State kind, quantity, and price asked. We also have for sale 60-lb. honey-cans, 2 cans in case. Both cans and cases in A1 condition, at 30 cts. per case.

MICHIGAN WHITE CLOVER HONEY CO.,  
31-33 Griswold St., Detroit, Mich.

### Real Estate for Bee-keepers

**PECOS VALLEY** of New Mexico lands are coining \$50 to \$65 net per acre per year from alfalfa. Forty-five thousand acres of alfalfa in bloom five times a year, surrounding Artesia, means honey for the bee-keeper. Live in an ideal fruit country, where the largest artesian wells in the world constantly pour out their wealth. Artesia, the future Rose City, already has the famous "Mile of Roses." Homeseekers' excursions the first and third Tuesdays of each month. Agents wanted, to accompany parties. Write to-day to R. M. LOVE, General Agent, Artesia, N. M.

**FOR SALE.**—Delaware farm, public road; good buildings, good water; fruit, wood; rural delivery; school, churches, stores, mills, railroad depot, canneries, blacksmith shops, all convenient; an ideal place for bees, poultry, fruit, and trucking.

J. A. LUDWIG, Maryland, Md.

**FOR SALE.**—Five-acre fruit, vegetable, and bee ranch, one mile from Grand Junction, city of 10,000; 28 stands of bees; new house, honey-house, horse-wagon, buggy, tools; no failures here; finest location; pasture for 300 stands, all for \$3000.

ROY D. TAIT, Grand Junction, Colo., Rt. 3.

**FOR SALE.**—Small homestead, first-class buildings, fully equipped apiary, in one of the most desirable locations to be found; will sell for less than the improvements can be replaced for. This was the home and the apiary of the late B. Taylor at Preston. Write for particulars. ALFA-ZIEMER, Waltham, Minn.

**FOR SALE.**—California foothill ranch, San Diego Co., 160 acres, twenty-five in cultivation; house and barn; three acres orchard; 100 hives of bees; one span of horses; bee material and farming tools, \$1800.

AUSTIN E. WHITE, Fallbrook, California.

**WANTED.**—To correspond with parties desiring a location for bee culture. Miles of palmettos, black mangrove, and a good-sized bearing orange-grove. Island. Very healthy.

POSTMASTER, Carlos, Lee Co., Fla.

**FOR SALE.**—Farm of 14 acres near city of 20,000; good soil, market, and bee pasture. L. C. HOOK, Richmond, Ind., Rt. 3.

## For Sale

FOR SALE.—Tasmanian necklace shells, any quantity. Sample sent. G. H. SMITH, Ramsgate, Tasmania.

FOR SALE.—Sweet-clover seed, 15 cts. per pound, postage extra. Root's supplies. ANTON G. ANDERSON, Holden, Mo.

FOR SALE.—Shipping-cases, the no-dip kind; overstocked; get our special prices. A. G. WOLFMAN CO., Grand Rapids, Mich.

FOR SALE.—Duroc Jersey, Hampshire, and Tamworth swine; fancy poultry, Collie dogs. Send for circular. JNO. M. WHEELER, Winchester, Ky.

FOR SALE.—A full line of bee-keepers' supplies; also Italian bees and honey a specialty. Melilotus (sweet clover) seed for sale at 8 cts. per lb. Write for catalog and particulars. W. P. SMITH, Penn. Miss.

FOR SALE.—About 1300 or 1400 cases, two five-gallon cans each, practically free from nail-holes, and were new tins when originally shipped to us. Make us an offer. CLEVELAND HEALTH FOOD CO., Cleveland, O.

FOR SALE.—Beautiful long-haired Persian and Angora cats and kittens; solid whites and various colors; none better. Send stamp for written reply. KENSINGTON CATTERY, Marion, Ohio.

## Bees and Queens

FOR SALE.—75 first-class colonies of bees, mostly in ten-frame hives. J. D. HOLDENER, Carlyle, Ill.

FOR SALE.—100 colonies at Horseheads, N. Y., complete for extracted honey, \$2.50 each. WM. CARDER, Constance, Ky.

FOR SALE.—First-class apiary of 120 colonies with all supplies. Write for particulars to J. B. HALL, Box 595, Woodstock, Ont., Can.

FOR SALE.—Fine yard of 80 colonies and combs, supers, etc., at Naples. Eighty 7/8-in. fine winter-cases here. F. W. LESSER, Syracuse, N. Y. Sta. A.

FOR SALE.—100 colonies of bees in new Danz. hives at \$4.50 each; 2-frame Cowan extractor, new, \$10.00; 120 Danz. supers at 50 cts. Other supplies. W. A. LATSHAW, Carlisle, Ind.

FOR SALE.—First-class apiary of 150 colonies, fixtures and supplies; 45 are in Danz. hives; balance in Dovetailed. Good condition; no disease. Will sell very reasonable in lots to suit. For particulars write W. F. STUART, Ottawa, Kansas.

FOR SALE.—For 30 days I offer my bee-outfit at about 60 to 65 cts. on the dollar—a little disease but under good control. This is an opportunity of a lifetime for the right man. D. E. LHMEDIEU, Colo, Iowa.

FOR SALE.—Italian bees and queens now ready. Untested, \$1.00; tested, \$1.50. Bee-keepers' supplies, Root's goods. Send for prices. Eggs from Silver-laced Wyandotte poultry. N. V. LONG, Biscoe, N. C.

FOR SALE.—Moore's strain and golden Italian queens, untested, \$1.00; six, \$4.00; twelve, \$7.00. Carniolan, Banat, and Caucasian queens, select, \$1.00; six, \$5.00. Tested, any kind, \$1.25; six, \$6.00. Choice breeding queens, \$3.00 each. Circular free. W. H. RAILS, Orange, Cal.

FOR SALE.—250 colonies of bees in ten-frame hives at \$2.75 per colony; no disease; fixtures for comb and extracted honey cheap; also 22 acres of land; first-class buildings, and improvements. If not sold by Jan. 1 a reliable man is wanted to rent or run bees and farm on shares. J. H. ZEINER, Bard, Ark.

## Poultry Offers

A. I. Root's Bee-goods, Poultry-supplies, Seeds, etc. STAPLER'S, 412-414 Ferry St., Pittsburgh, Pa.

FOR SALE.—Indian Runner ducks, great layers, cheaper than ever, \$2.00 each; \$3.50 per pair. \$5.00 per trio. Circular free. KENT JENNINGS, Mt. Gilead, Ohio.

## Help Wanted

WANTED.—Ge man and wife to care for truck, poultry, fruit, and bees in Virginia. 35754 Gleanings, Medina, O.

WANTED.—Capable man 30 to 40 years of age, married, to take charge of small farm in Ohio. State experience, salary wanted, date could begin, and give names of references. Address JOHN SMITH, Gleanings in Bee Culture, Medina, O.

WANTED.—Young man to learn the poultry business, one willing to work; not much work outside of the poultry part of it. Write at once. HOUSE ROCK POULTRY FARM, East Weymouth, Mass.

## Wants and Exchanges

WANTED.—Bees. Car lots or less for spot cash. All letters answered. F. B. CAVANAGH, Springport, Mich.

SWAP.—Scholarship I. C. S., transfer value \$65.00, for poultry, incubator brooders, or Shetland pony and rig, and pay difference. GEORGE WANSEY, Cranford, N. J.

WANTED.—Refuse from wax-extractors and old comb for cash. ARCHIE COGGSHALL, Groton, N. Y.

WANTED.—Refuse from the wax-extractor, or slumgum State quantity and price. OREL L. HERSHISER, 301 Huntington Ave., Buffalo, N. Y.

## Bee-keepers' Directory

I no longer club a queen with GLEANINGS. W. T. CRAWFORD, Hinston, La.

Bee-keepers' Supply Co., Lincoln, Neb. We buy car lots of Root's goods. Save freight. Write.

No more queens for sale this fall. A. W. YATES, 3 Chapman St., Hartford, Ct.

ITALIANS, CARNIOLANS. No disease. Two-comb nucleus with queen, \$3.00. A. L. AMOS, Comstock, Nebraska.

GOLDEN yellow Italian queens—my specialty. Price list free. E. E. LAWRENCE, Doniphan, Mo.

ROOT'S BEE SUPPLIES. Send for catalog. D. COOLEY, Kendall, Mich.

Mott's long-tongues by return mail, also goldens—hardy, yet gentle, but little or no smoke. E. E. MOTT, Glenwood, Mich.

Well-bred bees and queens. Hives and supplies. J. H. M. COOK, 70 Cortlandt St., New York City.

For bee-smoker and honey-knife circular send card to T. F. BINGHAM, Farwell, Mich.

ITALIAN BEES, queens, honey, and Root's bee-keepers' supplies. ALISO APIARY, El Toro, Cal.

Golden-all-over and red-clover Italian queens; circular ready. W. A. SHUFF, 4426 Osage Ave., Philadelphia, Pa.

Root's bee-supplies at factory prices, *Black Diamond Brand Honey*, and *bee-literature*. Catalog and circulars free. GEO. S. GRAFFAM & BRO., Bangor, Maine.

QUEENS.—Improved red-clover Italians, bred for business, June 1 to Nov. 15, untested queens, 60 cts.; select, 75 cts.; tested, \$1.00 each. Safe arrival and satisfaction guaranteed. H. C. CLEMONS, Boyd, Ky.

Improved Italian queens now ready. Nuclei and colonies May 1 to 10. Over twenty years a breeder; 500 colonies to draw on. Free circulars and testimonials. For prices see large advertisement in this issue. QUIRIN-THIE-QUEEN-BREEDER, Bellevue, O.

ITALIAN BEES AND QUEENS. I breed three-banded stock only, and use the finest breeding stock to be had. For prices, see display advertising columns in this issue. Send for price list. Twenty-five years' experience. J. J. WARDELL, Uhrichsville, O.

**TENNESSEE QUEENS.**—Best that experience can produce. Untested three-band and goldens, \$1.00 each; 6 for \$5.00; 12 for \$9.00. Caucasians, \$1.25 each. Write for circular; order goldens from Ben G. Davis; others from John M. Davis, Spring Hill, Tenn.

Breeding queens of pure Caucasian and Carniolan races—price \$3.00. Order from A. E. Titoff, Expert in Apiculture, with Russian Department of Agriculture, Kieff, Russia. Remit with orders. Correspondence in English.

## SPECIAL NOTICES

By OUR BUSINESS MANAGER

THE LORE OF THE HONEY-BEE, BY TICKNER EDWARDS.

This is a fine new book about bees by an authority who wields a facile pen—an original work, beautifully illustrated and finely printed. Something fine for the long winter evenings. See review of the book in this issue, page 1170. Price \$2.00.

Mr. W. S. Williams, of Julian, Pa., called here recently on a trip through the State. Mr. Williams is one of those bee-keepers who believe in preparing long in advance for the next honey harvest. The demands of his own yard and the inquiries of his neighbors warrant him in laying in a good stock of supplies in the fall when the largest early-order discount is in force.

### L'ELEVAGE INDUSTRIAL DES REINES.

We are pleased to notice that Mr. E. L. Pratt's book, "Commercial Queen-rearing," may now be obtained in the French language. It makes a very neat and attractive booklet with the above title, and, so far as we can see, great pains have been taken with the work of translation, and in all respects it is quite equal to the English edition, and possibly a little better. Those who prefer to read in French will find the perusal of this little work will supply the reader with the latest and most scientific ideas in practical queen-breeding. The price is 50 cts. postpaid. Orders for it can be sent to The A. I. Root Co., Medina, Ohio.

### DISCOUNTS FOR EARLY CASH ORDERS.

On October cash orders we allow 6 per cent discount.

|                            |
|----------------------------|
| " November " " " " 5 " " " |
| " December " " " " 4 " " " |
| " January " " " " 3 " " "  |
| " February " " " " 2 " " " |
| " March " " " " 1 " " "    |

This discount will apply on all articles listed in our regular catalog at current corrected prices to date except as follows:

Tinned wire, paint, Bingham smokers, Porter bee-escapes, glass and tin honey-packages, scales, bees and queens, bee books, papers, labels, printed matter, bushel boxes, seeds, and specialties not listed in our general catalog. Where any or all of these articles in a general order do not exceed fifteen per cent of the whole order the discount may be deducted from the whole order, including these items which are otherwise excepted.

## Special Notices by A. I. Root

### PROF. HOLDEN'S BOOK ON CORN CULTURE.

In our issue for Dec. 15, 1906, I pronounced the above book the most valuable one of its size that has been given to the cause of agriculture in the last hundred years, and I think so yet. By following the teachings of that book we have now ten acres of corn almost ready to husk that has given us a yield twice as large as we should have had, if I had not got hold of the book and afterward heard Prof. Holden give his corn lecture. What brings the matter up just now is that the book is now sold by the Farm News Co., Springfield, Ohio, for the very small sum of 10 cts. You know I have found some fault about big prices for small books on poultry and other subjects; but this corn book is certainly a most wonderful bargain. If carefully studied by the average corn grower it ought to be cheap at a dollar, and I might almost say ten dollars. I hope it may have a tremendous sale, and that every farmer who does not already have it will at once get a copy.

### SITTING HENS—HOW TO CURE THEM.

In answer to Dr. Miller's question on the first page, I would reply that sitting hens have not troubled me this summer, because I am glad to see them and give them some eggs and let them

sit. Your remedy is excellent. It is like carying bees to an out-apiary. With sitting hens, as with almost everything else, a stitch in time saves nine. If the hen is taken the very first evening she is found on the nest, when it is time to go to roost, and shut her up, or, better still, take her outside the yard or to some other yard, she will often give it up and go to laying almost immediately. If she sits on the nest just one night she will be so much the more stubborn about it. Don't let a single hen set on eggs even one night where you do not want sitting hens. If you are obliged to shut them up somewhere, do not put them on the ground or on the floor. Have the bottom of the box either wire cloth or lath, so the hen can not warm up the ground or floor beneath her. Cool her off, and get her over her fever for raising chickens, as quickly as possible. I have frequently broken them of their desire to sit by keeping them away from their accustomed nests just two nights. It is a much easier matter where the nests are some distance apart; and, even though it does make more labor in gathering the eggs, I much prefer to have the nests scattered about in different parts of the yard. In cold weather, when they are confined to the poultry-house I would have them in different parts of the inclosure, say some up near the roofs, and some down in the corners. The upstairs part of the Philo poultry-house seems to please the hens to a dot. Where you have several hens sitting at the same time, the nests should all be far enough apart so there can be no "differences of opinion" as to which hen the nest belongs to.

### NAVIGATING THE AIR; THE WRIGHT BROS. UP TO DATE.

On page 1097, Sept. 1, I said, "May God grant that no accident may happen to these two intrepid brothers." I then had in mind, and have had in mind all along, that during these preliminary experiments there would be accidents, and, in all probability, loss of life. Well, an accident has happened; and although Orville Wright has been spared so that he may take up his work again soon, we regret the loss of the life of his companion who was with him. Most of you have seen accounts in the papers. One of the wings of the propellers broke in midair; and before young Wright could adjust his machine it came down to the ground with a crash. It is reported that he said if he had been 75 feet higher up he could have brought the machine into shape so it would have alighted safely. There is quite a misapprehension, I notice by the papers, in regard to danger with the Wright machines. Their first experiments were with gliding machines, so that if any thing happened to their engine they could still glide to the ground; and no mishap would have occurred this time had Mr. Wright been able to cut off the power the very instant the wing broke. These propeller wings are selected of the very best Vermont spruce, or at least such was the case when I was with them. This spruce has more strength in proportion to its weight than any other known material, not even excepting aluminum; and these blades are most thoroughly tested before using them. The extra strain on the machine by having a second passenger is probably what caused it to break, although it has been suggested that a broken wire may have stuck the blade and caused the fracture. Since this accident I suppose every wire and piece of wood will be still more severely tested than ever before. Wilbur, the brother in France, has said, we are told, that, instead of taking a passenger, he will, at least for the present, carry a bag of sand equal in weight to a passenger.

Orville's injury, so far as we can learn by the papers, was a broken bone in his thigh, and one or more ribs fractured. As we go to press we are told that his prospects for full recovery are very favorable. We learn from the *Woman's National Daily* that on the 22d of September Wilbur Wright broke all previous records by remaining in the air 91 minutes, and covering in all about 61 miles. Here is what the paper says about it:

"There was nothing marvelous in the performance," Wright said to a group of admirers. "The machine is built on the right principles; and as long as it is properly manned it has got to fly. I could have stayed up another hour or until the petrol was exhausted; but it was getting dark and I thought it best to come down. I am glad for my sake that the flight was such a success, but doubly glad on Orville's account. Many thought when my brother met with his regrettable accident last week that our machines were failures, and that we had been enabled to fly largely through good luck. Well, I think they ought to be satisfied now that the aeroplane is all that we have claimed for it, and that the coming machine will be built along the lines that we have laid down."

Ten thousand persons witnessed the record-breaking flight of Mr. Wright.

### SHALL WHISKY RULE?

States represented and ruled by ignorant men must remain ignorant. States represented by corrupt men remain corrupt. States ruled by gamblers are gambling States, and States represented and ruled by whisky men remain drunk; and the unspeakable pity is that the home, with its tender charges, must share the blighting influence of these evils.—*The Seattle Post-Intelligencer*.

## Convention Notices.

### MEN AND WOMEN WHO EXPECT TO ATTEND THE NATIONAL CONVENTION.

The following persons have taken the pains to write and tell me that they expect to attend the coming National convention at Detroit:

Aspinwall, L. A., and wife.  
Abbott, E. T.  
Ahlers, H. C., and wife.  
Barb, J. S.  
Brovald, A. C.  
Carr, E. G.  
Cov-you, Elias E.  
Cavanagh, F. B., and wife.  
Chryster, W. A.  
Chapman, S. D.  
Cameron, R.  
Carter, Wm.  
Cutting, H. D.  
Dickinson, E. and wife.  
Darby, M. E.  
France, N. E., wife, children.  
Fowls, Chalon, and wife.  
Forbes, W. E.  
Furnass, W. C.  
Frazier, W. S.  
Gute, Martin.  
Hutchinson, W. Z., and wife.  
Hutchinson, Elmer, and wife.  
Halter, A. J.  
Hilton, Geo., and wife.  
Holtermann, R. F.  
Harmer, Walter.  
Hunt, E. M.  
Hurley, James J.  
Hand, J. E.  
Hershiser, O. L.  
Huber, L. B.  
Lewis, J. L., and wife.

Muth, Fred W., and wife.  
McKnight, W. L.  
Miller, F. J., and wife.  
McDonald, Fred B., and wife.  
Morrison, W. K.  
Myers, Wm.  
Myers, Thomas.  
Manley, Wm. J.  
Manley, Herbert J.  
Mandeville, M.  
Pressler, E. E.  
Pettit, S. T.  
Phillips, E. F.  
Root, A. I.  
Root, E. R.  
Root, H. H.  
Smith, C. F., and wife.  
Sims, J. S.  
Smith, F. H., and wife.  
Soper, W. D.  
Strittmatter, F. J.  
Tyrrell, E. B.  
Taylor, R. L., and wife.  
Townsend, E. D., and wife.  
Tyrold, John.  
Thompson, Decker.  
Werner, Louis.  
Wilcox, Franklin.  
White, W. G.  
Williamson, G. T., and wife.  
Wood, A. D. D.  
Wright, W. D.  
York, Geo. W.

Let no one think that the foregoing are all the persons who will be present, as not one person in a dozen will take the trouble to write to the Secretary and say that he is going; besides, many don't make up their minds to go, until the very last moment. Notice the number of ladies who are to be present. There will be more ladies present at this convention than have ever before graced a convention with their presence. Come, and bring your wife.

W. Z. HUTCHINSON, Sec.

The semi-annual convention of the Connecticut Bee-keepers' Association will be held Friday, October 16, 1908, room 50, State Capitol, Hartford. All bee-keepers are cordially invited to meet with us. Bring something for exhibition.

JAMES A. SMITH, Sec'y, Box 38, Hartford.

### PANHANDLE BEE-KEEPERS' CONVENTION.

The Panhandle Bee-keepers' Association will meet in Knights of the Golden Eagle Hall, corner 38th Street and Jacob Street, Wheeling, West Virginia, on Monday, Nov. 16.

Blaine, Ohio.

W. L. KINSEY, Sec.

The annual meeting of the Northern Illinois and Southern Wisconsin Bee-keepers' Association will be held in the courthouse in Rockford, Ill., on Tuesday and Wednesday, Oct. 20 and 21, 1908. All interested in bees are invited to attend.

Cherry Valley, Ill.

B. KENNEDY, Sec.

### HOTEL TULLER.

The editors of GLEANINGS will make their headquarters at the Tuller during the convention. Our friends are invited to secure rooms there also.

E. R. ROOT.

### PROGRAM FOR THE NATIONAL CONVENTION.

The National Bee-keepers' Association will hold its annual convention, October 13, 14, 15, in the Sun Palace of the Wayne Hotel, at the foot of Third St., Detroit, Mich. Headquarters will be at the Wayne Hotel, where the rates to bee-keepers are \$2.50 per day when two persons occupy the same room. There are plenty of other hotels in the vicinity where the rates vary from \$1.25 to \$2.25 per day.

The Michigan State Bee-keepers will hold a session at the same place on the afternoon of the 13th, beginning at 2 P. M. The first regular session of the National will be held on the evening of the 13th.

#### OCTOBER 13—FIRST DAY—EVENING SESSION.

"Demonstration of Handling Live Bees in a Cage," by E. R. Root, of Medina, Ohio.

"Bee-keeping in Hawaii," by Prof. E. F. Phillips, of the Apicultural Bureau, Washington, D. C. This lecture will be illustrated by stereopticon views secured by Prof. Phillips during his recent trip to Hawaii.

"Moving-picture Exhibition," by E. R. Root, of Medina, Ohio. To run this film through the lantern requires about ten minutes, and it gives a fair idea of some of the "stunts" they do in England when handling bees. Some of them are decidedly mirth-provoking.

#### OCTOBER 14—SECOND DAY—MORNING SESSION.

8:00 A. M.—President's Address.

"The Bacteria of Bee Diseases," by Dr. G. F. White, of the Apicultural Bureau, Washington, D. C.

"How to Detect and Know Bee Diseases," by W. D. Wright, of Altamont, N. Y., one of the New York Inspectors of Apiaries.

#### RECESS OF 15 MINUTES.

"Getting Rid of Foul Brood with the Least Financial Loss," by R. L. Taylor, of Lapeer, Mich., Inspector of Apiaries for Michigan.

General Discussion on Diseases of Bees.

Question-box.

#### ADJOURNMENT.

#### OCTOBER 14—SECOND DAY—AFTERNOON SESSION.

2:00 P. M.—Debate on the following: "Resolved, That an eight-frame Langstroth hive is preferable to a larger hive in extracted-honey production." affirmative taken by S. D. Chapman, of Mancelona, Mich., and the negative by R. F. Holtermann, of Brantford, Ont. Each contestant is allowed to speak twice, using not more than 15 minutes each time.

General discussion of the subject.

Question-box.

#### RECESS OF 15 MINUTES.

"Turning Winter Losses into Profit," by W. J. Manley, of Sandusky, Michigan.

Question-box.

Adjournment, and members photographed in a group.

#### OCTOBER 14—SECOND DAY—EVENING SESSION.

7:00 P. M.—This session is to be in a lighter vein—as the story is to more solid reading. It is to be in imitation of the toasts that usually follow a banquet—that is, responses to sentiments. The speakers are to remain unknown until announced by the toastmaster, but the list of topics is as follows:

Securing Legislation for Bee-keepers.

Rough Spots in the Pathway of an Inspector of Apiaries.

Late Apicultural Inventions.

The Possibilities of Future Bee-keeping.

The Cost of Honey Production.

Bee-keepers as Temperance Reformers.

The Friendship of our Fraternity.

#### ADJOURNMENT.

#### OCTOBER 15—THIRD DAY—MORNING SESSION.

8:00 A. M.—"Locating Apiaries," by E. D. Townsend, of Remus, Mich.

Discussion.

Question-box.

#### RECESS OF 15 MINUTES.

Question-box.

#### ADJOURNMENT.

#### OCTOBER 15—THIRD DAY—AFTERNOON SESSION.

2:00 P. M.—"How to Secure Good Prices for Honey, even in Years of Bountiful Yields," by O. L. Hershisser, of Kenmore, N. Y.

Discussion.

#### RECESS OF 15 MINUTES.

Question-box.

Adjournment to see honey extracted with an eight frame automatic extractor, with gasoline-engine as power.

The foregoing is simply an outline, a sort of skeleton, which will be filled out with good things.

W. Z. HUTCHINSON, Sec. N. B. K. A.

#### PREMIUMS OFFERED AT THE NATIONAL CONVENTION.

Through the generosity of the leading manufacturers and dealers the following liberal premiums are offered for the display of bees, honey, and wax at the coming national convention:

Best and largest display of single-comb nuclei of different varieties of bees, accompanied by queens; condition of bees, purity of race, and beauty of hives to be the competing points.

1st premium, 2000 No. 1 sections by the G. B. Lewis Co., Watertown, Wis.; 2d premium, \$3.00 Italian breeding-queen from the Medina apiary of The A. I. Root Co.; 3d premium, two years' subscription to the *Canadian Bee Journal*, by the Hurley Printing Co., of Brantford, Ontario.

Best ten sections of comb honey, completeness of filling of section, evenness of surface of comb, completeness of capping, freedom from travel-stain, and general neatness and appearance to be the competing points.

1st premium, 1000 No. 1 sections from the G. B. Lewis Co., of Watertown, Wis.; 2d premium, cloth-bound copy of the A B C and X Y Z of Bee Culture, by The A. I. Root Co.; 3d premium, one year's subscription to the *Canadian Bee Journal*, by the Hurley Printing Co., and one year's subscription to the *American Bee Journal* by Geo. W. York & Co., Chicago, Ill.

Best ten pounds of liquid extracted honey, quality and manner of putting up for market to be considered.

1st premium, 1000 No. 1 sections, by the G. B. Lewis Co., of Watertown, Wis.; 2d premium, Jumbo copper smoker, by The A. I. Root Co.; 3d premium, Root Standard tin smoker, by W. D. Soper, of Jackson, Mich., and one year's subscription to the *American Bee Journal*, by Geo. W. York & Co.

Best ten pounds of granulated honey; quality, including fineness and smoothness of grain, and manner of putting up for market to be considered.

1st premium, 1000 No. 1 sections, by the G. B. Lewis Co., of Watertown, Wis.; 2d premium, Standard tin smoker, by The A. I. Root Co.; 3d premium, one year's subscription to the *American Bee Journal*, by Geo. W. York & Co.

Best ten pounds of beeswax; color, texture, and beauty of the cake or cakes in regard to shape to be considered.

1st premium, one \$5.00 Italian breeding-queen from the Medina apiary of The A. I. Root Co.; 2d premium, one year's subscription to the *American Bee Journal*, by Geo. W. York & Co.; 3d premium, one Root hive-tool by The A. I. Root Co.

The most important late apicultural invention that has not before been awarded a premium.

1st premium, \$5.00 worth of bee-supplies, "Root Quality," by M. H. Hunt & Son, of Lansing, Mich.; 2d premium, one full leather-bound copy of the A B C and X Y Z of Bee Culture, by The A. I. Root Co.; 3d premium, one copy of *Advanced Bee Culture*, by W. Z. Hutchinson, Flint, Mich., and one year's subscription to the *American Bee Journal*, by Geo. W. York & Co.

For the best single section of comb honey, A. G. Woodman & Co., of Grand Rapids, Mich., offer one Woodman Protection hive; for the second-best single section they offer 1000 No. 1 Lewis sections; for the third best, one advanced bee-veil.

For the best single section of honey stored in a Marshfield section box, W. D. Soper, of Jackson, Mich., offers 500 No. 1 Marshfield sections. For the best ten pounds of comb honey produced with Dittmer foundation, Mr. Soper offers three pounds of Dittmer's extra-thin foundation.

The judge to pass upon the above exhibits will be appointed by the president. W. Z. HUTCHINSON, Sec. N. B. K. A.

### KIND WORDS.

GLEANINGS pays better than papers with a circulation of 100,000 or more.

I am very much surprised at the results that your paper brought me. The first advertisement that I ever inserted in your journal was on page 250 of your Feb. 15th issue; and I must state that it has brought me better results than any advertisement that I ever had in papers that boasted of from 105,000 to 250,000 readers. Iowa City, Ia., March 3. J. F. BUCKMAYER.

A small advertisement brings *lots* of orders. Notice what she says—*orders*, not inquiries.

The A. I. Root Co.:

My advertisement in your journal is bringing lots of orders, and I am sending out better queens than ever this year. I get some very flattering compliments for queens sent last year. Waterloo, N. Y., June 24. MRS. J. W. BACON.

Bees all sold from advertisement in GLEANINGS.

The A. I. Root Co.:

My bees are all sold out to parties who saw my advertisement in your journal. We find it a splendid advertising medium. Minneapolis, Minn. P. H. DAVIS.

The A. I. Root Co.:

The 25-line property-for-sale advertisement brought me letters from Canada to Mexico, and from the Atlantic to the Pacific. I do not know how many, but lots of them. Lusardi, Cal., July 29. A. J. BURNS.

# SUBURBAN LIFE

THE LEADING MAGAZINE FOR THE SUBURBAN HOME

**PRACTICAL**

**PROGRESSIVE**

**HELPFUL**

**TIMELY**

**BIG**

**BROAD**

**BEAUTIFUL**

**SATISFYING**

## THE BEST PRINTED PERIODICAL IN AMERICA

The magnificent illustrations and unexcelled presswork of Suburban Life delight the eye of the reader, while the high standing of our writers makes every line of reading matter of practical value to the great number of people who reside in suburban homes, or who are truly appreciative of country life, with its manifold outdoor interests. You read Suburban Life because every number is brimfull of bright, spicy, interesting matter, as you will note from a glance over a partial list of the Table of Contents for the November issue:

**FIVE ACRES AND CONTENTMENT**  
**A WORKSHOP AT HOME**  
**MAKING A HOME GYMNASIUM**  
**A CLUBROOM FOR THE BOYS AND GIRLS AT HOME**

**THE SMALL ENGINE AND THE MOTOR**  
**THE STEREOPTICON IN THE HOME**  
**A WOMAN'S SQUAB PLANT**  
**A HALLOWE'EEN PARTY**  
**DRESSING THE HORSE, ETC.**

Other interesting features for succeeding numbers appeal to every member of the home, and include:

**SOCIAL LIFE**—The Long Day of the Commuter's Wife. Evening Amusements at Home.

**LIVING FROM THE LAND**—Can I Make a Living from a Small Place? Personal Experiences of People Who Are Making Good, Comfortable Incomes from Less than Twenty Acres.

**THE NEW NATURE STUDY**—Night Prowlers Who Aid the Farmer. What Will Happen When the Birds Are Gone?

**TIMELINESS**—What Ought to Be Done Each Month About the House and Grounds, in the Greenhouse, the Stable and Poultry Yard.

**THE HOME**—Artistic and Sensible Window Draperies. New Things in Furniture. Sleeping-Porches.

**WOMAN'S WORK**—Personal Experiences of a Number of Women Making a Living in the Country.

**FLOWER AND VEGETABLE GARDENS**—An Electric Hotbed. Garden Insects and Diseases.

**OTHER FEATURES**—Poultry, pigeons, the horse, the cow, the dog, the cat, bees and pet stock, will receive the attention which their importance merits.

**CIVIC IMPROVEMENT**—This important topic will be treated in a practical manner, and also the subject of conservation of our natural resources.

These are but a few of the many good things in store for our Suburban Life readers the coming season

# Don't Buy a Stove or Range Until You First See How Much You Save By Getting

## "A Kalamazoo Direct to You"

TRADE MARK REGISTERED

**Y**OU want to make every cent you spend this year, **count for quality and economy.**

If you need a stove or range, don't buy until you get our **factory prices.** I promise you that I will save you \$5, \$6 or \$10 on our smallest stoves, and as high as \$18, \$20 and even \$30 on our largest. And I promise you that you cannot get **anywhere at any price, a better stove or range than the Kalamazoo.**

Just let me quote you prices. Take our catalogue and **compare the Kalamazoo quality and prices,** with the best line of stoves and ranges you can find sold at retail. That will tell the story. You can see for yourself. You want to save money and you want to get high quality. Why not investigate our plan, then? Why not let me show you the difference between manufacturers' prices and retail prices on stoves or ranges?

We sell to you, direct from the factory, at actual factory prices,

## On 360 Days Approval Test—We Pay the Freight

**All Kalamazoo** cook stoves and ranges have patent thermometers which make baking and roasting easy.

I promise, in black and white, to refund your money—every cent of it—if you do not find your purchase in every way exactly as represented.

Remember, every Kalamazoo is of the highest possible grade, made of the best materials and in the best manner. You deal directly with the manufacturers—a company that has a larger number of individual customers than any other stove company in existence. We have sold thousands of stoves and ranges to readers of this journal, and no doubt can refer you to near neighbors who have saved money by buying a Kalamazoo. Many customers write that they have saved enough on a single Kalamazoo to pay for a whole season's fuel. You can save enough to buy a new suit, a new dress, an article of furniture, or perhaps to pay your taxes. Is it not to your interest to get our prices?

## Send Postal for Catalogue No. 416

describing more than 300 sizes and styles of Coal and Wood Ranges, Coal and Wood Heaters, Hotel Ranges, Base Burners, Laundry Stoves, Etc.

I know that if you get our prices—and see our quality you will not even think of buying any other make. Let me show you how much you can save.

**William Thompson, Vice-Pres. & Gen. Mgr.**  
**KALAMAZOO STOVE CO., Mfrs. Kalamazoo, Mich.**

## Fashion Book Free!

I want to send you my handsome new book showing over 400 of the latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for 5 cents each. They are the same patterns you have always paid 10c and 15c for at the stores, made by the same people, and correct in every detail.

### HOW I DO IT.

I publish **The Home Instructor**, an illustrated woman's magazine and I want your name on my subscription list. **The Home Instructor** is bright, entertaining, clean and instructive—just the sort of a paper you should have in your home. It has departments for every feature of home life, and prints the choicest fiction every month. Every issue has several pages devoted to the latest fashions, fully illustrated.

## My Special Offer.

Send me 25 cents and I will send you **The Home Instructor** for two years and will send my big fashion book to you free. I will also agree to sell you any pattern you want thereafter for 5 cts. I can sell them for 5 cents because I buy them by the thousand and don't make any profit. I don't want the profit. I want your subscription to **The Home Instructor**. You will save many times the cost of my offer in a year. Write to-day **A. OTIS ARNOLD, Dept. B Quincy, Ill**

 Concrete Construction on the Farm . .50

Total . . . . . \$2.25

**ALL OF THE ABOVE IF  
 ORDERED OF CLEAN-  
 INGS FOR ONLY**

**☐ \$1.50 ☐**

**THE OHIO FARMER** is published in the interests of that great body of American farmers who follow mixed farming. You will find it an **authority** on live-stock breeding in all its branches, dairying, cattle-feeding, poultry, horses, bees, horticulture, gardening, etc.; a help in **every one** of your every-day farm operations.

The questions of the day are handled **independently** and **fearlessly**, for the farmers' interests, **without political bias**; and the **household department**, including short and continued stories, makes it interesting to the whole family.

For nearly **thirty years** it has been a **leading** farm paper of this country, and stands in a class by itself. It covers the field of diversified farming with a large staff of practical correspondents and editors. The Ohio Farmer has **fought and won** many farmers' battles; and if you have any interest whatever in farming, it **will pay you** to read it.

We guarantee that **The Ohio Farmer** will invariably stop on expiration of subscription paid for.

## Concrete Construction on the Farm.

Realizing the present immense use, and the rapidly increasing importance, of cement and concrete upon the farm, and also the necessity of a comprehensive book upon the volume, this matter was written especially for The Ohio Farmer, and contains complete and easily understood working instructions, with illustrations, for building—**Foundations, Silos, Walks, Floors, Bridges, Cisterns, Culverts, Tanks, Posts, Drain-tile, etc.**

This book will give you a complete working knowledge of this timely and important subject, and probably save costly errors.

In no other book can you obtain the same information, which is the result of the experience of one of the acknowledged experts of this country.

The price is 50 cents postpaid, but for a short time we will send

## A Copy of this Book Free

to each person paying for one or more years' subscription to The Ohio Farmer and Gleanings.

It is not sent free with subscriptions for less than one year, and **must always be requested** when the order is sent.

Take advantage of this at once, as we reserve the right to withdraw the offer at any time.

Address all orders to GLEANINGS IN BEE CULTURE, Medina, Ohio

**OUR  
GRAND 1908  
OFFER**

**NEW  
LUMBER**

**FIFTY MILLION FEET  
AT REDUCED  
PRICES**

Bought at Forced Sales from Manufacturers. It makes us Headquarters for Thousands of Genuine Bargains in Lumber and Building Supplies. We save you money.

**BIG  
SPECIAL  
SALE**

**SAVE 30 TO 60 PER CENT. BUY DIRECT. BUILDING SUPPLIES OF EVERY KIND**

The Chicago House Wrecking Co. Purchased at forced sales, 50,000,000 feet of new lumber. We are making special concessions to those who buy at once. Our prices today are far lower than prices have been for years. Order now for immediate or future use. Quick action will save you big profits. Remember prices elsewhere which are even now high, are bound to rise. We can quote you 30 to 60 per cent better prices for the same lumber than your local dealer. We guarantee every carload to be exactly as represented. Closest inspection of our lumber stock invited.

Call at our warehouse and yards at Chicago and see the lumber we are offering and you will recognize that it is all we say of it. Make your own selection and see it loaded. It is not necessary to come to Chicago, however, unless you wish to. We can fill your order by mail with just what you want and guarantee you absolute satisfaction. Ours is the largest direct to the

consumer lumber headquarters in the world. We sell millions of feet annually. Orders filled from every part of the United States. No matter where you live you can save money by supplying your building wants here.

We do not figure fancy prices, but quote figures that command your patronage. Whether your order is large or small we can save you money on it. Our tremendous business of millions of dollars annually is your best guarantee of complete satisfaction of every purchase made from us. In our enormous stock of new lumber of every kind we have just what you need for every purpose. Don't buy a stick of material until you get our prices. We offer you everything in the lumber and building supply line needed for residences, farm homes, stores, churches, barns, outbuildings of every kind, sidewalks and fencing. In short any kind of a structure requiring lumber, at from 30 to 60 per cent less than your local dealers or lumber yards ask for it.

**IMPORTANT! Send Us Your Lumber Bill For Our Estimate**

Make up a list of what you need. Send it to us for our price. If you are putting up a building of any kind whatsoever let us figure with you. Our prices talk louder than words. Have your carpenter or contractor send us your list of what is needed if he has charge of your building. Don't pay exorbitant prices to the lumber trust with their long line of lumber yards all over the country. Don't let the local dealer soak you with his heavy profit. Remember: Chicago House Wrecking Company buys millions of feet at a time under circumstances of forced sales which means sacrificed prices and enables us to sell even as low as cost without loss. You take no chances in dealing with the Chicago House Wrecking Company. Whether for \$1 or \$10,000 your order will be filled carefully. Our lumber and supplies are guaranteed exactly as represented. If you have no need for a whole carload yourself get your neighbors to club in with you. By buying a carload you can save all kinds of money on freight charges.

We have railroad trains running through our main warehouses and buildings and can load a car to good advantage to you. You can include in this same car, pipe, plumbing material, roofing, wire, fencing, furniture, hardware and merchandise of every kind.

We also furnish you building and barn plans absolutely free upon request. Write us for any information or advice you want and we will have our staff of architects answer every inquiry promptly. Our free book of plans is sent if you mention this paper. We simplify your building proposition.

Our business demands quick action. We must keep our stocks moving. This means prompt shipment—no annoying delays. Let us help you lay out your plans. We will relieve you of every detail. That is what our Special Builder Service is for. Be sure and send us your lumber bill for our estimate. Feel free to write for anything you want to know along the line of building supplies, furnishings, etc.

**WE PURCHASE OUR GOODS AT Sheriffs' and Receivers' Sales**  
Hundreds of Big Money Saving Bargains for Every Builder. Don't Build Your House, Barn, Store, Corn Crib, Church, Etc., without getting Our Big Lumber Offer. Lowest Prices on Millwork Supplies, Roofing, Water Supply Outfits, Paints, Plumbing Supplies, Hardware, Heating Outfits, Furniture, Carpets, Linoleum, Etc.

## Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

### EASTERN GRADING-RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**A No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

### NEW COMB-HONEY GRADING-RULES ADOPTED BY THE COLORADO STATE BEE-KEEPERS' ASSOCIATION.

**No. 1 WHITE.**—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 1 LIGHT AMBER.**—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separated honey to average 21 pounds net per case of 24 sections; no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 2.**—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separated honey to average not less than 19 pounds net.

Cases of half-separated honey to average not less than 20 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 21 pounds net per case of 24 sections.

**INDIANAPOLIS.**—While prices are not high, the demand for honey has never been better—a fact that can be attributed to the quality of goods now on our market. This is a white-clover district, and our market is almost free from honey from other sources. Producers are offering fancy white comb at 12½; No. 1 white, 12; white clover, extracted, in five-gallon cans, 7. Some amber honey is being offered, but the demand is not sufficient to establish a price. Beeswax is steady at 28 cts. cash, or 30 cts. in exchange for merchandise.

Oct. 5. **WALTER S. POWDER, Indianapolis.**

**COLUMBUS.**—The market shows a little more activity in honey, and some inquiries from out-of-town buyers are being received. We quote: Fancy white, 15; No. 1 white, 13½ to 14; No. 2 white, 12; amber, 10. We are in position to handle good stock.

Oct. 7. **EVANS & TURNER, Columbus, O.**

**KANSAS CITY.**—There is a good demand for honey here, but prices here are somewhat lower than last month, \$3.00 being about the top of the market for white comb honey; amber, \$2.75 per case. There is also a good demand for extracted honey, but there is very little here, white selling at 8, amber at 7. Beeswax brings 25 to 28.

Oct. 5. **C. C. CLEMONS PRODUCE CO., Kansas City, Mo.**

**ZANESVILLE.**—On account of the fruit season and generally quiet condition of trade, the demand for honey is rather slack. For strictly No. 1 to fancy white comb the jobbing trade would pay 13 to 14, and for extracted, 7 to 8. The market is pretty well stocked with comb, and prices are weakening somewhat. No. 1 to fancy brings 16 to 17 wholesale, and extracted in tin cans, 9 to 10. For good yellow beeswax, purity guaranteed, I am offering 28 cts. cash or 30 in exchange for bee-supplies f. o. b. here.

Oct. 6. **E. W. PEIRCE, Zanesville, O.**

**ST. LOUIS.**—Our market to-day is in precisely the same condition—dull on all grades of honey, especially comb honey. We quote: Fancy white comb honey, 12 to 12½; choice amber, 11 to 11. Broken or leaking honey sells at considerably less. Choice amber honey in barrels and half-barrels brings 6 cts.; in five-gallon cans, 6½ to 7. Dark and inferior grades rule at less. Beeswax, choice pure, brings 28.

Oct. 5. **R. HARTMANN PRODUCE CO., St. Louis, Mo.**

**SAN FRANCISCO.**—Prices quoted by local dealers show no change. There is still a small movement of new honey from the producing districts, though the greater part of the crop has been marketed. The demand is quiet. We quote: Water-white comb, 16 to 17; white, 15; water white, extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 5½ to 5¾; candied, 5½ to 5¾.—*Pacific Rural Press*, Oct. 3.

**CHICAGO.**—Beginning with this month we usually have an active trade in honey, and there has been quite a little movement in it this week; but the stocks here are quite large, and widely distributed. Firms that have not had any honey for some years are getting from five cases to a larger quantity, and they wish to dispose of it as soon as possible, which means taking a lower price than the market is endeavoring to get, so that some lots of No. 1 to fancy have sold at about 12 cents. The ruling prices asked now for A No. 1 to fancy grades are 13 to 14 cents, and for grades lower, from 1 to 3 cts. per lb. less. This includes the amber. From 7 to 8 cts. per lb. is asked for the best grades of white extracted, and 5½ to 6½ for the amber grades. Beeswax is steady at 30.

Oct. 3. **R. A. BURNETT & CO., Chicago.**

**ALBANY.**—The demand for honey is increasing now. The crop in this vicinity is unusually light. The market will have to depend on outside territory more than usual. We quote: Finest white clover, 16; A No. 1, 15; No. 1, 14 to 15; buckwheat, 13 to 14; mixed, 13 to 14; extracted, white, 6; amber, 7½, dark or buckwheat, 7 to 7½. Beeswax is scarce at 30 to 32.

Oct. 10. **H. R. WRIGHT, Albany.**

**CINCINNATI.**—Since our last report, cooler weather has set in, which has stimulated the demand for comb honey wonderfully. Buyers are interested now after having refused to take hold so long as we had warm weather. For strictly fancy comb honey we are getting from 14 to 16 cts. Lower grades are always disposed of at a sacrifice, and for that reason we do not encourage shipments of inferior grades to this market. Amber extracted honey in barrels is selling at 5½ to 7, according to quality and quantity purchased. Extracted white-clover honey is selling at 7½ to 9, which is likewise in accordance with the quality and quantity. We are paying 27 cts. per lb. for good to choice beeswax, free from dirt, delivered here. We believe all bee-keepers should ship their comb honey to their markets before cold weather sets in.

Oct. 5. **THE FRED W. MUTH CO. Cincinnati, O.**

**SCHENECTADY.**—The receipts of honey are more liberal, but the demand is not equal to that of last season, and we do not look for top-notch prices. This is presidential year with its usual uncertainties, and which is not productive of confidence in business lines. We quote: Fancy white, 15 to 16; No. 1, 14 to 15; No. 2, 12 to 13; mixed, 11 to 12; fancy buckwheat, 12 to 13; No. 1, 11 to 12; light extracted, 7 to 8; dark, 6½ to 7½.

Oct. 5. **CHAS. MACCULLOCH, Schenectady, N. Y.**

**DENVER.**—We quote No. 1 white comb honey, per case of 24 sections, \$3.15; No. 1 light amber, \$3.00; No. 2, \$2.85; strained and amber extracted, 6½ to 7½; light amber, 7½ to 8½; white extracted, 8½. We pay 24 cts. for clean yellow beeswax delivered here. Owing to a large supply of fresh fruit in this section the demand for comb honey is light at present.

Oct. 6. **THE COLORADO HONEY PRODUCERS' ASS'N., Denver, Col.**

# SUBSCRIPTION OFFERS...

**Offer No. 1B.** A B C OF BEE CULTURE (1908 edition), and GLEANINGS one year for \$2.25.

**Offer No. 2B.** HOW TO KEEP BEES, and GLEANINGS one year for \$1.50. A hand-book for those who keep bees for happiness and honey, and, incidentally, for money. It serves as an introduction to more extended manuals, such as our A B C.

**Offer No. 3B.** FORTY YEARS AMONG THE BEES, by Dr. C. C. Miller. In this handsome book the author genially describes his methods and ideas in producing vast quantities of fancy comb honey. He has a happy knack of making every thing very plain and easily understood. He tells all he knows. This book and a year of GLEANINGS for \$1.75.

**Offer No. 4B.** STANDARD ROOT SMOKER, and GLEANINGS one year, \$1.85. One of the best smokers made, both in principle and construction.

**Offer No. 5B.** WHAT TO DO AND HOW TO BE HAPPY WHILE DOING IT, by A. I. Root. Herein doth our old friend give some practical ideas about making a living independently around one's own home. It suggests many ways of making a living for men with little capital. With GLEANINGS for a year and this book the charge is \$1.35.

**Offer No. 6B.** A copy of MINK-TRAPPING, and GLEANINGS one year, \$1.50. The methods as published are those of experienced trappers from all parts of the country.

**Offer No. 7B.** A copy of FOX-TRAPPING, and GLEANINGS one year, \$1.30. A book of instructions telling how to trap, snare, poison, and shoot. A valuable book for trappers.

**Offer No. 8B.** BEE GLOVES. one pair cloth bee-gloves, with or without fingers, with GLEANINGS one year, \$1.35.

**Offer No. 9B.** One F. F. FOUNTAIN PEN No. 2, with GLEANINGS one year, \$1.50.

*The above prices are all postpaid.*

Canadian postage on each of the above offers, 30 cts. per year extra.

Foreign postage on each of the above offers, 60 cts. per year extra.

## THE A. I. ROOT COMPANY, MEDINA, O.

# A TRIFLE OFF IN COLOR AND A SHADE LOWER IN PRICE

Late last fall we added another apiary to our series of out-yards in Northern Michigan. It was a magnificent raspberry location, and we supposed that region entirely free from other honey-producing plants; but when we came to harvest the crop this fall we found that the honey was not strictly water-white. The color could not be detected in a small quantity like a spoonful, or even a saucerful, but by filling a glass fruit-jar or pitcher, and holding it up to the light, a very slight reddish or pinkish tinge can be noticed.

Probably 99 in every 100 pounds of this honey are pure raspberry. We certainly can detect no difference in the taste or flavor between this honey and the strictly pure raspberry, and we presume not one customer in a dozen would notice the slight color, unless he had the two kinds side by side and some one called his attention to it, but we don't propose to send out any honey as strictly pure raspberry unless it is such. We have put

up the honey in 60-pound jacketed tin cans, and offer it at \$5.50 per can—75 cents less than we get for the same amount of the water-white, strictly pure raspberry. If you don't care for the slight trace of color you can save 75 cents in buying a 60-pound can.

If you would prefer to see a sample before ordering, send ten cents and we will mail you one with pleasure, and the ten cents may apply on the first order you send. Ask for a sample of the "slightly-colored" raspberry honey.

We can still furnish the strictly pure water-white raspberry honey at \$6.25 for a 60-pound can, or \$12.00 for 120 pounds.

All of our honey is thoroughly ripened, thick, rich, and truly delicious—a cent or two extra on the pound does not cut much figure when it comes to the eating.

**W. Z. HUTCHINSON, Flint, Mich.**

## HONEY-JARS from New York City

We consider the No. 25 jar with solid metal cap and waxed liner the best jar made for honey.

Gross crates . . . \$5.00; 5 gross, \$4.75 per gross.

12-oz. screw-cap jar . . . 4.50; 2 gross, 8.25 per gross.

1-lb. sq. jar with cork . . . 5.00;

Italian queen . . . 1.00. Catalog free.

Apiaries, Glen Cove, L. I.

**I. J. STRINGHAM 105 Park Place, New York**

## Fashion Book Free!

I want to send you my handsome new book showing over 400 of the latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for 5 cents each. They are the same patterns you have always paid 10c and 15c for at the stores, made by the same people, and correct in every detail.

### HOW I DO IT.

I publish **The Home Instructor**, an illustrated woman's magazine and I want your name on my subscription list. **The Home Instructor** is bright, entertaining, clean and instructive—just the sort of a paper you should have in your home. It has departments for every feature of home life, and prints the choicest fiction every month.

Every issue has several pages devoted to the latest fashions, fully illustrated.

### My Special Offer.

Send me 25 cents and I will send you **The Home Instructor** for two years and will send my big fashion book to you free. I will also agree to sell you any pattern you want thereafter for 5 cts. I can sell them for 5 cents because I buy them by the thousand and don't make any profit. I don't want the profit, I want your subscription to **The Home Instructor**. You will save many times the cost of my offer in a year. Write to-day **A. OTIS ARNOLD, Dept. B Quincy, Ill.**

### "BUILD NOW."

There has been a campaign quietly going for some time which has for its title the above words. The meaning is obvious. At the present time the price of building material of all kinds is considerably lower than a year or more ago. It is not likely prices will go lower. The chances are all in favor of the price going higher, so that the advice to "build now" is sound and good. From all over the country advices have come that many are acting on this suggestion. Even large factories are being built under the idea that it will be much cheaper to build them now than later on when roseate prosperity has resumed its sway.

If everybody who has any need of building would take hold of the idea, "build now," it is only a matter of time when we should have prosperity of the most pronounced kind, as the building trade is the basis of many others. It requires the exercise of only a very small amount of faith to see that this country will continue to grow and expand as fast as it ever did in years gone by. All experts are agreed the check is only temporary, and that the *status quo* will soon be restored. When it is, prices will be considerably higher than now. The wisdom of building now will be apparent.

What adds weight to this advice is the new departure of the famous firm of Gordon, Van Tine Co., who have brought the methods of the great mail-order houses of Chicago to bear on the planing-mill business. You can now buy every thing necessary for a nice house in the same way you can buy groceries and clothes by mail. The net result of this is that the consumers save the profits of the middlemen and retailers. Nor is this all, for the buyer gets a much wider selection than if he purchased the goods at a small mill. The modern housekeeper wants something more than a shed for a home, even if she lives in the country; and almost the only way for many to get what they desire in house-building materials is to order from a mail-order house like the Gordon, Van Tine Co., Davenport, Iowa. They issue a large catalog of house materials so that any one can sit down and quietly figure for himself the cost of any building desired, be it a chicken-coop or a mansion. The signs of the times all point to this kind of enterprise being a success. Tremendous efforts have been made to crush this new way of doing business, but to no purpose; and on account of lower prices it *must* succeed. The logic of low prices can not be resisted, even by those who profess not to patronize mail-order concerns. This being so, we advise them to write for the Gordon, Van Tine Co.'s catalog at the earliest opportunity. See if these things are so.

## Killing Two Birds With One Stone

*By the Bee Crank*

You accomplish two things by ordering your supplies of me now, providing your order is accompanied with the cash.

First, you save six per cent on the cost if ordered in October; five per cent in November, which, for the short time between now and the time you must have the supplies, means 12 to 15 per cent per annum on your money.

Second, and most important, when you are in need of your supplies they will be ready for you.

Most bee-men are not fond of writing letters. They delay ordering until the last minute, and frequently still later, and then are in a terrible rush for the goods. When about 75 per cent of my patrons do the same thing you can readily appreciate the scramble that ensues at

this end of the line to keep from breaking my record.

Please remember that this is a special season discount, and not a concession because of any thing doubtful about the goods or the quality. The supplies are all fresh, clean, and the highest Root standard.

You should have my catalog. A postal will bring it. If you will send me your name I will place it on my mailing-list and

send you from time to time notices regarding any thing new that would interest bee-men.

If your demand for honey exceeds your supply, write for my quotations. I carry a large stock of finest quality, and it might be to your interest to keep your trade supplied.

Save your beeswax—I pay 28 cents cash or 30 cents in trade.

**Walter S. Pouder,**  
**513-515 Massachusetts Avenue, Indianapolis, Ind.**

## TELEPHONES FOR ALL.

Every farmer knows the value of a telephone. It unites him and his family with the outer world. Many are the benefits which come from their use—so much so that a community can hardly call itself civilized in the best sense of the word unless it has an established phone system. Where all club together and unite their energies the cost is not great—in fact, infinitesimal in comparison with its benefits from a social and business point of view. For one thing, an efficient telephone line is a sign of progress and enlightenment.

The presence of a telephone system in a locality is a great promoter of business; it gives strangers a much better impression of your enterprising spirit and it promotes social intercourse and otherwise binds people together as nothing else can. It is a protection against burglars, criminals, and tramps, and it is well known these gentry are afraid of a telephone system. Many have been caught by its aid. In time of sickness a telephone is an immense benefit and a great comfort. During storms it is also a power for good. It is often used to warn people of rapid changes in the weather, and in a multitude of ways is a great comfort to a family. Hardly any one can be found to dispute its value nowadays.

There are many localities, however, where, from the want of some progressive person, or the lack of information, a telephone exchange has not been installed as yet. We want to have a word with just such people. We wish to point out the fact that there is an easy way of getting what you need—a simple, cheap telephone system with only a moderate effort, and no special knowledge of electricity on your part. The Stromberg-Carlson Co., Rochester, N. Y., who manufacture phones and all necessary supplies, will show just how to go about it so you will have no difficulty whatever in mastering the whole problem. They have all the latest ideas on the subject, and can tell you just what to do, even if you are a perfect novice. They put up hundreds of systems in the course of a year, and, of course, know just how the promoters go about their work. Many go by their advice entirely. All you have to do is simply to keep in touch with the managers of the Stromberg-Carlson Company, who will keep you posted. If you absolutely don't know a thing about it, just write them to that effect, and they will at once proceed to coach you. In a short time you will know all about it—at least, enough to buy all the material, put it up, and manage the exchange. Many people have done this, so there is no doubt about it. If the men folks are too busy the women can do all the work except putting up the line. That is, they organize the company, buy the material, and conduct the exchange. If a telephone line is needed in your locality we heartily recommend you to write at once to the Stromberg-Carlson Telephone Co., Rochester, N. Y.

## SEABOARD AIR LINE RAILWAY.

As usual the Seaboard Air Line commences the fall campaign by putting its fall advertisement elsewhere in this issue. It is one of the great railroad systems of the United States, embracing the States of Virginia, North Carolina, South Carolina, Georgia, and Florida. Despite the fact that these are old settled States—far older than Ohio, Indiana, or Illinois, there are still large areas of land untouched by the plow, or which are imperfectly cultivated. Some of this land can not be excelled in fertility; and the climate being exceedingly pleasant, and the markets close at hand, there is presented a unique opportunity for farmers, gardeners, and others to acquire a competency. Naturally the railroads would be benefited if the country were more thickly settled, and this is the object of their propaganda. They want settlers of a certain kind—men who know how to farm intensively in growing truck and fruit, and in dairying, etc. Large numbers of Northern people have settled in the South, chiefly as market-gardeners. They grow large quantities of garden-stuff for shipment to the North early in the spring. They also grow immense quantities of strawberries and peaches.

It must not be supposed from this that these are the only industries open to Northern enterprise and capital. Raising hay, dairying, horse-raising, etc., are more profitable than usual, on account of the fact that the average cotton-planter buys from the North all his food supplies, his horses and mules, and even the food to feed the latter.

There is an idea among Northern people that the climate is too hot, or is too unhealthy, whereas it could hardly be better. The heat is never so oppressive as it is in the Mississippi Valley, and the winters are just cold enough to set vegetation to rest. Beautiful apples, pears, peaches, plums, grapes, strawberries, figs, etc., can be raised, and with greater certainty than in the Northern and Central States. Fine crops of wheat and oats can be raised; and as for corn, South Carolina has repeatedly beaten every other State in the Union in contests for the greatest yield of corn per acre.

To set at rest some of the erroneous ideas pertaining to the South and its possibilities the Seaboard Air Line is offering very low rates to homeseekers who desire to visit the South to look around and see for themselves the conditions. The managers think this will be convincing, and hope to secure a great many permanent settlers who will help to build up a white man's paradise. The South has made great progress, especially along the lines of education and temperance, within the last few years. Better go and see. The round-trip rates are cheap and attractive. The railroad also maintains a bureau of information at Portsmouth, Va., with Mr. John W. White as the manager. Write to them for all particulars. They are at your service.

# FROM A PACIFIC-COAST ADVERTISER.

It is no news to us that a firm in California finds it profitable to use our pages; but that you may see how we are regarded by a well-known agency and their clients, the California Fruit Product Co., we reproduce their letter below:

## "Practice Makes Perfect."

A little girl sat on her father's lap, looking into the mirror, and inquired if God made both her father and herself. Being assured that he did she remarked that he was doing better work than he ever did before.

It is simply the old adage over again, and it is true of *The A. I. Root Co.'s* Bee-keeping Supplies; and while perfection can never be attained they are as near perfection as improved machinery and years of practice can well make them. If you have never seen them, or if you have, and have not a catalog, send at once for my 40-page catalog, illustrated profusely, and giving prices of every thing used in the apiary. *It is free for the asking.* Special price list of shipping-cases, and all kinds of honey-packages—wood, tin, and glass. Send a list of what you will need at any time and let us tell you what they will cost you delivered at your station.

*Cash or goods for wax at all times.*

## STRAY STRAWS

DR. C. C. MILLER

HAHNEMANN, the aged bee-keeper mentioned on page 1186, is, if I mistake not, the inventor of the queen-excluder. Going from Germany, he has been in Brazil many years.

E. D. TOWNSEND, I was a little surprised that you didn't mention dandelion in your list of honey-plants, p. 1185. It was introduced here perhaps 60 years ago, and now it is worth more than all early yielders combined, leaving out fruit-bloom.

"TIMELY HINTS on fall uniting," p. 1178, are good. Let me add that, if you kill one queen two or three days before uniting, then move the queenless bees to the hive with the queen, it will ensure the safety of the queen, and the queenless bees will stay put better than queenright bees. [Correct, according to our experience.—Ed.]

A. I. ROOT, you seem to think, p. 1209, that if you have your money in government bonds you can't get it just when you want it. That's true, and it's not true. You can get the money for a government bond any day, but you must sell the whole bond at once. If you want only a small part you can't get it. There's where postal or savings banks are ahead.

THE SEASON was somewhat disappointing at the latter end, owing, at least partly, to the drouth of 43 days. Still, I'm not grumbling. An average of 151 sections per colony (about 138½ lbs.) is not bad. The best colony gave 276 sections, falling 24 sections short of the best yielder in 1903. [Now we are curious to know how many colonies you had, or, in other words, what is your total crop?—Ed.]

A. I. ROOT, speaking of preparing wheat cheaply for the table, p. 1213, did you ever try it with no preparation whatever except to boil the whole wheat? In college days it was a staple article with me, and I assure you a peck of wheat will go a long way. Boil it three hours. A good medicine for constipation. Cheap, too. Some of the time my board cost 35 cents a week. But I don't hanker to repeat the experience.

YOU ASK, Mr. Editor, p. 1176, "Do you think there is any real difference between boiling the splints in the hot wax and covering them over with a thick film of wax as described by Mr. Atwater?" No, indeed; I think the Atwater plan might be the better, if thoroughly done. I have been wondering whether it might not be just possible that one reason the bees gnawed Mr. At-

water's foundation was because the end of the splint was some distance above the bottom-bar.

W. K. MORRISON, your levulose-dextrose business, page 1205, is interesting. Now when I've had coarsely grained clover honey I've drained off the liquid part, leaving apparently dry sugar. Is the liquid drained off mostly or entirely levulose? If so, we might so control the granulating as to get all the levulose out. [The drainings are pure levulose and water. If held at the right temperature the levulose leaves the dextrose as a liquid. The dry sugar is pure dextrose. In time there may be a demand for this levulose, as it is undoubtedly a medicine.—W. K. M.]

M. H. MENDLESON, you're perhaps the first Californian who has mentioned getting a crop of phacelia honey, although I've implored some of you to tell us about it. It is a native of California, introduced from there into Germany, and much has been said in German journals about it; but your brief mention of a carload of honey from it, p. 1203, comprises a large part of our literature on the subject. What's the honey like? What is the value of phacelia as forage for cattle? Was your honey got from wild or cultivated plants? Please unlock your knowledge-box.

POSTAL SAVINGS BANKS will be a great convenience, and entirely safe, splendid for temporary deposit; but other savings banks will still be needed, for two per cent is all that is proposed the postal shall pay, and it is right that money should earn more if it can do so safely. There is considerable discussion just now about having laws that will make savings banks as safe as government bonds. Indeed, Oklahoma already has such a law, and you can send money there by mail and get 4 per cent. That's about as much as you can get from banks anywhere. In this locality, 3 per cent is the rule.

WM. W. CASE says, p. 1199, that the larva of the bee-moth makes its start in cells of pollen in sections, and in travel-stain. He might add that the body of a dead bee also makes a good starting-point. But with Italians or good hybrids, do worms trouble sections? For years I haven't fumigated a section, although, before Italian blood predominated, all sections were fumigated twice. [We find it necessary to fumigate some lots of sections that are sent to us. We presume it is because the producers of them have the bee-moth in their vicinity. Come to think about it, we do not have to fumigate combs from our yards as we did in years gone by.—Ed.]

"THESE OLD QUEENS are always readily accepted anywhere," page 1204. That sounds as if it meant that an old queen would be more readily

accepted than a younger one. If Mr. Beuhne really means it so, I will believe it, although I have always supposed it was the other way. [We feel sure that Mr. Beuhne meant by "these old queens" those that were at least three years old. The idea, as we gathered it, was that they must be so old that the young queen would consider that they had about outlived their usefulness. Perhaps the bees take the same notion, and hence they tolerate them more freely in a strange colony than they would a laying queen less than a year old.—ED.]

UNITING, in this locality, is done mostly after this fashion: One colony (preferably queenless) is set over on the other, on the stand of the under hive, a sheet of newspaper between the two. The bees will eat a hole through the paper, and slowly unite without fighting. The short imprisonment over the paper helps to prevent any returning to the old stand. A few days later, extra frames are removed and only one story is left. [You have hybrid bees, and it is probable that it is not advisable to let them get together immediately; hence the use of a sheet of paper to keep them apart a day or two. But with the ordinary pure Italians we never find it necessary to use any thing.—ED.]

J. E. CRANE, p. 1121, questions my estimate of 5 lbs. of comb to contain 100 lbs. of honey. Friend Crane, I quoted that from memory, as one of the many things I had learned from the first volume of the *American Bee Journal*, year 1861. Upon reference, however, I find that memory tricked me, for on page 282 I find: "It takes about  $\frac{1}{2}$  lb. of comb to hold 15 lbs. of honey." Also: "One pound of honey contains about 20 cubic inches;" and I got the figures mixed into "One pound of comb for 20 pounds of honey." Half a pound of comb to 15 of honey makes  $3\frac{1}{3}$  pounds of comb to 100 pounds of honey, which is not so very far away from your estimate of 4 pounds. Thanks for correction.

ALBERT I. MILLS asks whether foul-broody honey is fit to eat, page 1208, and is told that the germs are not injurious to a human being. I suspect that he, like a good many others, is not so much interested as to its wholesomeness, but wants to know about its cleanliness. I think there prevails more or less the idea that anything connected with such a filthy disease must be utterly unfit for human food. A larva dead with foul brood is certainly a loathsome object. Any one who has smelled it would gag at the thought of having it mixed in his food. But it does not follow that there is any thing filthy about the germs themselves. They are merely tiny plants, perhaps daintily neat, which, growing in a larva, cause the death of that larva, and then the larva putrefies and becomes offensive. It's the dead larva that's objectionable, not the germs themselves.

#### THE COLOR OF HEARTSEASE HONEY.

My clover crop was 25,000 lbs.; heartsease and fall crop not off. I think Dr. Miller mistaken as to color of heartsease honey, as it is lighter than buckwheat instead of white, as he states.

D. E. LHOMMEDIEU.

Colo, Iowa, Sept. 14.

## EDITORIAL

By E. R. ROOT.

### HONEY MARKET MORE STABLE; SHIPPING COMB HONEY IN COLD WEATHER.

THERE is not much new to report in regard to the honey market except that it seems to be more and more stable. It is to be hoped that most of the stock will be unloaded before the holidays; at least, the carload shipments should not be on the rail after the cold freezing weather sets in; small lots should be in the hands of the dealer. Honey will stand considerable cold for a short time, but it should not be subjected to it too long.

### SHALLOW VERSUS DEEP EXTRACTING-SUPERS.

MR. SCHOLL presents elsewhere some good arguments in favor of a shallow frame for extracting purposes. We have been experimenting along the same line during the past summer. At our south yard we produced several thousand pounds of honey in shallow frames. These shallow supers are just right to put on colonies of moderate strength, and they are just right to give room *gradually* on the tiering-up plan. To give the full standard-depth super at one time is too big a jump at once, and, moreover, it is awful heavy to handle when full of honey. We say "awful," because no other word seems to describe fitly one's feelings when he is lifting these heavy loads, especially if he keeps it up all day. The tendency is more and more toward shallow supers for extracting, and we believe there is good reason for it.

### HONEY-KNIVES WITH STRAIGHT HANDLES VERSUS THOSE WITH THE OFFSET HANDLES.

ELSEWHERE in this issue Louis H. Scholl says he prefers and uses a *straight* butcher-knife in preference to a standard uncapping-knife with an offset handle. We desire to inquire whether others have used knives with the handle in the same plane as the blade. If so, please tell us about it.

It sometimes happens that one man will set the pace for a certain style of tool, and all the rest will follow suit, never thinking for a moment that the shape of a tool could be changed to any advantage. Is it possible that a knife with a straight handle is better on plain work, saving strain on the wrist, than one having a handle an inch or more out of the plane of the blade? But the user of the standard knife will say, of course, that we must have the crook in the shank in order to get down into places that can not be reached with a standard butcher-knife. We arise to inquire whether that is absolutely so. Possibly it might transpire that one might be able to use to advantage a straight-handled tool on plain work and another knife, with an offset handle, in places which can not be reached with the straight knife. We should like to have a discussion of this question in these columns. Surely there are many among our readers who have tested both kinds of knives.

### SYRUP FOR WINTER FOOD.

IN feeding bees for winter we advise granulated-sugar syrup made by mixing two parts of sugar to one of water by measure. We formerly recommended equal parts of each. While this is

just right for stimulating in warm weather, for a winter food it entails too much work on the bees to evaporate out the excess of water. This has a tendency to exhaust the vitality of bees. If the feeding be deferred until quite late, or until the temperature is much of the time down to freezing or below, we would advise the proportion of three parts of sugar to one of water; but in that case we would recommend putting in about one pound of good honey to twenty pounds of syrup to prevent granulation.

But some will ask, "Why not feed honey?" A good article is too expensive, and a cheap honey dear at any price if we consider winter losses. There is no reason in the world why one should not give a cheaper and better feed for winter, and sell the article that the bees produce, at a figure that is twice that of the cost of the syrup. So long as we do not take this thick syrup out of the hive and sell it for honey, we are in no sense defrauding the public.

#### GENERAL PREPARATIONS FOR WINTERING; WHEN TO USE THE CELLAR OR THE OUTDOOR PLAN.

It is now about time when the bees should be fed for winter. A month hence, in most localities, they will need to be in their cellars or winter repositories where the winter is cold enough to be below the freezing-point most of the time. If they are not put into cellars they should be put into double-walled hives or winter cases. Where the winters are very open, and seldom any freezing during an ordinary season, single-walled hives outdoors will usually afford sufficient protection; but even then we advise shielding the apiary from the prevailing winds, and contracting the entrances down to about half, or less than their usual capacity.

But suppose we have had heavy losses outdoors, or suppose, as is more often the case, we feel that we can not afford to buy double-walled hives, and are somewhat doubtful about the efficacy of paper winter cases—how shall we winter indoors? If one has only fifty colonies he may use a compartment of the house cellar providing it is dry and the temperature can be kept so it will not go above 60° nor below 40°. If the cellar can be darkened, and fresh air admitted throughout the winter, good results will usually follow. If there be a furnace in the cellar, and the bees are shut off in a room by themselves, the conditions will be good providing the furnace does not make the bee-room too warm. A high temperature can be tolerated for a limited time if there be plenty of fresh air from outdoors; but if it is possible to maintain a temperature of 45° or 50°, with some ventilation, the results will be much better.

Some advise leaving the bottoms of the hives off entirely; but our experience is strongly in favor of leaving them on. Some have had splendid results using the entrance as in summer, and placing a quilt over the frames, with covers removed. This allows for a certain amount of upward ventilation and the escape of moisture.

One should bear in mind that a small number of colonies in the cellar will do very much better than a large number. The presence of too many bees befouls the air, and is apt to raise the temperature of the cellar too high. Ventilation intelligently practiced will overcome this to a very great extent.

#### WHEN TO WINTER OUTDOORS.

As a general thing, where the temperature out doors does not go very much below 20° above zero most of the winter, and remains at zero for only two or three days at a time, much the best results will be secured from outdoor wintering. This is especially true where there are a good many open fly days, when the bees can go out and return to their hives. But at such times there is likely to be considerable loss if there be snow on the ground at the time, as many bees will be chilled, never to return. This flying-out can be obviated to a certain extent by leaning a board up in front of the entrance, to shut out the sunlight, and yet not obstruct free ventilation; but a real bright day will bring out the bees in spite of this storm-door board.

Winter cases may be relied on to do good work providing a good thickness of newspapers, quilts, sacking, or some sort of packing material be interposed between the paper case and the hive itself. One can usually get old sacking by going to the feedstores, and at a very moderate price. This, in connection with what newspapers one may have, will provide a good warm packing around the hives. A fair grade of manila paper or flour-sacking is good for winter cases. But this should be painted with linseed oil before it is folded up into a sort of hood around the sacking. It should then be tied, or, better still, the bottom edges be secured with wooden strips held on with nails.

For outdoor-wintered colonies we recommend about 25 lbs. of sealed stores. It is advisable to allow the bees to make their winter nest in the midst of these stores. For indoor colonies we consider 12 or 15 lbs. sufficient.

But perhaps the reader will ask, "Why not winter indoors, and save this 8 or 10 lbs. per colony of stores?" But those who winter outdoors argue that this extra consumption means more bees in early spring, and therefore a larger harvest for the season, so that it is not clearly proven yet that the extra outdoor consumption is not more than made up by a larger crop of honey during the honey-flow.

#### WHY THE BUYERS AND COMMISSION MEN PREFER SQUARE CANS TO BARRELS FOR EXTRACTED HONEY.

THE following letter came from Dr. D. Everett Lyon; and as it touches on this general subject of shipping extracted honey in cans and barrels we thought best to present his letter so we might discuss its contents in this department:

*Mr. Root:*—In your columns you have overlooked a subject which constitutes a gross injustice that is being done the bee-keeper, and I think it about time that we banded together and took some action looking to putting a stop to it.

I have noticed lately that many commission men, and other buyers of honey for bottling, almost insist that the honey-producer shall send his extracted honey in 60-lb. cans for the convenience of the fellow who bottles honey.

Now, this is all right as far as it goes; but I do think the buyer of honey has an awful nerve to advertise these cans for sale at, say, 25 cts. apiece when the honey-producer isn't allowed a cent on the cans, even when he at considerable expense provides nice new ones.

Wouldn't it be fair for the buyer of honey to allow the producer half price on the can, especially when the buyer sells them second hand? What do you think of it?

Rye, N. Y.

D. EVERETT LYON.

So far as we know, it is the prevailing rule among commission men and honey-buyers to

offer a certain price for extracted honey, that price being based upon the kind of package which is always included at the figure. It is customary to pay half a cent more for honey in 60-lb square cans, two cans to a case, than for honey in barrels, although some dealers say that they would prefer to pay a cent more than have barrels. In basing the price it is understood in each case the cans are to be new, and the barrels new, or as good as new. Honey in second-hand square cans is likely to be shaded somewhat in price. Such cans are often not worth much. After they have been emptied they are usually banged around, are likely to leak, or are more or less soiled or rusty; and, what is more, they must be thoroughly cleaned. Many producers believe that it is "penny wise and pound foolish" to buy up second-hand square cans, even if they can be had as low as 30 cents a case, which means, of course, cans at 15 cents each, case thrown in. The cost of cleaning, inspecting, etc., runs the price up. Then there is the increased hazard of honey leaking from them. They never look as nice as brand-new cans, and the dealer may knock off a quarter or half a cent per pound on honey on arrival.

But what has all this to do with your question? If what we said is true it shows there is a limited demand for second-hand square cans. When they are offered, the very best of them, at 30 cents, when brand-new ones can be had for 80 cents, or much less in quantities, it is folly to buy cans at 30 cents per case, pay freight on them, wash and clean them, inspect them to see if there are any leaks, sandpaper the rust off the can, and then, on top of all, take the chance of leakage and of the dealer knocking off a quarter of a cent from the price of the honey. With these facts before us you can readily see that a good many don't want them. If that be true, no commission man nor honey-buyer can afford to make any offer on the cans after they are emptied. In the case of the commission man and the average honey-buyer, the honey is resold and reshipped in the same package before it actually reaches the retailer or bottler; therefore it means this: It is only the latter who have any second-hand square cans as a rule, although the commission men are bound to have a few on their hands; but after these empties have been banged around in the warehouse until a sufficient number have accumulated to warrant offering them for sale, the great bulk of them will be a poor lot indeed, and we have heard commission men say that, as city rents are now, it does not pay to store them.

But now suppose Mr. Honeybuyer does store them, and he offers them at 30 cents a case. After he has shipped them he is quite likely to have complaints on the ground that they were *worse* than second-hand—good for nothing. The whole point hinges right here: If the buyer or commission men could absolutely *know* that the cans would come in good order, and if he could know that he could sell them again without storing, he could afford to offer an allowance, say half a cent a pound, on the price before the honey is actually shipped; but when he buys of Tom, Dick, and Harry, how is he going to know that the cans will arrive in any such good condition? As a matter of business and common honesty he had better make no promises.

So far we have not taken in the whole scope of your letter. You complain that Mr. A. buys your honey in square cans at a certain figure; then he insists that the honey shall come in square cans, as he will not have it in barrels. Then he turns around and offers to sell these cans for 25 cents each. This, by the way, is a very high price, and we doubt if he could get it. From a legal point of view Mr. A. has a right to sell these cans for whatever price he pleases. But is there any dealer at the present time who is offering to sell second-hand square cans at 50 cents per case, box thrown in? If there are any such, we have not seen it. But we know of their offering them at 30 cents per case, and this price is very low. We question whether, at this price, it would pay to store them.

Now having presented the arguments against the use of second-hand cans, let us see what may be said on the other side of the question. It is undeniable that a large amount of western honey is to-day sent in cans that have been used before. It is also true that a good part of such honey goes through in good order; but the facts are, the cans holding such honey, though second-hand, are practically as good as new; because in their first use they have not been sent a long distance. Or the cans may have been used for storage, and after a year of such usage would hardly pass for new. These would be just as strong, and practically as good as new for shipment. But after the cans reach the middlemen of the East they are usually dear at any price.

But why not use barrels? They cost less than half the price of square cans. Many and many have been the troubles from barrels leaking, and from honey having an unpleasant odor imparted to it, especially those in which alcohol or whisky has been used. We know of cases where honey shipped in a whisky-barrel took on very strongly the flavor of whisky. We have also known of the alcoholic flavor being imparted in like manner from alcohol-barrels. But that is not all. Not a small percentage of the honey soaks into the wood, and is lost. But some one may say that if the barrels are paraffined or waxed inside there will be no bad flavor imparted and no absorption of the honey by the wood. Y-e-s, and no. Some whisky-barrels will transmit the odor through the paraffine.

But another objection to barrels is the fact that the dealer can not reship from them in small quantities. A fifty-gallon barrel of honey weighs approximately 600 lbs. or 550 lbs. without the barrel. It would take a little more than four cases of honey put in square cans to equal the same amount. But the consumer or the grocer will order only a small quantity at a time. If the honey be in barrels the dealer must draw off in some small package. If the honey is in square cans he can break up the shipment without messing, and in the end he has saved time and money. He pays the producer half a cent more per pound for the honey because it is in tins, and he can now parcel out the entire shipment in small lots without any messing or waste of time.

Now, it may appear from all this that we are working for the commission man and buyer in general. We are only stating the facts as we know them. As it is an important subject, we invite discussion from both producer and dealer.

## CONVERSATIONS WITH DOOLITTLE

### OUTDOOR WINTERING.

"I must winter my colonies out of doors this year, as it is impossible to do otherwise. Will not a slight protection to the hives enable me to do this?"

"A slight protection may be all right, and possibly best for Illinois, Indiana, Ohio, or Pennsylvania; but in this colder climate of Central New York the heat of the bees alone must be depended upon for warmth; and any plan of outdoor wintering which we may adopt must conserve the heat as much as possible. The place is sheltered partially or wholly by woods, which will allow the sun to shine in, though keeping off the prevailing winds."

"I have a place where I can put the bees for winter where there are woods on the west and south side, so that no wind will touch them except from the north or northwest."

"Such a place as that will be much better than most bee-keepers have, for this will allow the bees to fly, many times, when they ordinarily could not; for, more often than otherwise, when it warms up enough during winter so the bees can fly, a strong south or southwest wind prevents, as the wind nearly always blows from those directions every time the mercury rises to 40 or 60 degrees during December, January, February, or March."

"How much packing would you use?"

"When I wintered bees out on their summer stands during the '70's and '80's I did a lot of experimenting to find out just how thick the packing should be to give the best results; and the conclusion I arrived at when using chaff or sawdust was that five inches was the nearest right. The bees were entirely surrounded, except at the entrance, with this chaff."

"I can get dry sawdust, cut from kiln-dried lumber, and very fine. How would that do for packing?"

"It does very well, but I think it is a little more likely to get damp and soggy during winter than the chaff. I have used sawdust for years, side by side with the chaff; but my experience was in favor of dry timothy chaff, as we used to have much of that kind of chaff at that time when nearly every farmer raised his own grass seed."

"But that can not be obtained now. Some tell me that where a double-walled hive is used, a dead-air space between the two walls is better than a space filled with either chaff or sawdust. What do you think of such a claim as that?"

"My experience has been that the bees did best when the packing was used. In my later outdoor wintering I used wheat straw for packing double-walled hives, and I found this far better than an empty space, and quite a little better than either timothy chaff or sawdust. Those who argue for no packing tell us that a dead-air space is preferable to a solid wall for keeping out either heat or cold; and that when we pack a dead-air space with either chaff or sawdust we make, in a measure, a solid wall of it. Now, by using the coarse wheat straw for packing we cut

up, so to speak, that solid wall into hundreds and perhaps thousands of little dead-air spaces, as each straw is a dead-air space of itself. And we not only have these hundreds of dead-air spaces, but the spaces surrounding and between the straws are so shaped that all moisture, which always accumulates more or less between the walls of a hive during winter, passes off into the open, and thus our colony of bees is not only very much helped about retaining its warmth, but they are kept dry and comfortable. This was the way I wintered all of my colonies which were left outdoors during the later '80's and early '90's. Since that time I have favored cellar wintering, not only because of the better results but for the great saving in stores."

"Did you entirely surround the colonies with this straw except the entrance?"

"Yes."

"How did you fix the entrances?"

"By making a flue, runway, or bridge from the outside to the interior, about 5 inches wide by  $\frac{1}{2}$  inch deep."

"Did you have any trouble about the bees coming out on bright sunshiny days during March or earlier, when the air outside was too cold for them to fly, after they left the warm hive, so that many would get lost on the snow upon taking wing?"

"Yes, to a certain extent; but bees are not enticed out of double-walled straw-packed hives to nearly so great an extent as they are from single-walled hives. The trouble can be pretty much done away with by leaning a wide board up in front of the entrance, standing the lower part on the alighting-board out four or five inches from the entrance, and allowing the upper end to rest against the front of the hive."

"But this would have to be removed every time there comes a warm day so the bees could fly."

"Not necessarily. It can be overcome by cutting out from the bottom of this board a piece the size of the runway, which goes from the entrance to the interior of the hive."

"But will not this allow the sunlight to enter the hive?"

"Not the direct rays of the sun, as they strike this board and are thus kept from coming near the entrance of the hive. When the bees come out at the entrance they are in the shade till they pass over the space made by this leaning board; and this space being as cool, or nearly so, as the outside air, they will turn and run back into the hive unless the air outside is warm enough for flying in safety, except, perhaps, a few bees that are ready to die of old age, or when the bees are wintering so poorly from some cause that they must get out to empty themselves or soil the combs and the inside of the hive. There is more in this vestibule than some imagine. Suppose we should leave the doors of our houses open all winter, as most of the entrances of bee-hives are left, I think we should have hard work to keep warm in spite of our warm fires. We not only close the doors, but most of us have a storm-door over the outside door, that but little cold may get in when the inside door is opened. When a hive of bees is completely surrounded on all sides with several inches of dry dead-air spaces, and a vestibule over the entrance, each

colony is protected to the extent of making each hive into a little cellar by itself as nearly as possible.

Borodino, N. Y.

## GLEANINGS FROM OUR EXCHANGES

By W. K. MORRISON

### TROUBLE OVER A BEE-TREE.

The honey crop of Indiana must be very short this year or there must be a tremendous demand for the sweet of the gods. Any way, Orlando Norris, of Sullivan, Indiana, got shot almost to death in defending a bee-tree on his father's farm. Andy Price and two other men are in jail in consequence. They went in the night time to collect the honey, and succeeded in cutting down the tree. This awoke the farmer and his sons. In the altercation which ensued, one of the sons, whose name is given above, got shot in the side. Men will do almost any thing to get honey—in Indiana. A similar case occurred in Ohio this fall. One man got killed.

### THE RIGHT SORT OF MAN.

In a recent issue of the *American Grocer* the editor had the following to say of Dr. Wiley:

That sturdy chemist who has been at the head of the Chemical Division of the Department of Agriculture for over twenty-five years is a bachelor with the right sort of stuff in him. He has been fought in every way. Men have tried to neutralize his work, and bands of men and great corporate interests have tried to defeat his plans to give the people a national pure-food law that would be effective and preserve the integrity of the food supply. He has been abused, lied about, ridiculed, but he never loses his temper, keeps good-natured, and quietly keeps at work as the whisky-blenders have recently learned. The President may question his policy; the Secretary of Agriculture negative his rulings; commissions of experts may be appointed to test decisions; the press may praise or howl for removal; but defeat is a word Wiley hasn't learned to spell. The first International Congress for the Repression of Adulteration of Alimentary and Pharmaceutical Products at Geneva, this year, made him its honorary president, as he was detained from attendance. If Wiley had become discouraged, resigned, and given up the fight, pure-food legislation would have been held back for many years.

### CAUCASIANS AT NEBRASKA FAIR.

The reporter for *Wallace's Farmer* at the Nebraska State Fair is a wide-awake man. He states:

The bee and honey exhibit is mostly made by dealers. Premiums are not large enough to attract many producers. A feature of this department was a lecture twice daily given, by Mr. F. G. O'Dell, on bees and bee-keeping. These lectures were delivered from a big hive in which was a swarm of bees, said to be "stingless." The stingless quality, however, was seriously questioned when the lecturer got somewhat stung up one day.

Nothing could be further from the truth than the statement that Caucasian bees are stingless, for they are well furnished in that respect—as well as any—and know how to use their stings when circumstances permit. Any one purchasing Caucasians for their stingless qualities is getting a gold brick. I remember when Cyprians were reputed to be quite mild in temper, and some of us took the bait—to our sorrow.

### THE LOCUST BORER VS. BEE-KEEPERS.

Some one can render a priceless service to the bee-keepers of the United States by finding an enemy to the insect which bores holes in the com-

mon black locust. According to all literature of the forestry experts employed by Uncle Sam this is the only drawback to planting the black locust on a grand scale. Many farmers would plant it quite extensively if it were not for the borer. This is particularly true of Ohio, Indiana, Illinois, Missouri, and Iowa; but a locust-grove is growing well near Denver, and there are many in Kansas. It is a splendid honey-bearer. It can not be termed a water-white honey, but the aroma or bouquet is fine. Though a rapid grower the wood is hard and very durable, and useful for many purposes. There ought to be a remedy for this trouble. We could, as a nation, easily afford \$25,000 to the man who can find a remedy. The honey-locust seems to be immune or nearly so.

### WATER IN HONEY; A FEW STRONG TALKING POINTS ON HONEY AS A FOOD.

Honey is one of the driest of human foods, as it usually has less than 20 per cent of water. Beefsteak, of the most expensive kind, contains 65 per cent, and even then there is some bone to be reckoned with. Some of our most expensive fruits and vegetables are nearly all water, 95 per cent and some even more! This is a point that bee-keepers can harp on a good deal. Anybody can easily see that, between a pound of steak at 18 cents and a pound of honey at 18 cents, the advantage lies with the honey. Moreover, honey will keep indefinitely, whereas beefsteak deteriorates in a few hours. Actually, honey improves with age. Add on to this the fact that honey is one of the very few predigested foods. In the United States to-day milk is the only food which compares favorably with honey, both as to quality and price. In some ways milk is far inferior to honey.

### THE FRENCH TARIFF ON HONEY.

The French Tariff Commission has decided that \$6.00 per 220 lbs. will be the maximum tariff on honey, and \$4.00 per 220 lbs. the minimum. This is far short of what the French bee-keepers desired; but I imagine that the Chamber of Deputies will ratify the views of the Commission.

In this connection it has been noted that the strict suppression of all honey frauds will do the bee-keepers more good than a high tariff. The government chemists will aid the bee-keepers in suppressing spurious honey. There are now laboratories belonging to the pure-food department at Paris, Amiens, Arras, Auxerre, Chartres, Bordeaux, Clermont-Ferrand, Dijon, Lille, Lyon, Montpellier, Nancy, Port-Vendres, Toulon, Havre, Poitiers, Reims, Rennes, and Tours. The prices of honey are no higher in France than in England, where there is no tariff, so that it is very likely that the pure-food officials can do the bee-keepers more good than the tariff commission.

### FOUL BROOD IN INDIANA.

The Indiana State Association of Bee-keepers is making a vigorous effort to have their State fall in line with the progressive bee-keeping states, and for this purpose have prepared a foul-brood bill which they will ask the legislature to frame into law. This law is much required in Indiana,

and every bee-keeper who expects to stay in the business should lend a helping hand. The committee having the matter in charge is composed of excellent timber; namely, Jay Smith, of Vincennes; George Demuth, of Peru, and Walter S. Pouder, of Indianapolis. These men can not do it all themselves; they must have public opinion behind them, and practical assistance when necessary. A certain amount of public spirit is required to make laws worth any thing, and there are plenty of good bee-keepers in Indiana who can be of service, if they will. They can have this law if they insist on it. Don't hang back and let some one else do all the work. Politicians require prodding or nothing is done. Sit down and write your representatives and senators that you expect them to vote for the bill appointing a State Inspector of Apiaries. Your letter will count for a good deal.

#### IRRIGATION IN PORTO RICO.

It has been decided by the insular government to spend \$3,000,000 on an irrigation project somewhat similar to those now being constructed in the United States. Porto Rico, though a small island (a little less than Jamaica), has a peculiar rainfall distribution. On the eastern end there is an enormous rainfall—120 to 150 inches per annum—whereas on the south and southwest the fall is so light as to render farming precarious. Irrigation will give the sugar industry very great encouragement; but whether that is a good thing or not depends on the point of view. It will certainly help the landlord class and the owners of sugar-mills; but industries like bee-keeping will not be helped—quite probably the contrary. It will create an army of poorly paid laborers who will live in barracks a hand-to-mouth existence, working to help the sugar trust. The life they lead demoralizes them. On the other hand, a band of small fruit, vegetable, and coffee farmers would build up the community. Bee-keeping in Cuba has been curtailed by the extension of sugar-cane farming. This is not so beneficial as might be thought.

#### HANDBOOK OF SOUTH CAROLINA.

Through the courtesy of Mr. E. J. Watson, Commissioner (Columbia), I have been favored with a copy of the *Handbook of South Carolina*. It is a large book of over 600 closely printed pages, containing many good illustrations. It forms a complete description of the Palmetto State. If any of the northern readers of GLEANINGS have serious intentions of moving to a milder climate I would earnestly recommend them to get a copy of this book. No price is attached, but doubtless the charge is nominal. As a field for skilled gardeners, farmers, and fruit-growers, South Carolina is not surpassed by any country in the world. On the coast there are old groves of oranges, trees which sometimes fruit, while up near the mountains splendid apples, grapes, and peaches are grown. Truck-growing is an immense industry along the coast. The greatest yield of corn ever known in this country was obtained in South Carolina, and its cotton is famous. It has not figured very largely as a bee-country, nevertheless much of it is well adapted, and Mr. Watson writes that white clover is being

scattered all over the upper portion of the State by agents of the United States Department of Agriculture. The immense cotton-mills, fertilizer-factories, lumber-mills, etc., furnish a splendid market. Education is well attended to, and railroads completely intersect the whole land.

#### APICULTURE IN SPAIN.

The editor of *Gaceta Apicola de Espana*, in the September issue, laments the condition of bee culture in Spain in very pessimistic terms. He says that, on many occasions, he has referred to the superior position of bee-keeping in Cuba, where the conditions are no better than in Spain. But he says the style of bee-keeping in Cuba is North American, not Spanish, thanks to the easy communication with that country. (The Spaniards usually term our country Norte Amerique.) In Cuba the predominating flower is the campanilla, which produces a very light rich honey, much sought after by foreign merchants who export it to Europe. He claims the honey of romero (rosemary), which is common in Spain, would compete with the campanilla if given an opportunity; but the amount of honey produced by the movable-comb system in Spain is relatively very small; whereas in Cuba movable combs are the whole show. This accounts for Cuban superiority, both as to quality and quantity.

The editor is correct. Spain ought to be a great honey country. It has the right kind of flora, and excellent climate, and proximity to great honey markets. In fact, there is a great opportunity right now for the Spaniards to show what they can do if they will only follow the lead of the Cubans and import American bee-supplies by the carload. Will they rise to the opportunity and grasp it? They can very speedily overtake and surpass all European or West Indian rivals.

#### CANE SUGAR VS. BEET.

Dr. Miller wants to know more about sugar. It is a difficult matter to explain this to the public, but I will try. Long ago Huber found out that raw sugar, when fed to bees that were engaged in comb-building, produced more beeswax than a high-grade or refined sugar. In fact, they made more from raw sugar than they did from honey. This experiment was verified by Dumas and Milne-Edwards, two very celebrated French naturalists who used the most careful tests in the work. Others have tried this with the same results. You can not very well try this experiment with beet sugar. Raw beet-root sugar is not very nice. In England, where beet sugar is very common, it has been often noted that bees do not do so well when fed on it. Remember, too, the beet sugar is a little cheaper and easier to get. The Germans get around it somewhat by inverting the beet sugar. The syrups they make are very nice indeed, and are sold all ready for the bees. They are sometimes made with grape sugar added. This is to make the syrup resemble honey as far as possible. In this case an ounce of practice is worth a pound of theory. Bees are very fond of and do well on the juice of sugar-cane. It encourages wax secretion. The best cane sugar for bees is the simple open-kettle brown sugar made in Porto Rico. The advent of Americans

into the islands has nearly put a stop to its manufacture. It is made in the same way maple sugar is, and of course retains the natural phosphates, salts, and phosphoric acid present in the cane-plant. The cane sugar, with large yellow crystals, is next best. Fruit-canners also prefer it because it has a sweet honey-like flavor.

It is not so easy to get such sugars, because the sugar trust people want to pocket about a cent a pound made in refining them into white sugars. Raw sugars pay a much lower duty than refined, and it is in manipulating this difference that the trust has made millions in profits with no equivalent benefit to the consumers. Some of these raw sugars would suit us better than the refined; but the trust wants them, and controls the situation. The trust does not care to handle imported *refined* sugar—that is, sugar above No. 16 Dutch standard, and very little is imported.

Our most highly refined sugars, even when made from cane, are objectionable, because they contain traces of very powerful poisonous chemicals used in preparing them. These are not necessary, but they are cheaper, and easier to use.

## BEE-KEEPING IN THE SOUTHWEST

BY LOUIS SCHOLL

Cotton honey, when gathered from that source alone, and from rank growing, thrifty plants, is nearly if not quite as white as white-clover honey. This year we have had an abundance of cotton honey, and several other bee-keepers who know will confirm the above. When first gathered, cotton honey has a rather strong flavor of the plant itself; but as it grows older this is lost.

"Waxcraft" is a good book on wax. Now, why not have one on *honey*? It is interesting to note the many different uses made of wax, especially for technical purposes, both in practical recipes and in medicines. It would, perhaps, be more surprising to note the extent to which honey is used in these things. I know honey is much used in medicine, etc. and it seems to me; a book of this kind would be welcomed.

A common long butcher-knife, well sharpened, and kept free from the gumming of honey, by frequently washing in *cold* water while uncapping, is the knife I have preferred for several years, after using several of all the different uncapping-knives on the market. Since the cutting is always downward, the stroke is more direct, as there is no bend in the handle. The knife reaches clear across my shallow combs, and it is much more easily wielded.

We're doing the fairs with our exhibits. It's a good advertising scheme, both for the exhibitor and the fairs. We've been very welcome there; and to encourage these exhibits, liberal premiums are provided. For these reasons good exhibits can be made, for otherwise it is expensive to get up creditable exhibits and go long distances to

fairs. We enjoy it, like Mr. Hutchinson; and if one is clever enough to have every thing arranged properly it is not so difficult a matter to make the moves. More should try it, and advertise our industry.

Not much has been said in print about "one of the signs of queenlessness," p. 1048, and I am in doubt whether there is very much in it. But, of course, localities differ. I've often studied over the matter right at one of these colonies, with the combs in front of me. I remember often remarking in the midst of such a quandary that "I would gladly give a dollar to know for certain whether or not there is a virgin queen in that hive." There were all kinds of signs pointing to one or the other. Sometimes the bees will keep the cells in the center of the brood-chamber so nicely polished for weeks that one will expect a laying queen to take possession at once; and, again, I have seen those cells filled with honey throughout the brood-chamber with a virgin in the hive several days, and, several times, even after the queen had begun laying in a few empty cells scattered right among those with honey.

### NARROW VS. WIDE TOP-BARS

The shallow frame that has given me the best satisfaction, and which has been tried in my yards for ten years, is just like the regular 5½ Hoffman self-spacing frame, with the exception of the top-bar. My top-bar is only ⅜ inch wide, but ½ inch thick. It is stronger than the wide thinner ones on the market, and thus gives more free communication between frames from super to super. These spaces are very narrow in the supers as now made, and act too much like queen or "bee" excluders. This is detrimental, especially if the frames are used in brood-chambers. No groove for foundation is needed, as the foundation is fastened with melted wax much more easily. When the frame is new, the groove is in the way or else the sheet must be carefully put into it; but when the frame is refilled again and again the groove is filled with wax any way. Why are they not made plain regularly, Mr. Editor?

### BULK COMB HONEY IS MORE PROFITABLE IN THE SOUTH THAN SECTION HONEY.

Of all the trouble I had this season it was the fixing-up for the production, then the taking off, the scraping, labeling, grading, casing, crating, and shipping of a few hundred pounds of *section* honey. It was the most expensive honey we produced, and it gave the least returns for the investment. The good old "chunk" honey, as many call it, beats it all to pieces here in the South. It is more easily produced, easier taken off, packed, and shipped, and more readily marketed at good remunerative prices.

We not only save the great expense of buying sections and shipping-cases every year, but the bees make *more* honey in our frames than in sections; and we save high freight charges and the danger from smash-ups here in this warm climate. Bulk comb honey in cans goes at fourth-class freight rates, the same as extracted honey, while section honey goes at double first. Then it is much easier to prepare and pack a crop of the bulk comb honey than of sections; and as there

is the greatest demand for the former, it means more dollars in our pockets to produce that kind.

#### SHALLOW VS. DEEP SUPERS.

Another year of extensive manipulations with both deep and shallow supers convinces me still more that more satisfactory results can be obtained by using shallow supers for extracted honey as well as for comb honey. They have more advantages than disadvantages. It is true that more supers and frames must be nailed up for a given quantity of honey secured, and the first cost is a little greater. It may be well to keep in mind, however, that, as lumber gets scarcer, narrow lumber may be less expensive for the shallow supers; and as the shallow frames are made with a much lighter top-bar the difference in the amount of material between two shallow frames and one deep one is not very great. What difference there is between this and the nailing-up of the frames is soon offset by the fact that no wiring is necessary with the shallow ones; and, further, that thin super foundation is used in them, thus making quite a saving at the very start in this respect. Such light foundation goes much further; and where the frames have to be refilled at frequent intervals the difference in expense soon counts up.

There is only one other argument generally brought out by the deep-frame advocates in favor of the deep kind, and that is the question of uncapping. Even if I should concede their claims I have found so many other points in favor of the shallow frames that it puts the others much in the shade. This is speaking of *my* manipulations in *my* localities, of course. But since these localities, of which there are a dozen, vary very much, I am sure the same differences would hold in apiaries still further away.

There is an advantage in giving the bees room by tiering up with shallow supers, and the gain here is again enough to pay for the extra trouble and expense, as just a little more surplus that is obtained in this way counts up in a whole crop.

The main gain comes in taking off the crop. What a slow job to have an empty box on a wheelbarrow into which each comb is put separately after brushing off the bees, irritating them and starting robbing in a wholesale manner! We have tried this. It was our way *before we knew better*. Now we have this to do only when a queenless colony has been set on top of a strong one and the deep combs have become filled with honey during the rush; and even those who have assisted me at various times have carefully left these to the very last to be taken off.

No brush is ever needed in our apiaries when removing honey. A good smoker and a hive-tool are all. The combs being shallow the bees can be sent scampering down as soon as the cover is raised. Half a dozen colonies are opened in quick succession, smoke driving down most of the bees, when the full supers are jerked off, set on end on the ground, when the rest of the bees hurry off. In half an hour a thousand pounds of honey is ready to haul in. The few bees that cluster on some of the supers are jounced off over the wheelbarrow handles.

So far I've beaten the deep-frame advocates; but now it comes to the uncapping. The knife

reaches over the entire width of the comb, and—you know the rest! If the deep combs were *always* as evenly filled as the shallow ones, fewer combs would need to be handled; but the lower part of the combs is too often more difficult to uncap, so the difference in uncapping is not so great after all. Besides, two of my  $5\frac{3}{8}$  combs hold more honey than one L.

## GENERAL CORRESPONDENCE

---

### SELLING HONEY.

**Some Experience in Selling Honey from House to House, and to Grocers; the Requisites of a Good Salesman.**

BY WESLEY FOSTER.

There have been a good many articles in the bee-journals on the subject of selling honey. These articles have treated the matter in two ways: 1, house-to-house selling; 2, introducing the product to the people through grocers. Calling from house to house brings one in closer touch with the consumer, and the sales will be greater in number for the territory covered; but in a large city such a plan would be impossible if it were desired to cover the entire territory. The ideal way would be to go from house to house with a sample of both comb and extracted honey, and let the people taste the extracted, and sell them as much as possible right there, informing them that they can get more of the same quality, at the same price, of their grocer, if they ask for it. Some of the best literature concerning honey should be left. I used this plan when I lived in a small place, and it succeeded.

For several years I have sold to the grocers only, except our near neighbors, who come to our house for their honey. The difficulty with selling through groceries is in getting the grocer to display the honey in a prominent place and push it forward on his rounds taking orders. This difficulty can be overcome if the honey-salesman brings the need for display, reading-cards, price cards, etc., to the attention of the grocer and furnishes him with the material for this. The seller of the honey can afford to put an observatory hive in along with the honey display if a good window is placed at the disposal of the salesman. A display of this kind can be left for a week or two, and then moved to some other store. If enough business is done to warrant the expense, several outfits in use at once are better.

Bee demonstrations and exhibits at fairs are popular because the details of bee-keeping are now understood less than those of any other industry.

I have sold honey more or less since I was twelve years of age. My first selling was done after my father had harvested a fair crop of comb and extracted honey from basswood and white clover. We were then living in Iowa. I carried four or five sections in a peach-basket, cali-

ing from house to house, showing my product (or, rather, the bees'). My brother was helping too, he taking one side of the street and I the other. When we got to the end of the street we would compare notes and hold a miniature salesman's convention. Father used few separators at the time, and many of the sections were very fat. My price was one cent an ounce, and each section was weighed and the weight marked on the wood. Often my cakes of honey weighed 20 ounces. If I sold two dollars' worth in an afternoon I was satisfied.

When I was fourteen my father moved his family to Colorado, and after that I used a wagon for my trips and went further from home. I sold honey, mostly extracted, in several coal-camps. I had a pair of scales in the wagon, and weighed out the honey in the customer's own package. Visits were made twice a month; and on one trip, in a town of about twenty-five houses, I sold honey at every house but one, and there was no one at home there. The people in this little town would eat from two to four hundred pounds of my honey every month; and one boarding-house used nearly a hundred pounds every thirty days. My price was ten cents per pound, and it cost me about seven, so my percentage of profit was good. I believe honey-selling may be made to compare favorably with the selling of goods in other lines, and salesmen as a rule are better paid than office workers.

One forenoon when out with some of my own honey I sold fifty dollars' worth—fully ten per cent above what I could have secured in any other way—and saved two or three per cent more on freight.

Any man who knows something about honey, bees, and the flowers that bees work on, can put up a convincing talk to a grocer. Convince him that you know how to take care of bees and how to raise honey, and usually his foolish fears of adulteration will vanish before your bee-and-honey talk. I get their confidence by answering as best I can all the questions they ask. Then I enlarge on the wisdom of handling the best honey, and also on the fact that my prices are so they can make a good profit on the article. Do not try to get grocers to handle any thing on less than 20 per cent. If you have a line of comb and extracted honey, try to let the profit on some run up to 30 per cent, and then the grocer will not hesitate to handle some for 20 per cent. Honey is not as yet a necessity, and luxuries usually bring the largest profits.

The best sale I have made so far was about a month ago. I called on The Blank Grocery Co. and told them I had new comb honey, and judged that they could use at least a case a week. Mr. Blank took me back and showed me a pile of seven or eight supers full of nice comb honey, but last year's product, and all candied. I frankly told him that he had that honey on hand late in the season, and that the best thing to do was to render it and have it put in bottles for his trade. In a short time I had sold him two cases of new honey, and took the old to render for him at a cash price to pay for my time. One week after finishing the rendering of his honey I sold him 100 cases of new honey—fully fifteen per cent above what I could have sold unless I consigned it, and it is a question whether I would

have obtained anywhere near the price I received.

In every town of any size one will find little stores where it is hard to sell honey, as they carry a very small stock. I find that these are good places to sell honey, though I often have to leave the honey and let the grocer sell it and pay afterward. Honey will sell in any place if displayed in a prominent place, and in all these consignment cases I require the dealer to make a special effort to sell, and give him 25 per cent, so it is a virtual guarantee of that much, or I take back the goods. I have never been asked to take back any honey yet. Sometimes I am able to do even more for the storekeeper, such as fixing up a window display of honey and beeswax, etc., for him. It is more to my interest that the grocer should succeed and make money by selling my honey than that he be overstocked. I try to get into the confidence of the grocer; and if I am his true friend he will often tell me his real trials, and I must understand his business well enough to offer some suggestion that will often help him out. It will at least show him that he has my genuine sympathy. Under such circumstances a selling-trip will be nothing but a round of pleasant calls. This is real salesmanship, which is easy after the first plowing is done.

Salesmanship is diplomacy, for a man must be persuaded to part with his money, which is a most painful procedure with most of us. The wire to pull is the mention of the profit he will receive in addition to his first cost.

Here is a sample talk. I never gave one just like this, perhaps, although the substance of it has passed over the counter several times before my honey followed suit:

"Good morning, Mr. George. My name is Foster. I live down on Arapahoe St., across from Lincoln School. I am a bee-keeper, and raise honey to sell to grocers like you. I never met you personally before, but have known you by sight for some months. May I tell you about the way I put up my honey, and the generous profit the grocers are making who handle it?"

Generally I am encouraged to go on. "Now, I have comb honey put up in cases of 24 sections, graded according to the rules." Then I tell him about the rules so he can judge comb honey himself. "My extracted honey is thrown from the combs by centrifugal force, the cappings being removed with a knife made for that purpose. The honey is then heated to 150 to 170, and bottled at about 110. Honey thus put up will not granulate so quickly as when put up cold. My honey, both comb and extracted, is gathered by the bees from alfalfa and also from sweet clover. You can make 20 to 30 per cent on this honey; and as all pure honey will granulate in time, I can replace any that candies, before being sold, with new fresh goods. I see you have a few jars on hand, in which the honey is candied. If I had sold you that honey you could call me up and have liquefied honey in its place. If you will take ten dollars' worth of me I'll liquefy what you have on hand, free of charge."

"But," says Mr. George, "I have few calls for honey, and do not care to handle the extracted any more. I can use a case of the comb if you will replace any that candies."

"You have brought out another point. Your

order boy doesn't ask people if they want any nice new honey, does he? Honey is a specialty, and needs to be pushed, and with the profit you make on it you can afford to push it somewhat. You put in several cases of the extracted in tumblers, half-pint jars, and pints; and if you can't sell it I'll take it off your hands."

In seven or eight times out of ten I get an order, large or small. On the second and third trip my sales are very much increased, and the grocers call me up and give me their orders by phone. When I start in with a grocer who is not interested I get him to talk about bees, bumble-bees, and their stinging abilities (this seems to be uppermost in the majority of people's minds), about the flowers bees work on, how queens are raised, and the organization and division of labor in a hive.

I have read most that Burroughs and Mæterlinck have written on the bee, and one can learn from them the popular way of telling about bees. It is invaluable in selling honey. When you have told a lot of bee experiences you will be known as a honey-man and not as a mere salesman.

The two objections most persistently brought up regarding extracted honey are, 1, that bee-keepers feed their bees sugar to get them to make honey, which process causes the honey to candy; 2, most of the honey on the market is mixed with glucose, sugar syrup, or just thinned with water, and neither you nor any one else can tell the genuine from the adulterated.

A restaurant manager fired both of these objections at me. He didn't think that I knew pure honey, and he thought the bees these days didn't get a chance to work on the flowers, for the bee-keeper kept stuffing them with sugar or molasses so they would make a great surplus of "fake honey." He thought we doped the bees with sugar, glucose, and molasses, and then further adulterated and thinned it after taking it from the bees to enhance our profit.

Some men are literally steeped in such ideas; and this man, before I left, mixed some honey half and half with water, and, after tasting it, said that would go with his customers as well as the genuine. He didn't know pure honey, and didn't believe but that his customers would not know the difference between half-and-half honey and the thick well-ripened article.

Fellows of this stamp are shoddy thinkers regarding others, and are not above shoddy practice to their patrons. The better plan to pursue with a customer of this kind is to push the comb honey and let him go elsewhere if he wants adulterated goods or wants to adulterate what he serves on the tables of his restaurant.

Denver, Col.

## HONEY RESOURCES OF NORTHERN MICHIGAN.

### A History of the Conditions Leading up to the Growth of the Wild Red Raspberry; What Constitutes a Raspberry Location?

BY E. D. TOWNSEND.

Northern Michigan is the home of the wild red raspberry, the honey from which is so fast forging its way to the front on account of its

beautiful aroma and exquisite flavor. This part of the State is also noted for its broken landscape, with the unlimited variety of soil, its hills, and its creeks and innumerable lakes. The timber also varies almost as much as the landscape. However, the bee-keeper is most interested in the honey-producing flora and in the location in general.

Probably more than half of Northern Michigan was once covered with the white and Norway pine, which has now been nearly all cut off for lumber. During the first dry season after the cutting, fire burns over this stump land, and then two or three years later the willow-herb comes to maturity. There was a time when this produced large quantities of very fine honey; but as the pine is now all cut, or nearly so, the prospect is that the willow-herb in Michigan has had its day. After the willow-herb this pine "cut-over" grows up to blackberry brush, and, later, white clover comes in. This white clover, when covered with snow, so that it does not winter-kill, usually produces a fair amount of very fine honey. The blackberry, on the other hand, never produces honey, for the bees rarely notice it. This district is now being settled and made into farms, and a considerable amount of buckwheat is being sown, which is a very good honey-yielder on the light sandy soil, although it is difficult to find a location where there is enough sown to support a large number of colonies. The little honey that does come from the buckwheat, however, is very welcome. On the lowlands near the creeks, rivers, and lakes, asters, goldenrod, and boneset come during seasons when the rainfall is abundant, and these produce some honey, although many times very sparingly.

There came a day, finally, when the pine timber was so nearly exhausted that the price of lumber soared high, and hard-wood timber became valuable. This was about ten or twelve years ago, and since that time the hard wood of Northern Michigan has been gradually cut off, and *this* cut-over is where the celebrated wild-red-raspberry honey is produced. Such land does not need to be burned over, and some think it is even better when it is not burned over, maintaining that the bushes are not thrifty when fire has run over the ground. It certainly looks reasonable that the bushes should be more thrifty, for the fire burns off much of the rich loam. To produce honey to the best advantage, the plants should be thrifty, for it seems that, if the growth is stunted, no honey is produced; or, in other words, if there is any thing the matter with the plant, the honey is the first to suffer. There is something to say on the other side of the question, however; for if the land is not burned over it will soon grow up to underbrush, which smothers the raspberry much sooner than if it is burned over occasionally. It is a disputed point, therefore, whether it is better to get a smaller crop for a longer number of years or to get a larger crop during fewer years. This hard-wood land burns over in April, before the leaves start to any extent; for when the leaves are grown the shade is so dense that the sun can not penetrate, and there is not much danger of fire running. When the fire goes over the *pine* cut-over it may run for miles, burning night and day, and it makes a very hot fire which burns the soil badly.

This is not the case on the *hard-wood* timberlands, for there it burns but slowly during the day, and at night nearly goes out, only a few old logs serving to hold the fire until the next morning, so that when the sun is up, and the dew disappears, it starts anew and burns another day. This is continued until there is a shower, when it will be put out; and since it burns so slowly, no very large territory can be covered before it is put out. This means that there is never a location wholly burned over, so most of the beekeepers have both kinds of pasture—the burned and the unburned.

We have said before that the wild-red-raspberry district is variable, and this must be taken into consideration when selecting a location for bees; for, on account of the pasture not being good in all places, it would be almost impossible to select a location where one could establish a series of outyards without going more than the regular distance. There are some such locations to be found, but they have been occupied for a long while; and now if one wishes to find an unoccupied location he will have to go back quite a distance, and even then he will quite likely find a location suitable for only one yard. He will then have to hunt some other place for the next yard. It should be stated, furthermore, that even these scattering locations are nearly all taken; for whenever there is a good thing there are always several ready to accept it. Take, for instance, the case of the Hutchinson Brothers. Although W. Z. Hutchinson has traveled extensively over the State, they were obliged to accept a location so situated that some of their outyards are eight miles apart. One is often compelled to buy out some one already established, in order to secure a location.

Another point to be considered is that the level or desirable land for farming purposes will soon be cleared and made into farms. This usually happens soon after the timber is cut, so that the raspberry does not have a chance to grow or produce honey. In view of this, one should locate where the land is so rough and poor that it can never be cultivated. The majority of the best raspberry districts are of this latter description, and they will be valuable for the raspberry honey until new timber grows and smothers the bushes.

Mr. S. D. Chapman, of Mancelona, Mich., finds that some of his best raspberry district is where the timber was cut twenty years ago. This particular location must have been burned over several times, for there is a twenty-year-old "chopping" near our Kalkaska County bee-yard which has never been burned over, and it is now covered with timber, some of it 40 ft. high.

Thus we find the raspberry district to be always changing; and when one particular location is not yielding as it should, on account of a failing supply of the nectar-bearing plants, the apiary must be moved to some more desirable point. Of course, this is quite likely to be the case in other locations besides the raspberry, for the honey-producing flora changes with the country, and during this "era of outyards" it should always be borne in mind that it is better to be put to the inconvenience of going some miles to an outyard than to harvest meager crops at home in the midst of a worn-out pasture.

The wild red raspberry begins to produce hon-

ey some time during the first half of June, depending upon the weather. An early spring with favorable weather causes a rapid growth of the foliage, and consequently an early bloom that may reach maturity as early as June 1. During the last few years, however, or, in fact, during the writer's experience in the raspberry district, cold backward springs so retarded the growth that the honey-flow did not start until nearly the middle of June.

Remus, Mich.

[The question naturally arises, can we introduce some plant into Northern Michigan which will supplement the red raspberry? Sweet clover at once suggests itself, but there may be others. Sweet clover would do no harm, and yet it would in time improve the soil. Some of the poor lands of Michigan have been improved by the growth of mammoth clover.—ED.]

## FERMENTATION OF UNRIPENED HONEY AND ITS CAUSES.

BY EDWIN G. BALDWIN.

*Mr. Root:*—On page 1055 Prof. Cook tells of the unusual fermentation of honey on the hives, owned by a bee-keeper of Southern California. Prof. Cook attributes the condition to a possible excess of moisture in the air, but admits that this is but a guess. In Central Florida we often have it so damp for weeks that all things in the house will mildew and mold if not aired in the sun very often; and yet I have never noticed any fermentation of honey on or off the hives there.

On page 12 of the United States Department of Agriculture, Bulletin 110, Department of Chemistry, Mr. G. A. Browne has this note on changes wrought in nectar by the bees in their working and storing of the crude product:

"Another modification produced in the nectar by the bees is the introduction of a minute quantity of formic acid. This acid is wanting in the pollen and nectar of flowers, and is supposed to be introduced into the honey by the bee just previous to capping the cell. The formic acid thus introduced by the bee is supposed to act as a preservative, and *prevent the honey from fermenting.*"

In the article already referred to by Prof. Cook, the bee-keeper in California says, "The bees die off very rapidly." May not this mortality be a cause and not a result? May not the fermenting be caused by a *lack* of the essential formic acid—a lack caused, perhaps, by a pathological condition in the bees themselves? At least, the coincidence is striking; and as the occurrence is a unique one, it seems to me that perhaps the last word on this phenomenon has not yet been uttered. I should like to hear further concerning this singular state of affairs in Calexico in particular, and of formic acid and fermentation in general.

Trevose, Pa.

[Without knowing any more than has been said in GLEANINGS, I decidedly agree with Mr. Baldwin. It seems to me the nectar fermented because, for some unknown reason, there were not enough bees on hand to take care of it. Something killed off the bees, and then the thin honey fermented. With plenty of bees on hand, nectar will not ferment.—W. K. M.]

THE LATE E. W. ALEXANDER.

"His life was beautiful, his work enduring, his death triumphant."

## IN MEMORIAM OF E. W. ALEXANDER.

BY REV. D. EVERETT LYON.

On Saturday, Sept. 19, there passed from earth to heaven, in the death of E. W. Alexander, of Delanson, N. Y., not only a prince of bee-keepers but also one of the purest and most sympathetic of men who ever lived. For many months this kind-hearted man was a great sufferer from an abdominal affliction; and when the end came it was to him a welcome release from his untold suffering. The end came not to our brother as a surprise, but was the culmination of his expectation, and the summons found him with his spiritual house in order, ready to receive his well-merited reward.

For a year or more he often expressed to his devoted wife the desire that the writer might officiate at his funeral, and preach the sermon; and when the telegram called me to Delanson for that purpose I felt that it was a sacred duty that could not be ignored.

Leaving home immediately at the close of my Sunday-evening preaching service on Sept. 20 I arrived in Delanson the following morning, and proceeded at once to the house of mourning. Our dear brother had but recently purchased a beautiful little home, and it seemed a strange providence that he at only 63 years of age should so soon be carried from it.

When the hour of the service arrived, a vast throng of people crowded in and about the home to pay a last tribute of respect to one esteemed, and an honor to the community in which he resided. Though a great sufferer in the last few months of his life, yet in death his face seemed singularly peaceful, with just a trace of that genial smile that made every one feel that he was their friend.

I felt it a great honor to be permitted to stand beside his coffin and speak of his many virtues, and refer to his beautiful Christian character. After the service his three sons—Frank, Fred, and Bert—and his devoted son-in-law, acted as pall-bearers, at their father's request, and tenderly carried his remains to the waiting hearse.

A ride of four miles brought us to the beautiful cemetery at Esperance, where his poor tired body was laid at rest to await the resurrection of the just; and as I turned from the grave I felt that the bee-keepers had sustained a great loss in the death of such a friend.

May I be permitted to say a few words of appreciation concerning one who, as a bee-keeper, was a prince among us—the greatest Roman of us all—a very Gamaliel at whose feet we learned so much? Let me speak of him, first, *as a man*.

E. W. Alexander was every inch of him a man. Every thing that was mean and base he spurned with contempt, while every thing high and noble found in him its earnest advocate.

Like Longfellow's blacksmith, he could "look the whole world in the face," so pure and upright was his character.

Singularly sympathetic, he had a kind word for every one, and special sympathy for the man who was down and out.

All the years of valuable experience as a bee-keeper, much of it the result of costly experiment,

he freely gave to his fellow bee-keepers, and nothing delighted him better than to see the success of others.

As a bee-keeper remarked to me after the service, "He was the great reference-book for us all." Yet withal he was the most modest of men, and, though deeply touched by Dr. Miller's recent note, that he, as one of the rank and file, saluted him in his triumphant march to receive his crown of rejoicing, he said to his wife, "That was very kind of Dr. Miller, but, really, I don't deserve it."

Second, *as a bee-keeper*. Our friend was a truly great bee-keeper, not so much from the fact that he managed with his dear son Frank the largest apiary in the world in one yard, as that his management was so thorough and systematic, as based upon such a complete knowledge of the habits of the bee.

If for no other reason, his method of treating weak colonies in the spring, and other helpful suggestions, have placed the bee-keeping fraternity under lasting obligation to revere his memory.

As a frequent visitor to his apiary I can positively assert that all the wonderful achievements ascribed to him were literally true, as he was successful in every sense of the word.

It often pained him that others questioned the merit of some of his methods, notably that of strengthening a weak colony by placing it over a strong one, but he would frequently point out where failure was the result of bee-keepers overlooking some little though essential detail.

Every plan he suggested was the result of successful experiment, and he was actuated solely by a sincere desire to see his fellow bee-keepers succeed; in fact, the success of others was a passion with him.

What he has done for the bee-keeping world entitles him to a place with Langstroth, Dadant, Dzierzon, and other stars of the first magnitude.

Third, *as a husband and father*.

It has been my privilege as a clergyman to enter many homes in various parts of the country, and yet I must say that, for happiness, harmony, and contentment, the home of our brother was an ideal one. He loved his home, his wife, and his children. On the occasion of a visit he related to me with much pardonable pride the satisfaction he felt in the fact that his children were all doing well, and that none of them had ever caused them a headache. What a comfort this must be to his sons—noble, manly fellows, every one of them—and to his devoted wife and daughter! It is such sweet homes as this that constitute the bulwark of our national righteousness.

In closing I desire to speak of our brother, fourth, *as a Christian*.

Brother Alexander was not only a Christian by profession, but, best of all, he lived the Christ life, and followed the example of his Savior, who "went about doing good."

Our friend made no loud profession; but everybody knew that he loved God with all his heart and his neighbor as himself, and Christ said this was the sum total of religion.

A few days before his death, his dear wife, one of the biggest-hearted and most motherly of women, played on the organ, and sang, at his request, his two favorite hymns, "Jesus, Lover of My Soul," and "Nearer, My God, to Thee;"

and when she finished he requested that she sing them over again, which she did, to his great satisfaction.

The day before his death he turned to his wife and said, "Oh! wouldn't it be nice if, when the end comes, I could just go to sleep?"

Truly, with Paul he could say, "I am now ready to be offered, and the time of my departure is at hand. I have fought a good fight, I have finished my course, I have kept the faith; henceforth there is laid up for me a crown of righteousness which the Lord will give me at that day; and not unto me only, but unto all them also who love his appearing."

Among those present was Mr. N. D. West, of Middleburg, N. Y., who, in the past few months, has been a frequent visitor to the Alexander home, and who, like the writer, felt most deeply the loss of a true friend.

"E. W. Alexander, hail and farewell." "We will meet thee again in the dawn of the resurrection morning."

The bereaved family have the sympathetic prayers of the bee-keeping brotherhood.

Whatever provision our dear friend has made for his family is as nothing compared with the priceless legacy he has left them of an honored life. If I were to choose the epitaph to be placed upon the stone to mark his last resting-place, it would be this:

"His life was beautiful,  
His work enduring,  
His death triumphant."

Rye, N. Y.

FIG. 1.—LOAD OF BEES ENTERING THE WATER TO LOAD THE BOAT BOUND FOR LONG POINT.

### MIGRATORY BEE-KEEPING.

Moving an Apiary to Basswood at Long Point Island, Ontario, Canada.

BY PAUL MICKWITZ.

It takes experience and care to move bees on the train; but something else is necessary for moving them 12 miles over water in small vessels. It takes courage. Mr. R. F. Holtermann, of Brantford, Ont., with whom I have been this season, has twice before moved his bees to Long Point. This beautiful island, situated in the northern part of Lake Erie, belongs to the Long Point Co., which consists of millionaires from New York, Buffalo, etc. It is especially noted for its excellent opportunities for hunting and fishing. About three-fourths of the trees are basswood, which sometimes yield heavy crops of honey. Twenty years ago Mr. Holtermann had his bees on this island for queen-rearing purposes.

Two years ago he had 240 colonies there for the basswood-honey flow, and since that time he has had the sole privilege of utilizing its rich honey resources. This time 100 twelve-frame L. hives were moved over as announced on p. 932, Aug. 1st.

The preparations were made so early that we could take a rest before the night work began; but after sunset the screens were put on. The large space be-

FIG. 2.—LOADING THE BOAT FROM THE WAGON.

FIG. 3.—UNDER WAY.

tween the entrance and the screen, made possible by the portico, seems to be a splendid arrangement, for the bees have a chance to get out of the hive and get fresh air through the large screen. On four hay-racks the bees were taken to the station, where they were loaded in a cattle-car. Close attention was paid to the condition of every hive, and where bees in large numbers were playing with their antennæ through the screen, water was poured against it, cooling them.

The next morning we left for Lake Erie; but our freight train was so slow that we could not get the first lot of bees moved over to Long Point until about two o'clock in the morning, then, after placing the hives in the high grass on the shore, the water became so rough that it was impossible to take the rest of the hives over. Our boatman brought us back to the shore, but did not dare risk loading up again. He could not wait for us, either, and we were, therefore, compelled to seek another vessel. A little steamboat was finally hired, and the following morning the other lot of bees was taken 12 miles to the island. These bees had been confined 68 hours, and were still in an excellent condition, although they had been thoroughly

watered every hour, at least during the day, when the hot sun was shining on the shore. Two hives, in which the bees were suffering, we gave a flight in the evening. It seems to be very important, not only to throw water against the screens, but to throw it all over the hives.

The hives were brought from the shore to the steamboat on hay-racks, on account of the shallow water; and from the steamboat to the shore of Long Point they were brought in a little row boat, about 15 at a time.

Two weeks later the honey was extracted, and the bees brought back to the shore and placed ready for buckwheat.

Brantford, Ont.

[Mr. Mickwitz is from Helsingfors, Finland, Russia, and by arrangement before leaving there he is spending a season in Canada with Mr. R. F. Holtermann. It is his intention to spend another year in the United States, and then return to his native land to engage in bee-keeping. Before going to Mr. Holtermann's, Mr. Mickwitz spent one winter with The A. I. Root Co., familiarizing himself with the various styles of bee-keepers' supplies and other details of manufacture. He was not unfamiliar with the general subject of bee-keeping when he came to this country; but when he arrived here he knew practically no English; but in the short time that he has been here he has acquired a remarkable command of our language. His letter, which we publish, is a model of idiomatic English—not a misspelled word nor an ungrammatical expression.]

It is with peculiar pride that we observe that the bright and progressive young bee-keepers of Europe have come and are coming to America to study modern American bee culture. It is these young bloods who, in the near future, will be largely instrumental in setting aside the old straw skep and the box hive, and introducing the modern movable frame of the Langstroth type. There are movable frames of the Dzierzon style in Europe; but they have nothing of the conven-

FIG. 5.—THE APIARY AFTER IT WAS MOVED TO LONG POINT ISLAND.

ience and the rapid handling of the Langstroth in its various modified forms.

We wish to say of Mr. Mickwitz that he won the esteem and respect of his fellow-workers during his brief sojourn at The A. I. Root Co.'s plant. He will go back to his fatherland well equipped, and we doubt not he will be an important factor in modernizing methods among his own people.—Ed.]

### QUEEN KILLED BY A RIVAL QUEEN.

BY J. L. DAVIS.

In GLEANINGS for Aug. 15, third item of Stray Straws, you speak of the bees and not the queen as killing the other queen. Some years ago I opened a hive that had a young queen that was laying some three weeks. Her mother was in the hive laying also, as they happened to be on the same card. As I ran my eyes over the surface of the card next to me the old queen came through a hole next to the frame in the upper corner. She took a zigzag course down across the comb, stopped near the lower corner, and seemed scared. She was breathing fast. I watched her about five seconds, and pop came the young queen through the same hole in the upper corner. She came racing down across the comb. Just as nearly as I could tell, she followed in the same track that the old queen did. She came until she got within about an inch of her mother, and stopped for an instant. The old queen appeared to know that the daughter was after her, and was near. She started to go as if to do so carefully, and not be discovered by the other; but as she started I could

not tell whether the young queen jumped or ran, as she was so quick about it. However, I noticed that the three or four bees that were between her and the old queen did not get out of her way. She went right over them and grabbed her mother, as I thought, by the middle leg on one side close to her body; then a desperate struggle began on the part of the young queen to swing around to sting her mother in the mouth. The old queen did not fight, but tried with all her power to keep the young queen from getting her sting in her mouth. In about ten seconds she succeeded. In an instant she let go and started off as unconcerned as though nothing had happened. The old queen seemed paralyzed, and started to roll off the comb, her jaws working and legs twitching, and she was soon dead.

The next year I saw the same thing in Mr. Barnes' apiary, only the queens met while I was holding the card. Both of the young queens acted as though they had been drilled by the same master hand to do the killing.

I have owned bees for 54 years. Bees emigrated through and from here and the next county west about 40 years ago.

Dimondale, Mich.

[As a general rule we may say that where there are two queens in a hive the death of one of them is caused, not by the bees, but by the rival. But there are clearly some cases where the bees take a hand in it. This was clearly shown in the instance related in the Straw in our issue for Aug. 15 to which you refer.

Again, it may be stated that, if a strange queen be dropped into a colony where there is already a queen, the bees will immediately attack her—

that is, ball her and sting her to death, or kill her by suffocation. But if two queens be caged in a hive, say for 48 hours, and the bees are friendly to one they will be friendly to the other. Either queen may be released. Yes, both queens

may be released; and so long as they are kept apart there will be no interference on the part of the bees, probably, for some days. If the two queens are released during the honey-flow, if they can be kept from coming together the bees will not kill either one; but should they be able to meet, a mortal combat will take place. After the honey-flow is over, if the queens themselves do not settle the question, the bees will probably make way with one queen.—Ed.]

### RIVER-BOTTOM APIARIES IN TEXAS.

#### A Quick Way of Making Increase at Out-apiaries; the Danger of Floods.

BY LOUIS SCHOLL.

It is well known that the writer keeps bees in a great variety of places. The result is that he

is sure to get some honey somewhere. There are sixteen yards in all. The two pictured here are furthest away. No. 1 is 183 miles, and No. 2 is 197 miles from home. These can well be called "legged apiaries," as the hives are kept on high scaffolds on account of the overflows. This spring the water came up several times to within four inches of the bottom-boards, being  $3\frac{1}{2}$  ft. deep in the yard, and remaining once for nearly an entire week. These are the highest places for miles around. The water is from 4 to 6 ft. deep over great areas at such times. No. 1 is located in a young pecan-tree grove. These trees make an ideal shade during the summer, and they shed their leaves for winter so the sun can strike the hives. This is very necessary, as the atmosphere in these wide valley lands is very damp. Besides being one of the best shade-trees for all kinds of purposes, it is a valuable tree for nuts. If the trees have been "worked" (budded or grafted with the thin "paper-shell" variety), the nuts command an extra good price, and there is a good demand for them. These trees ought to be planted in place of the many thousands of other less valuable shade-trees. Bees gather much pollen from them in spring.

Fig. 2 shows another yard

FIG. 1.—SHOWING A "FLOOD APIARY" IN A PECAN-TREE GROVE; A VALUABLE AND IDEAL TREE FOR SHADE.

FIG. 2.—SHOWING FLOOD SCAFFOLDS, AND EXTRA BODIES FOR INCREASE LATER.

further down the river, near an area of basswood. Many bee-keepers of the North suppose we have none of this; but East Texas abounds with basswood in some parts. Cotton is the main source, as there are thousands of acres in the large plantations.

In the last-named yard, a lot of large hive-bodies with full sheets of foundation in the frames have been placed over the brood-chambers with the shallow supers of honey above. These are to entice the bees and queen away from the lower body, and a new brood-nest will then soon be started. After this is well along, about a 50-per-cent increase can be made in a very little time. A queen-excluder is slipped between the two chambers and left for a few days, *a la* Alexander, so no eggs or larvæ may perish, when the upper portion of the hive is set on a new bottom-board on the old stand, and the lower one, with a new cover, is moved to a new stand. The entrance of this old hive on the new stand is closed with grass, moss, or green weeds, to hold the bees a few days, when they will remove it. A queen or ripe cell is introduced before the cover is put on. This has been the quickest and easiest way of rapidly increasing bees at long range, and requires very little attention. When so many apiaries are greatly scattered it is necessary to resort to wholesale short-cut methods. I have made new colonies in this way, both in the fall after the honey-flow or in the spring before it. Often I do not return for several months after making the move.

New Braunfels, Texas.

## THE VALUE OF A SWARM-CATCHING CAGE IN A HONEY-YARD.

BY E. R. ROOT.

As it is getting toward the season of the year when bee-keepers will seek to make certain appliances for next season's use, I take pleasure in showing a useful device which almost any one can make. It is neither more nor less than a wire-cloth cage of sufficient size to slip over the largest hive in the yard. Wire cloth or mosquito netting is nailed on to a light framework of the construction shown.

It sometimes happens that a colony is suddenly attacked by robbers. A cage like this can be set down over the hive, trap all the robbers, and prevent any more from getting in at the entrance. The inmates of the hive will, if outside, cluster around the outside of the cage. It may be left over the colony until night, when the robbers may be destroyed or taken to an outyard; for to let these bees loose back into the same yard will only invite trouble for the next day.

But we have used the cage to very good advantage in catching swarms just coming out. One or two of them are kept handy in the yard; and if a swarm is seen coming out, one of these cages is clapped immediately over the hive from which it is coming. Even if some of the bees have gone out they will soon come back and cluster around outside while the rest of their companions are clustered inside.

In the photo here shown it will be observed that

A USEFUL APPLIANCE FOR AN UP-TO-DATE BEE-YARD.

EXHIBIT MADE BY SOME OF THE MEMBERS OF THE LEBANON, PA., BEE-KEEPERS' ASSOCIATION.

the swarm is clustered on top of the cage. As soon as they are all out, the cage and all is picked up at the intersection of the cross-pieces at the top, set over the hive ready to receive them, when the cage is given a jounce on the ground. A little later on it is given another bump until the bees have entered their new home.

Of course, this method of catching a swarm just as it is coming out is not new; but sometimes old things need to be resurrected until prospective users begin to see their value. This cage is one of the new old devices that should be made up for next season's use.

It may not be necessary to have such a cage where comb and extracted honey are produced; but if one is rearing queens he must not harbor in the yard any bees that have acquired the robbing habit, as they will be a continual annoyance to the apiarist and to the working colonies throughout the entire season.

### HONEY EXHIBIT OF THE LEBANON BEE-KEEPERS' ASSOCIATION.

BY E. L. BROWN.

The exhibit shown in the engraving is the first attempt of several members of the Lebanon Bee-keepers' Association, and consists of comb and extracted clover honey, beeswax, and leather-colored and golden Italian bees. The exhibit took the first prize on comb honey, first on extracted, and first on wax. We secured, also, a special prize of five dollars for the best and largest display of honey, bees, and wax.

Lebanon, Pa., Sept. 3.

[The honey exhibit, for a first attempt, is excellent. It shows good variety and the different forms in which honey is put up.—Ed.]

### THE SPIDER-PLANT AS A HONEY-YIELDER IN ILLINOIS.

BY A. N. COOKE.

I have experimented with the Rocky Mountain bee-plant the last season, and I find it one of the best for honey, as it yields more than any other plant that grows. I watched the bees gather the nectar from several flowers, and it took three bees in all cases to gather the nectar from one blossom. The first two bees stayed one and one-half minutes each; then the third bee stayed forty-eight seconds before it left the plant. I took a glass medicine-dropper with a rubber bulb to it, and I drew the nectar from 13 flowers, getting a teaspoonful in all. In one season there are several hundred blossoms to each plant, and the blossom-stalk grows about four feet after it begins to blossom, until it is finally about nine feet tall. There is no more beautiful sight than an acre of these plants in full bloom. I shall plant about two acres this year. I also have the white variety; but as to its value as a honey-yielder I can't say, as I got the seed only last fall.

If any one has a weedy patch of ground that he wants cleared up, he should sow the Rocky Mountain bee-plant. The weeds will leave, and the ground will get mellow in a short time.

Woodhull, Ill.

[It is our opinion that the plant you describe is not the Rocky Mountain bee-plant (*Cleome in*

*tigrifolia*), but the spider plant (*Cleome pungens*). We have seen the Rocky Mountain bee-plant in the Rockies; and while it very closely resembles the spider plant, being a very near relative, yet it is distinctly different. Moreover, we question whether a plant adapted to altitudes 10,000 to 12,000 feet above sea-level, and on a rocky soil, would be adapted to grow on rich prairie land such as may be found in Illinois of comparatively mild climate. Your description of how the bees gathered the honey, and of the size of the plant, tallies very closely with the spider plant.

In 1878 Mr. A. I. Root was very enthusiastic over this plant. He had quite a flower-garden of it, and at one time had as much as half an acre. It yields profusely, even late in fall, but it must have rich soil. When conditions are good it is one of the most remarkable honey-plants in the world. A single bee can not gather all the nectar there is in one blossom. Indeed, it is secreted so rapidly that a human being can gather it with a teaspoon. A. I. Root actually did this, gathering a sufficient quantity so that he was able to judge of the flavor of the nectar.

The spider plant is indeed a very ornamental plant, and is sold to decorate our flower-gardens sometimes.—Ed.]

---

### WHEN BEE-KEEPING PAYS.

#### No Encouragement for the Bee-keeper who does Not Look Ahead.

BY G. W. HAINES.

The man who is afraid of the bees, and never gives them any thought or care, but puts his whole time at something else, is not making bee-keeping pay. Some whom I visit allow the grass to grow up all around the hives. They have no sections or extracting-supers on, although in most places they talk about ordering some, and want to know where to get them quickly. Their bees are swarming, and no hives are ready. If I ask them if they take some bee-journal they usually say they get a sample copy once or twice a year, but they can not afford to take it. When I tell them that one colony of bees, if properly taken care of, will pay for a bee-journal and a book on bee-keeping the first year, many times, they say if they were a supply-dealer, or an editor of a bee-journal, or a State bee-inspector, they could do big things too; but the bees alone do not pay.

In looking over their hives it makes me want to talk to them on hive-making; but there is no use so long as they are sure that the business does not pay.

On the other hand, I sometimes call on a bee-keeper and find him at work with the bees, getting every thing ready ahead of time. He will have a lot of hives piled up nice and straight to keep them from warping all out of shape, and enough supers and sections on hand for the harvest. Besides the extracting-combs well taken care of, he will have a good supply of new frames nailed and ready for use, as well as plenty of foundation. Every thing about the bee-house will be in order, and on a shelf I will find three or four of the best bee-journals and half a dozen up-to-date books on bee-keeping. As we sit and talk about the bees and different honey crops of years

gone by I do not have to ask him whether bee-keeping pays.

Mr. E. W. Alexander often told us wonderful stories at the conventions, so one morning I boarded the train for Delanson, N. Y. I found him in the honey-house, and we walked out through the apiary of those 750 nicely painted hives, all set in straight rows, while clouds of bees were bringing in the nectar from up and down that beautiful valley. He showed me that large honey-house and bee-cellar, and his way of extracting and managing bees. When we went into the honey-room I stood and looked at the thirty tons of honey, all from one yard.

The more honey a man has, the more he looks to the marketing of his crop, because a cent or two more per pound amounts to something. A man with only a few colonies, on the other hand, thinks it does not make much difference with him, just so he cuts the price and closes it out *because the business does not pay*.

I have heard people say that, when the bees are ready for winter, there is nothing more to do! However, the fall is just the time to commence for a big crop of honey, and it takes all winter to get the hives and every thing else ready, and all the evenings to read the bee papers and books.

Some one may want to know what journals to take. Take them all; and as for books, commence with Quinby, Langstroth, and all the rest down to the present date, as the bees pay for them if the owner does his part.

It was a pleasure for me to take the first premium at the county fair for the best exhibit of bee-keeping books and journals.

When one can stand the stings, lots of hard work, and occasionally a poor year, and if he is a good salesman at wholesale or retail, then there is money in bees.

Mayfield, N. Y.

### RETAINING THE AROMA OF NEW, WELL-RIPENED HONEY.

BY G. A. LUNDE.

I have noticed in GLEANINGS, off and on, that you lay great stress on having extracted honey well ripened before extracting. I have been interested in this question for over 20 years, and read with interest what Mr. Burnett, of Chicago, and others have written on the subject; but I have failed yet to find any positive information as to the *modus operandi* of how a person can, after extracting, retain this aroma or the fine flavor well-ripened honey has just when extracted. I doubt if any bee-master can give any solution to the problem. I have no bees here. My son is running our yards at Wausau, Wis., but I may also keep bees here next year, if I stay. We have of late years been in the practice of putting up our honey in Aikin paraffined paper bags. But I am inclined to think it is more difficult to arrest the flavor this way than when put up in tin cans or glass jars. When extracting we do it this way:

We put the honey in open barrels, as fast as extracted, with a cheese-cloth cover over the top of the barrel when not working. Then when honey, say in September, commences to stiffen, we fill the paper bags from the faucet.

We put these bags into an empty hive, as many as we can conveniently get in. This prevents them from tipping over. Then we carry these hives upstairs, open the windows so the honey will harden the sooner, and, when fully solid, we seal the bags.

Now, of course, the bags will have to be left open before being sealed; then my question is: Will not the flavor be lost during this time before the bags are sealed? We put the cover on the hives; but I should judge the flavor would escape any way.

I like the method of putting up extracted honey in these bags. Honey is handy to handle, to ship, and to serve in this way. But if the flavor can not be retained, I for one will have to try some other method. I should be glad to know if there is there is any method by which the excellent flavor of well-ripened honey can be kept in the honey when put up in paraffined paper bags. Who can give the information?

Hayfield, Minn.

[We referred this to Mr. W. A. Selser, of Philadelphia, who replies:]

The exceedingly delicate aroma of honey in general is at its best when evaporated by the bees very rapidly during the honey-flow. Nectar gathered slowly, and placed in the same cells on different days, will not have the intensity of aroma that nectar has when placed in an individual cell, all within a few hours. This can be detected by a careful observer testing the honey in the middle of a frame and on other parts of the same frame that has not been placed there by the bees on the same day.

I have made a series of special experiments in this line by washing the honey in a glass-stoppered, closed, filtered funnel with ether. After drawing off the residue (of ether and honey) I have been able to retain the aroma for a long while. This is one of the experiments which will enable one to distinguish which plant the bees have gathered the nectar from. Quite often the taste is deficient, and the aroma in honey more distinct, or, sometimes, *vice versa*. This would indicate that the rapid evaporation of the ether in contact with the honey extracts the aroma, and it has made clear to the writer that, under perfect atmospheric conditions (entire absence of humidity), the same action takes place, only in a less marked and rapid degree.

The aroma of honey has often been spoiled on account of the cappings of the cell not being airtight, or the honey left on the hive too long, and the foreign smell of the bees is absorbed by the honey if left on after it is capped. Therefore the only way to retain the aroma is to exclude it from the air as soon as it is capped. There is no way, therefore, to retain the aroma of honey when put up in bags such as Mr. Lunde is using. The best honey, after it is candied, naturally does not come in contact with the atmosphere except on the surface. Therefore if the honey could be allowed to candy in air-tight barrels or vessels, and then dug out in its hardened condition and placed in paper bags, the desired results could be obtained, but this, no doubt, is hardly practicable.

Honey can be extracted, put up at once in air-tight barrels, coated with paraffine, and shipped a considerable distance, then immediately bottled,

without any appreciable loss of the aroma. This is why honey left to ripen in large tanks, from the very nature of the case, can not be as finely flavored as honey capped rapidly by the bees.

W. A. SELSER.

## PROPERLY PROPORTIONED SYRUP FOR STIMULATIVE FEEDING.

BY SWARTHMORE.

Properly proportioned feed and its mixing is quite important; in fact, it is a matter for serious consideration. To secure the best possible results at the lowest expense the following recipe is recommended:

Place in a twelve-quart milk-can, for instance, several pounds of best granulated sugar, and mark to what point in the can the sugar comes. Then pour upon the dry sugar boiling water, stirring all the while until the syrup rises to the point marked. Stir until thoroughly dissolved; then cork the can and set it aside to cool.

A CONVENIENT FEEDING-CAN TO HOLD SUGAR SYRUP FOR STIMULATIVE PURPOSES.

When feeding-time arrives draw off this sugar syrup, a jar half full; add a little honey to flavor; then fill the remaining space in jar with clear water, using cold water if the weather is warm, and hot water if the weather is cold.

This we have found to be the safest, quickest, and best plan for the mixing and keeping of feed for stimulative purposes in a queen-rearing yard.

If the can is provided with a gate for ready drawing, so much the better.

If much feeding is to be done at one time, mix the syrup in a larger vessel and pour from that

into the jars. A large-sized tea or coffee pot is first rate for this purpose.

All vessels for feeding should be provided with covers lest troublesome robbers make life miserable to the apiarist.

Swarthmore, Pa.

## PAPER WINTER CASES.

### How they Wintered the Bees, and how they Increased the Honey Crop.

BY L. C. ALWIN.

The drawing herewith illustrates my method of packing colonies in the spring. The first hive shown is one used in the Ferris two-queen system; but the method applies to eight or ten frame single-queen colonies as well, as shown in the second drawing.

On account of the late cold and disagreeable springs, packing has become a necessity in these northern States, and the above plan, it seems to me, has proven the most practical of any that I have employed.

The reason I use two pieces of tarred paper is because I am not able to get paper large enough to cover a 14-frame hive from cover to bottom-board, as it ought to if good results are secured. I do not know whether there is any advantage in having two pieces, except that there would be a double layer of tarred paper in front, in the rear,

and on top; but this can hardly be considered on account of the expense of using two pieces for a hive. There is no doubt that one piece of tarred paper per hive would be better. I use only two pieces for the Ferris hives. My eight-frame hives are all packed with a single piece.

In putting on this packing I have not made it a practice to tie it down with string, but use broad-headed tacks that I can easily drive into the wood with my thumb. But I have tied the packing of some of the hives, and think it just as good as tacks, if not better.

I am not an advocate of wintering bees outdoors in a climate so cold as that of Minnesota, although I have wintered, and am at the present

time wintering, bees outdoors successfully. My success is due to a great extent to the mild winters we have been having the last few years. But the system of packing that I describe is meant for spring protection; but I do not hesitate to advocate this method of packing for winter in a climate like that of Ohio. Although our winters have been mild, our springs have simply been — well, I can't think of a word strong enough to express myself properly—but the average temperature from the 1st of April to the 15th of May was 40° F. last year; and in spite of these conditions I had my colonies boiling over with bees, and swarming by the last week of May and first of June; and if bees rear brood extensively so that, by the last of May, the hives are just boiling over with bees and brood, with the temperature outside ranging below freezing, you can certainly winter them outdoors successfully in a climate where the temperature rarely goes below zero.

Last spring, March 15, on account of the mild weather and the restlessness of the bees, I set 54 good colonies on their summer stands. Of these, I packed 41 according to my method; and because I ran out of newspapers the remaining 13 were packed with tarred paper only. This warm weather was soon followed by a cool spell which lasted until the last days of April. On the first of May we were blessed(?) with a foot and a half of snow. This was soon followed by severe cold weather, with the temperature ranging from 5 to

10° above zero. This lasted for over a week. During this time I made it a practice to give each colony a pint of hot sugar syrup each day. The 41 well-packed colonies took theirs every day, and would have taken more. The 13 with only tarred paper would not take the syrup during this cold spell; and every night I changed hot syrup for cold, only to find it, next night, cold and untouched. Following this cold spell came a period of warm weather, and I took the occasion to examine the bees and see how they withstood the cold weather. The 41 newspaper-packed colonies had, in the eight-frame colonies, eight frames of brood or six frames of solid brood, and were boiling over with bees; and of the Ferris, or twelve-frame colonies, there were 12 frames of brood or 10 frames of solid brood, and they were hanging out at the time of examination with the temperature at 78° in the shade. Of the 13 colonies packed only with tarred paper, eight were dead—starved. Two absconded, and went into other hives, and three were sticking out their stings and shaking their wings at me when I took off their cover; and by feeding and coaxing I was able to build them up to be fairly good colonies for wintering by fall.

It might be of interest for me to say that the 41 colonies that were rearing brood during this cold spell averaged 100 lbs. per colony in last year's poor season.

New Ulm, Minn.

[The use of two pieces of tarred paper in place of one will facilitate very materially the packing and unpacking; but we would suppose that, at the line where the top piece overlaps the bottom one, wind and water would beat in; and if the hive is tipped a little sidewise the water would run down between the packing. Perhaps you overcame this in some way.

It is a little surprise to us that you secured as good results after feeding in such cold weather, even though the syrup was given them hot. It would have been our opinion that this hot syrup would have so stirred up the colony that bad results would have followed. At all events, we would say that beginners should be cautioned; for unless hives are well packed, and colonies very strong, such feeding would be a very doubtful proceeding.

In a general way we observe that, where your hives were packed with newspapers under tarred paper, you not only secured excellent results in winter, but increased materially the amount of honey. We see no reason why hives well papered under caps should not winter their colonies just as well as those having a wooden cap over them. It was demonstrated last winter in our own yard, and reports went to prove it, that a mere paper cap without packing under it is hardly sufficient protection for outdoor-wintered colonies in localities where the temperature goes down to 10 or 20 above zero, occasionally hovering around the zero point. There should be several folds of newspaper, old carpeting, blankets, or something under the cap to provide the necessary insulation, for a cold atmosphere will penetrate a 7/8-inch board. If, however, such boards be covered with several folds of newspaper, with a good protecting cap, either of paper or wood, good results will ordinarily follow.—Ed.]

## HEADS OF GRAIN

### FROM DIFFERENT FIELDS

DEEP SPACE UNDER BROOD-FRAMES; QUEEN-MATING EARLY IN SPRING.

In experimenting on how much space should be allowed under brood-frames I have used this season the regular A or Danzenbaker bottom and B style bottoms, 1½, 3, and 4 inches deep. The Danzenbaker bottom gives traces of wax; the 1½-inch B bottom gave one inch of comb built below the bottom-bars; 3 and 4 inches gave clean bottom bars. I think these experiments tend to prove it advisable to use a frame about 3 inches deep between the brood-chamber and the bottom-board. While this is true of summer I have no doubt it is also true of winter, giving more ventilation and protection from frost, especially if arranged so bees and air must pass from front to rear of hive before entering the brood-nest. Now to prevent the increase in bee appliances I intend

to place escape-boards, with the escapes removed, between the three-inch frame and bottom-board, giving the bees a central entrance and 3 inches of space under the brood-combs, with a vestibule of the bottom-board. See illustration.

Bladen, Ohio.

CHAS. H. CARGO.

[If the experience of Mr. C. P. Palmer, as related in our Sept. 15th issue, p. 1136, is any criterion, it would seem as if your form of bottom-board might not be very satisfactory for winter use. We can hardly see what gain would be accomplished for summer. Indeed, in a space so deep the bees would be inclined some seasons to store comb if they did not last season. Better not make too many of them.—Ed.]

#### BEE-KEEPING IN ALASKA; PREVENTING HONEY FROM CANDYING IN THAT COLD CLIMATE.

I find that setting a can of honey for a number of hours in hot water prevents it from candying, the length of time depending, of course, on the heat of the water; and as the general public does not know enough to follow instructions concerning heating, it stands me in hand to do the heating before I sell.

Now, suppose I can rent a heated room from the heating-plant—will that be as good? and how long should I keep it in a room of a given heat? Would 120 degrees for 24 hours be too much or better than 120 hours at 140 or 6 hours at 160? Any heating I have done so far has, if any thing, improved the honey; but I am wary of making an experiment on a big scale where there is so much at stake. I have had honey here two winters without candying, and during one of the winters we had the mercury down to 65 below zero for three days, 50 for one month, 40 for two months, and zero to 20 above for the rest of the season. How is that for high?

Fairbanks, Alaska.

WM. LAWSON.

[We should say, "How is that for *low*?" Well, we can't beat it in any portion of Uncle Sam's domain south of Canada. As to the heated room, if you can maintain a temperature of 120 F. for 24 hours, or 140 for 12 hours you might be able to liquefy the honey; but if it were candied solid, and there were a large bulk of it, the portion in the center might still be in a more or less solid state. Generally speaking we would advise melting a smaller quantity in a smaller vessel, and for a shorter time.

But say, friend Lawson, we should like to hear more about your Alaska bee-keeping. How do you winter in so cold a climate? What are your honey sources, etc.?—ED.]

#### A PLAN FOR FINDING BLACK QUEENS.

I have four colonies of Italians and nine of black bees which I wish to Italianize next season. I have so much trouble to find black queens that I wish to know if the following plan would work. Form nuclei of the Italians about swarming time, then set a nucleus over each black swarm with wire cloth between for a couple of days. Then set the old hive to one side and put the nucleus in its place till all field bees have left the old swarm. Then I can easily find the black queen and destroy her and unite the young bees and brood with the nucleus. Would the old black bees be likely to kill the Italian queens? Would it disturb them very much if done during a honey harvest?

Sodus, N. Y. MRS. WESLEY GRINNELL.

[The plan that you speak of would work, only we would advise that you cage the Italian queen at the time of uniting with the black bees. A much simpler plan of finding such queens is to use perforated zinc. If you own an Alley trap or entrance-guard, put it over the entrance, shake all the bees in front; or, better yet, move the old hive off its stand and put an empty one in its place with perforated zinc or entrance-guard over the entrance. Now shake all the bees in front, putting the combs in the new hive on the old stand, and, last of all, dump the bees out of the

old hive. The bees will rush into the new hive; and by closely watching you will shortly be able to see the queen in her vain endeavor to pass the metal. She may now be picked off and killed. Indeed, it is not even necessary to watch for the queen. Shake the bees in front of the hive, and then come back in the course of fifteen or twenty minutes. Most of the bees will have gone inside. The few that remain outside can be driven in with smoke, after which the queen can be easily located.—ED.]

#### DO YOUNG BEES KILL THE OLD ONES WHEN THEY CAN NO LONGER WORK?

I have been observing some things about bees which indicate that they "make way" with the old folks when they consider them past usefulness—i. e., the workers. Do they? I don't think I ever read any thing of the kind.

Cincinnati, N. Y.

EMMET B. KIBBE.

[Young bees never kill off the old ones unless they are structurally defective in some way. After a good heavy honey-flow there will be many bees that have so frayed out their wings by hard toil that they are no longer able to fly. These, the other bees will carry away and drop; and, being unable to fly, they can not crawl back. In this there is not the slightest trace of gratitude, but, instead, we have an illustration of the principle of the "survival of the fittest." Old bees in the hive that are able to go to the field may remain so long as they can gather nectar.—ED.]

#### CLOTH COVERS FOR EXTRACTORS NOT LIKED.

On page 1596, 1907, I notice an illustration of a cover for a honey-extractor. I am sorry to see you pass it by so lightly in your footnote, with the suggestion that a cloth top is "just as good," and that most bee-keepers use them. What I wish to say is, that such a cover as illustrated is almost a necessity, and a much-needed improvement, and, when properly made and closely fitted, is worth \$2.50 to any one who owns an extractor, and it need not cost to exceed one dollar in the making of the machine.

Not all have mouse-proof houses for machines; and I have found, in leaving a cloth over the machine over night, as many as four dead mice in my extractor. The mice readily gnaw holes through the cloth.

The cover illustrated, as well as an extractor, being capable of holding five or ten gallons below the reel, is a practical necessity. Of course, the producers can have these extras made after they get the machine, but at a great additional expense. I am simply disgusted with cloths and rubbers sent with machines.

Brighton, Col.

WALTER MARTIN.

[We should be pleased to hear from others on this point. If there is a demand for a mouse-proof cover it can be furnished.—ED.]

#### EXTRA-YELLOW ITALIANS.

I am sorry for the bad reports we read of the goldens. I find one on p. 988, Aug. 15. I find them the gentlest bees of all. My experience is that blacks are cross, hybrids crosser, Cyprians

crossest; Holy Land cross, dark Italians, if pure, good; the very yellow Italians the gentlest of all. Keep all positive black blood out of Italians for best results. I have only one cross yellow Italian colony out of 20. We have more golden or five-banded bees at present in America than we ever had before. They are gentle, winter well on summer stands, and are good honey-gatherers. This is my experience of about 12 years.

Bechtelsville, Pa.

H. M. MOYER.

#### HONEY-DEW FROM OAK LEAVES.

The bees in this section of country have been laying in honey-dew for a few weeks from oak leaves. Probably something in your next issue on this subject on how to treat the matter and prepare for winter would prove of great value to bee-keepers in general who are troubled in this way.

P. B. R.

Harmony, Minn.

[Honey-dew from oak leaves is very poor stuff for bee-feed, more particularly in your locality, where the winters are long and hard. It is probably too late now to extract the honey-dew, as that would destroy the symmetry of the brood-nest. You can, however, feed good thick syrup made from sugar, which would counteract to a great extent the evil effects of the honey-dew. In doing this it is wise to disturb the bees as little as possible. Feeding such bees in fall is casting bread upon the waters.—Ed.]

#### POLLEN IN EXTRACTING COMBS.

Last spring I put half-depth extracting-supers on five of my hives, and the bees filled the upper part of each frame with honey and the lower part with pollen. Please tell me the cause of this, and what to do with these fifty combs. They are on the hives yet.

H. R. McADAMS.

Greenville, Ill.

[Bees will very often gather an excess of pollen when pollen is plentiful and nectar scarce. We would not advise leaving these combs in the hive for winter. So far as possible a colony should have best sealed stores with little or no pollen, except that one frame of it should be left on the outside for early brood-rearing in the spring. Where one finds he has an excess of pollen in the combs in the fall of the year, we advise taking them out of the hives and setting them aside to be used in the spring for stimulative feeding.—Ed.]

#### HOW TO SECURE PROPER VENTILATION OF A HIVE THROUGH THE WINTER.

I have been giving some attention to bee-keeping for just a few years. I have read every thing that came under my notice relating to bees. I have experimented somewhat, and observed very closely.

There is one thing that troubles me more than any thing else; and that is, the proper hive ventilation for winter use—referring to outdoor wintering. I can keep bees warm enough; but to procure what seems to me proper ventilation is a question I have not seen satisfactorily explained. I have no difficulty in ventilating my own sleeping-room, for I sleep with two windows open, summer and winter. I have had considerable experience with horses, cattle, hogs, and poultry,

and have constructed barns with very satisfactory ventilation; but to ventilate a hive properly is another thing.

I am satisfied that many bees die in winter from no other cause than damp unventilated hives. I believe bees would come through the winter in much better order if kept drier and cooler rather than warm and damp, the same as poultry. I have been wondering why Mr. A. I. Root, with his long experience with bees, and his more recent experiments with chickens, could not make some suggestion on how to ventilate a hive properly. I wish to expel the bad air and dry the hive—not absorb it. How can it be done?

The standard eight-frame hive is 20 inches long. Would there be any objections to a hive 18 $\frac{3}{4}$  inches or 24 inches long, same depth and width? That is, would it make any difference with the working of the bees if a hive were shorter or longer than the standard?

Storm Lake, Iowa.

GEO. H. EASTMAN.

[You have struck on a much mooted question, and we are sorry to say that our authorities do not agree as to how the hives should be ventilated, either in the cellar or out of it, during winter. But the general consensus of opinion in the case of outdoor-wintered bees is in favor of a restricted entrance, say about 6 inches long by  $\frac{3}{8}$  deep. If the colony is not very strong, 3 inches long by  $\frac{3}{8}$  would be better. Experiments where the entrances were entirely closed by wire cloth or a small bundle of straw have usually resulted disastrously for the colonies.

The latest tendency now seems to be toward shutting out the chilling blasts from prevailing winds and direct sunlight, and yet at the same time allow perfectly free ingress and egress of the bees.

For indoor colonies, some of our correspondents say the whole bottom of the hive should be open; but of late we have noticed quite a strong tendency toward leaving no more bottom ventilation than is afforded by the ordinary hive-entrance, such as would be used in the fall or spring. Our own experiments decidedly favor the common entrance rather than have the whole bottom of the hive exposed.

You are right, that dampness is the bane of successful wintering, either indoors or out. That is the reason why it is not wise to restrict the entrance too much, for there must always be a chance for the moisture to escape.

Changing the dimensions of the hive would make no difference with the bees, but it would increase the cost of supplies and make no end of confusion for you. Better not do it.—Ed.]

#### SHOULD NEW CANS BE SCALDED?

Is it necessary to scald new 60-lb. square cans before putting honey in them? I have been scalding them; but if it is not necessary it would save a lot of labor. Do you rinse them with hot water before using them?

J. P. MOORE.

Morgan, Ky.

[As a general thing we would advise rinsing out a new square can, to remove the residue of any soldering-salts that may be left. Boiling water would, of course, be better. We should like to know what is the general practice of producers in this respect.—Ed.]

# OUR HOMES

By A. I. Root

Thou shalt not commit adultery.—Ex. 20:14.  
Her house is the way to hell, going down to the chambers of death.—PROV. 7:27.

Some time ago, while in the city of New York, I had a chat with Mr. Collingwood, the editor of the *Rural New-Yorker*. I told him one great reason why I recommended that paper more than any other of our good agricultural papers was because it was taking the lead in fighting humbugs and frauds, and iniquity of every sort wherever it crops out. I have often thought of the reply Mr. Collingwood made. It was in substance something like this:

"Mr. Root, I do not enjoy that kind of work. I dread it, and oftentimes go into it very reluctantly; but when I feel that the Lord calls on me to go down into Egypt, I am going to go down—that is, when I am sure it is my duty for the good of the people, even though I sometimes go very unwillingly."

Now, dear friends, I too dislike "going down into Egypt;" and some of you may think that the matter I am going to discuss to-day might be, a part of it, left out; but after thinking it over, and praying over it, I have decided that God wants me to hold up a warning.

In our issue for Sept. 1, page 1081, I said the marriage relation should be regarded as the most sacred and solemn thing between birth and death; and I wish to emphasize that fact by two sketches from real life.

Years ago, when I was exhorting all my friends and acquaintances to choose the Lord Jesus Christ for counselor and friend, I became acquainted with a young man who worked for me, and I had several talks with him. A little later his father also came into my employ. They came from a neighborhood where Christianity was at a rather low ebb. I think spiritualism had been prevalent in that region for a number of years, and religious matters had been put in the background. After several talks with these two people, I had the satisfaction of getting a promise from both of them to make at least a start in following the Savior. If I am correct, both of them gave me their hand as they gave me the promise. I can not remember now whether that promise included coming to our meetings and standing up before the world, as an indication that they were going to give the matter at least a trial; but I fully expected to see them both take such a public stand. I can not tell whether the father came to the meetings or not. The son did, but, if I am correct, he did not get quite to the point where he stood up or took part in any meeting.

Not long after this talk, while the father was busy at his work, a young woman who worked for a family near by came out and spoke to him. They were not acquainted at that time. He may have noticed her in passing by where she was employed, and I am afraid that, even though he was the father of grown-up children, he had been so careless as to cast perhaps admiring glances toward her. Oh dear me! As my mind goes back, and I think it over, I am afraid there are other fathers

of families—yes, and perhaps professing Christians—who are so careless or thoughtless as to cast admiring glances toward women other than their own wives, especially if such women take pains to *invite* such glances of admiration. Well, this young woman left her work that morning and stopped this father as he was going by and said something like this:

"Mr. Brown, perhaps you know there is going to be a circus over at — next week. Now, I should *awfully* like to go, but I can not very well go alone. Would you not like to get off a day and go to the circus\* with me?"

Surely this was a bold proposal, or at least some people would consider it so. Others might think there was no particular harm in it. These two persons might get on the car at the same time, and if they did not sit in the same seat nobody would think any thing about it. When they got to the circus in a strange city, where nobody knew either of them, their presence together would be unnoticed, and they might get back home and nobody know any thing about their being together. When I afterward remonstrated with the father about what he had done, *especially* after the promise he had given me, he maintained that there was nothing particularly wrong about their going to the circus together in the way I have described. He said in substance:

"Why, Mr. Root, there is hardly a man going along the streets who would refuse to go to a circus with a nice-looking girl when she went out of her way to ask him to go with her as a favor."

But in closing I said:

"But, Mr. Brown, do you think that a married man, the father of grown-up children, ought to go off in that way with a woman who is almost a total stranger to him?"

He replied that, putting it that way, perhaps it was not just the thing to do; but he did not think very much about it at the time, and had no idea any harm would come from it.

Now, I hope you will excuse me if I talk plainly, and tell you right out in print what harm *did* come. They did not get away from the circus as they expected to; and when they did leave they were obliged to take a train that would not get them home that night. They had to stop over at a station part way. Now, I do not know who made the first suggestion, but I do know that the elderly man and young woman stopped at a hotel at that place as *man and wife*, thinking that nobody would ever make inquiry, and that it would never be found out; and it was not found out for several months afterward. What abject folly! what *could* those two people have been think-

\* Some of my friends—yes, even good Christian people—think me a little singular because I shudder at the very mention of a circus. Please notice, this woman did not invite the man to go with her to a Sunday-school convention nor even to a county fair. The circus was just the place for her undertaking. This man was a great lover of horses, and she knew it. He was an expert in handling a fine team; and by the way, the horses in the circus are an excuse for many good people to attend. I suppose the world has mostly forgotten the book called David Harum, and I am glad that it went so quickly out of sight. Now, David Harum not only made light of religion, and held up church deacons to ridicule in his opening chapter, but later on he put in a most eloquent plea, not only for letting boys go to the circus, but *encouraging* them to go. Now mark my word: When the saloons are banished from this State, Ohio is not going to be the popular "hunting ground" for circuses that it has been in times past; for *gamblers and bad women* are going to decamp also when the saloons disappear.

ing about? When I first heard of it I said it was incredible, and I would not believe it till Mr. Brown himself confessed it. Why, it seems that either one of them or both had lost their senses, or at least have lost all sense of decency and propriety before they considered such a step, or, to call things by their right name, before they voluntarily decided on *committing a crime*, not only in the eyes of God but against the laws of man as well. And, by the way, I think such a thing has happened at least half a dozen times here in our locality within my recollection. Two people have gone to a hotel, and the devil has persuaded them that, by signing fictitious names, they could evade discovery. So far as I know, in every case the thing was found out sooner or later. "Murder will out;" yes, and so will adultery. And, thank God, these things *do* get out—at least a great deal of the time, and the criminals have to suffer ever afterward the condemnation of all good people. This man was living at peace with his wife and family until this event occurred; but when the wife found it out, perhaps he confessed it and begged her pardon. I do not know how that was; but I know he bitterly regretted his folly. If I am correct he was never guilty of any thing of the kind before this event, and certainly never was afterward. He was one of the kindest and most genial men I ever met. He tried to make up by a straightforward, upright life for the sins of the past; but his wife refused to forget or to forgive. She said that either he would have to leave and go somewhere else or she herself would do so. Perhaps she had scriptural authority for her course, and yet I feel sure she made a mistake. Whenever a man or woman seems truly penitent for even a sin of *this kind*, and starts out to live an honest life afterward, I think the partner of such a person should forgive and forget the past; and I am sure there is nothing in the Bible contrary to my position in regard to the matter.

Long years passed by. At different times I urged that the father be permitted to go back home, and he finally did go there and stayed a few weeks; but his wife soon decided he would have to go away again. She said the sight of him brought back again the old bitter memories, and he would have to go away somewhere out of her sight. Once more, dear friends, I dread to tell the ending. It can be told in almost one word. That aged father finally died a suicide. Do you think that the second one of our texts is too harsh and severe? That young woman who fixed herself up so as to look attractive (before she went out to see a man old enough to be her father), perhaps had no thought of any thing so serious and terrible as what I have just been relating; and yet this thing she had planned certainly *was* "on the road to hell." She broke up the family, brought misery and unhappiness untold into that household, and the end was, as we have it in our text, "going down to the chambers of death."<sup>\*</sup>

<sup>\*</sup>I do not know how many other families were ruined and broken up by the schemes of this woman. I only know that she made a remark once to a young girl in her teens (when this girl was shocked at her familiarity with men in general), something like this: That, according to her ideas, about all the satisfaction or fun that this world has to offer is along the line of what might be called indiscriminate flirtation with the opposite sex, married or unmarried—it did not matter very much which.

God grant that this little story may be a warning to men and women, both old and young.

My second illustration is, in some respects, a sadder one still. Years ago I became acquainted with a boy who in many ways showed marked ability. I plead with him to go to Sunday-school and to become a Christian; and part of the time I thought he was on the way to the "promised land." I finally lost track of him; and as he had a bent toward mechanical work he left the farm and spent one winter in a nearby city. When I heard of him again, somebody told me he had got into some bad habits. Before he went to the city to work I had him one time at work out in the woods with a hired man. This latter man was rough and profane, and the boy finally spoke right out and said something like this:

"Mr. Root, I like to work for you, and I am well satisfied with my pay; but I am not in the habit of being sworn at, even if I do not understand every thing; and I have been brought up where I did not hear any swearing at all. Now, I hope you will excuse me when I say that this man, who bosses the work when you are not around, must either stop his bad talk or I shall have to look for another job."

I put my hand on the boy's shoulder and told him I admired his spunk and grit; and after a pleasant talk with the hired man I told him he really would have to stop his swearing while he was on my premises. Now, that very boy, after being in town just one winter, *had learned to swear*. I could not comprehend it. I found him out in the field at work one day; and after shaking hands with him I said, "John, do you remember how you once refused to work for me any longer unless I made that man stop swearing?"

He said he remembered it well, but he rather hung his head.

"Well, John, what in the world has changed you, and your opinion of people who swear, to such an extent that you are now addicted to the very thing you were so vehement against only two years ago?"

He said he did not know exactly what had made the change.

"Why, John," I continued, "it seems to me that the Devil himself has somehow crept into your young and boyish heart and caused such a change in just one short winter."

About this time John was either crying or came pretty near it; and he owned up to me, in a general way, that Satan *had* probably got hold of him. I got him to go back to the Sunday-school, and he soon became a leader in the prayer-meeting and in all Christian work. The boy was literally born again, and everybody was surprised at his piety and devotion.\* When the good pastor who had united with me in getting John

<sup>\*</sup>I am told that this same girl met John one day on the street, after he had united with the church. He evidently had little or nothing to say to her—perhaps did not even recognize her. Then she complained to some of her acquaintances that since John had got religion he did not amount to any thing at all. He could not even be civil to his old friends when he met them on the street. May the Lord be praised that John did have sense enough, after he had been born again, to shun this evil woman as he would turn out of the way of a mad dog. Hydrophobia may bring suffering and death; but it is not to be compared in its final results with the one who poisons mind, body, and soul, and leads her victims "in the way to hell," and "down to the chambers of death."

into the church and Sunday-school and Endeavor Society went away I had some fears that John might slip back; but my fears were groundless. He held fast to his religion all the same, and stood by the new pastor. He exhorted everybody right and left to come to the "Lamb of God who taketh away the sin of the world." I wish, dear friends, I could stop right here and not tell the rest. But this story is going to have *another* chapter about going down "the way to hell." I have told you in times past that we might find heaven here on earth; and now I want to tell you it is *also* true that we may find *hell* here on earth as well as heaven. Poor John! in that one short winter he got a taste of hell that will probably cling to him and follow him through life. During that winter a bad woman or girl a little older than himself came in his way. He was from the country, as she well knew, and comparatively innocent and unsuspecting. After a brief acquaintance with this woman *he learned to swear*. Do you wonder at it? When I found him and pointed out to him the Lamb of God that taketh away the sin of the world he was in trouble. He listened to me like a drowning man catching at a straw, and, may God be praised, it was something more than a straw that I had to offer. I dare not put on paper the revelation that came to me later. While John's sin was forgiven and blotted out, the *consequences* of his wrong-doing during that one winter will probably follow him through life. He consulted a physician, but it was too late. He is now in an asylum for the insane, and the doctor thinks it is doubtful if he ever recovers his reason.\* But we are praying for him, and we know that the power of Christ Jesus to "cleanse and save" is away beyond and above all that all the doctors of the world with all their knowledge have ever yet accomplished.

Now, my friends, can you not agree with me that God knows best when he says, "Thou shalt not commit adultery," and that the words of our text are not at all too severe when he says that "her house is the way to hell, going down to the chambers of death"?

---

GREAT NAVIES TO MAINTAIN PEACE; MORE ABOUT IT—SEE PAGE 1156.

I clip the following from the Omaha *World-Herald*:

BUILD UP SCHOOLS, NOT BATTLESHIPS.

CROOKSTON, MINN., Sept. 17.—"If I had my way I would build a couple of warships less, yet one would be enough; and I would take the \$5,000,000 which it would cost, and with it construct 1000 schools of agriculture in the United States," declared James J. Hill, Chairman of the Board of Direction of the Great Northern Railway, at the dedication of Stephen Hall, an agricultural institution, here to-day. Mr. Hill stated that, with the present birth-rate, the country will not be able to take care of its own people, let alone the prospect of exporting grains to Europe, unless the farmers study the science of agriculture and learn how to raise more bushels to the acre than they are able to do now.

I wish to express a hearty amen to the sentiment expressed in the above. May God help us, especially those of us who profess to be trying to live under the motto, "In God we Trust." May

---

\*Permit me to say here in this footnote that the saloon business, especially that part of it where they exhibit to boys indecent pictures, and encourage the work of bad women, has more to do in filling our insane-asylums and infirmaries than any other one thing in our nation or in the world; and may God be praised for the many signs that these places of filth and abomination will soon be banished from our land.

that same God in whom we are trusting help us to teach our children how to raise *wheat* in order to relieve the starvation that is *still* going on in this wide world, instead of building more battleships

With the banishment of saloons from the face of the earth, the need of battleships to preserve peace throughout the world will be very much lessened. I wonder if this has occurred to our good President while he is so vehement in urging the enlargement of our navy.

By the way, I wonder if it occurred to the *World-Herald* that they have Bible authority for the position they take. Look at this: "Wisdom is better than weapons of war."—Ecc. 9:18.

Here is something more on the same subject:

"WISDOM IS BETTER THAN WEAPONS OF WAR."

We take pleasure in submitting the following from the Chief Justice of the United States, which we copy from the *American Missionary*:

JUSTICE BREWER ON THE GLORY OF THE NATION.

"The glory of this nation is not in its increase in armament, but in its present course of sweet peace. Well do I know that many of our greatest thinking men contend that this nation should build up a great navy and a mammoth army in order to maintain its prominent and respectable place among the great nations of the world. I have no hesitancy in saying that our nation is making a grave mistake in its effort to build up a monster navy. It is uncalled for. We don't need it. We are 3000 miles from the nearest nation, and there is no danger of being molested."

---

## HEALTH NOTES

---

NUTS AND APPLES.

I have several times spoken of the pleasure I experienced in having one or more apple-trees around the home, having apples that ripen from the very earliest until the very latest of the long-keeping sorts, and seeing the earlier ones get luscious right under your own eye where you can pick them daily from the trees. Well, just lately I have been having nuts from my own nut-tree. When we commenced to build our house there was a little shellbark hickory close to the kitchen door. I wanted to cut it down, but Mrs. Root said, "No, no!" Well, even after the tree got big the nuts were so small and few in number that I again suggested having it cut down. Mrs. Root said she loved that particular tree as much as if not more than any other tree on the place. Well, two or three years ago I commenced having a compost-heap (in order to prepare soil for my greenhouse) under and around this hickory-tree. I hauled sod from the roadside, and chopped them up with old well-rotted stable manure. Then I got several loads of sweepings from the streets, and cut it down and shoveled it in, and worked it over and over until I had nice potting soil for the greenhouse and for my flower-bed, and the children's and grandchildren's around their homes. This summer I placed one of the little poultry-houses, of which I showed you a picture, under this hickory-tree; and in order to test the sprouted-oats theory I leveled off my compost-heap and sowed the oats in the rich soil at intervals, letting the chickens help all they liked. The result was (or is) that the ground all around under that hickory-tree is a rich mel-low compost, constantly stirred over and over by

the chickens digging up the sprouted oats. What do you suppose happened? Well, the nuts this year are larger, finer, and earlier than ever before. In fact, they are the finest thin-shelled hickorynuts I ever got hold of. And, by the way, I saw in one of the agricultural papers that you can make any fruit-tree bear larger and finer fruit (and do it every year, without any off years) if you will just *feed* the tree and keep the ground loose and mellow all around it as far as the roots extend. The droppings from the little poultry-house are taken out every few days, and pulverized and mixed in with this spread-out compost-heap so as to grow still more thrifty and luxuriant sprouted oats.

Now, after each meal of grains and milk I go out by the doorstep and sit down in the shade with a nice light hammer, and get my nuts right from nature, without the intervention of any "middleman" for that part of my *menu*. Speaking about nature reminds me that a gray squirrel makes several trips to that hickory-tree every day, and he shells and rattles down about a dozen nuts for every one he carries off. The weather is so dry that the nuts ripen and shell out a week or two earlier than they usually do. In fact, this year they all bid fair to drop off before we get a bit of frost. It is just rare fun for the grandchildren and myself to go out every morning and gather the beautiful white-shelled nuts as they drop into the rich black compost at the foot of the tree.

Just now I believe I prefer hickorynuts to any other kind I ever got hold of—at least the nuts from this particular tree. And while so much is said about cultivating and growing pecans, why in the world does not somebody make a selection of the finest thin-shelled "shellbark" hickorynuts, and encourage and develop them, just as I am doing with this particular hickory-tree? I presume you might get a pretty good-sized hickory-tree from the forest and plant it in your dooryard. My chestnut-tree is not bearing this year, and I fear it is because I have not given it the care and cultivation I have given this particular hickory, and that, too, almost by accident. By all means have a good generous compost-heap somewhere in the back yard, and have it large enough, and stirred over often enough, so you can push any plant or tree about your home.

#### CAN NOT EAT HONEY OR APPLES.

Dear old A. I. R.:—As a health note, may I ask you why it is that every time I eat honey I am afflicted with a headache—almost identical with the "feel" of an ache I get from eating apples? I am fond of both, and yet can not eat either of them.

Yonkers, N. Y., Sept. 10.

E. C. BISCHOFF.

My good friend Bischoff, I am under the impression that you are only one of thousands of other people who have the troubles you mention from eating either honey or apples; and by eating these together you probably have found they make a "bad combination." Now, I am not a doctor, and I shall, perhaps, be working in the dark; but the *probability* is that you do not have enough outdoor exercise, or that you are eating more than you need, and have likely been doing so for a long while, and now you have a sort of chronic fermentation of the bowels. I have been fighting the same thing for years; and when I

get in pretty good trim by avoiding such things as distress me, I find I can eat a *little* honey and not produce any bad results. For instance, make an entire meal of bread and butter and honey, and, say, half a cup of milk, but do not eat more than half of what you feel inclined to eat. Break away from the table when your meal is just half over. For a while you will feel half starved, and be tempted to say you do not believe in any such doctrine; but after a while you will get over it and you may be surprised to find, when next meal time comes, you are not as hungry as usual. Now, I would not take honey again the next meal. Do not tempt your old trouble. Eat something else that agrees with you. In my case it would probably be a Hamburg steak, with just bread and butter, or, better still, rolled wheat. When you find that one small meal with honey has not brought on the headache you can try it again; but be careful. I am very fond of new maple sugar; but it almost always gives me a headache. One day when I was up in the cabin in Michigan I had nothing on hand for dinner but warm sugar and some dried bread. Now, I ate a pretty good dose of this hot maple syrup with my dry bread, just at the regular dinner hour, and I did not have any headache at all. If I take warm sugar right after a good meal, as people usually do, I have the headache sure.

Now, after you have mastered the honey business, and found you can eat it in small doses, try making a meal, say your supper, mostly of apples and bread and butter, or apples and wheat. The Battle Creek folks recommended, some years ago, that people who can not eat fruit would find that, if they made a whole meal of it, eating the fruit without sugar or any thing else, they would have no trouble; and as soon as I read the above I made a supper of baked apples—not another thing. It is true I did not feel quite satisfied; but an hour or two after my meal I felt all right, and slept unusually well. The great trouble is, we eat the honey and the apples after Nature has been pretty well satisfied; and the worst part of it is, we keep on doing it until our digestion is all out of joint, and it takes a long while to get back again. Take only a few different things at any one meal, and not too much of these few. It will not hurt you to go hungry a little while. After you find that Nature will get accustomed to the scant menu, you will feel better than you ever did before. Try it, and see if I am not right.

Now, brother B., be very careful not to put any thing into your mouth between meals except water; and particularly do not taste of an apple or any honey. Just a very little sweet will keep this fermentation going when it once gets to be a chronic trouble. Now, as an illustration of what real health means I wish to quote once more from T. B. Terry in the *Practical Farmer*:

#### WORK A PASTIME AND LIFE A JOY

Study to lighten the body. Make it warm itself more. Every detail in this article has been followed by the writer systematically for several years. The reward is great. Many others are doing about the same. I am glad to give one delightful report from a woman who does not wear a corset at all. She lives on a farm, and tells of sleeping full time with all windows and doors open, etc., then adds: "I believe I never before got quite so near nature as I have this summer. I revel in air baths, sun baths, and cool-water baths at all possible opportunities. My clothing is loose and light. And how good all this makes me feel! What a fine thing it is to see stacks and stacks of work and

feel equal to it all! Mornings I feel something as an engine must when pressure of steam raises the safety-valve, only I can vent my strength by pushing the work, and work seems to me now like play. It is a delightful pastime." Few women work as hard as this one does. An old report from her tells a different story. Others who will live more simply and naturally can attain to this perfect degree of health which makes work a pastime and life a joy.

## HIGH-PRESSURE GARDENING

By A. I. Root

### ALFALFA AND LIME.

Mr. Willis O. Wing, the great alfalfa king of Ohio, tells us in the *Ohio Farmer* that he has made a wonderful discovery in regard to alfalfa. This discovery is that alfalfa needs lime—must have lime in the soil where it grows to perfection, and it wants more lime than any of the other clovers unless it is sweet clover. In fact, alfalfa and sweet clover grow most luxuriantly on soils that have enough lime or other alkali to kill out ordinary plants and other clovers. Your ground needs to be well underdrained for alfalfa or any thing else, and then it should be fertile. Any kind of manure suits the plant. But the underdraining and manure are not all. The main thing is lime. Use lime at the rate of even six tons to the acre, either burned or unburned, and then you can grow alfalfa anywhere; and you ought to get a ton of alfalfa hay for every ton of lime you put on the land; and after you once get the alfalfa started it is good for the rest of your lifetime—that is, with ordinary care. This matter interests bee-keepers particularly, because the same thing applies to sweet clover. Just as soon as I read it I remembered seeing sweet clover growing with such wonderful exuberance on the alkali soils around Salt Lake City, and I have repeatedly told you, as you may remember, that, after sweet clover has got a foothold, it sweetens the soil so it will grow any thing else. Both Prof. Thorne and Green, of the Ohio Experiment Station, said to me just a few days ago that the farmers of the world need to wake up to the fact that sweet clover will grow on ground too poor for any other plant; and not only that, sweet clover has the wonderful property of making poor worthless land available for any other crop. You may remember my telling about getting a fine crop of potatoes on hard yellow clay, such as is thrown out by the side of the railroad, where they made a twelve-foot cut. Sweet clover got in on this heap of poor yellow subsoil clay; and after it had grown there for several years I plowed it under and planted my potatoes; and yet there are some people even now who talk about sweet clover being a "noxious weed." Read the following extract from the article referred to:

"How much lime?" "One hundred pounds to the square rod; that is little enough," I replied. The man hesitated at that, and balked just a little. One hundred pounds to the square rod is eight tons to the acre. He put on six tons. He inoculated the soil with other soil from a good alfalfa-field. He sowed alfalfa. He got six tons to the acre the next year, and all his neighbors came to see the miracle that had been worked. That lime cost the man about \$12 per acre. His six tons of alfalfa hay were worth to him at least \$100 to feed his cows, so it paid him immensely, did it not?

## POULTRY DEPARTMENT

A POULTRY-HOUSE ENTIRELY OF CLOTH; POULTRY-HOUSES IN GENERAL, ESPECIALLY FOR FLORIDA AND OTHER WARM CLIMATES.

You know I have been for some time keeping poultry in Florida, without any house or structure of any kind, and I claimed that none was needed. However, when I came to separating my cockerels from the pullets I found it was a difficult matter to climb into the pine-trees and get them off from the roost. Besides, there needs to be some sort of shelter to keep your grain and other feed dry; and it is rather desirable, also, to have the nests where they will not be soaked by rain. To get the best price for our eggs we want them clean and bright; and the only way to do this is to have nice dry nests under some sort of shelter, and gather the eggs once a day or oftener. There are times, also, even in Florida, when the fowls would get under some kind of shelter if they could find it. While considering all of these matters lately, I have wondered a good many times if some sort of cloth tent would not answer every purpose. Perhaps some more substantial roof would need to be over the feed-bin. The whole poultry-world is now pretty well agreed on the cloth front or muslin curtain on account of ventilation.

Well, after having all of these things in mind for some time past, you can understand with what avidity my eye caught on the following, which I clipped from the *Rural New-Yorker*. In fact, I read the article over and over again. Here is the clipping:

Some readers of the *Rural* may remember that last winter the experiment was tried at Storrs College of keeping White Leghorns in a tent, such as can be bought from the Chicago mail-order houses for \$6.00. August 25 I was at Storrs, and saw those same birds still living in the same tent, a handsome cock and eight hens, and, so far as I could see, not the tip of a comb on any one of them had been touched by frost. I inquired as to the egg production, and was told that the eight pullets had laid from five to six eggs a day, and sometimes eight. I looked in the tent at about 3 o'clock, and there were six eggs in the nest then. The birds are not confined to the tent, but have the full run of a grassy yard. Beef-scrap and a dry mash which is partly of cut clover are kept by them all the time. This would seem to be a wide departure from the old way of "extra-warm houses to make Leghorns profitable;" but it is in seeming only, for it was stated that "it was warmer last winter inside that tent than in any poultry-house on the place." The air was pure, the ventilation perfect. We had a temperature last winter of 4° below zero on several mornings; and that none of these Leghorns had their combs frozen was almost incredible. The only furniture in the tent, aside from the feed-boxes and drinking-fountain, was a large box about two feet high, on the flat top of which the birds roosted, no perch being provided.

After reading it I went and got Montgomery Ward & Co.'s catalog, and found that they advertise a tent made of 8-oz. duck, 7×7 ft. inside, 3 ft. high at the eaves and 7 ft. to the ridgepole, which is probably the tent alluded to in the item above. I wonder if we are to understand from the *Rural* that only eight hens and a rooster kept there inside all last winter better than in any other poultry-house on the place. If this is true, the tent was probably closed up very tight—that is, there were no openings to permit a draft. The nine fowls warmed all the air inside, and the gradual change of the air, without any draft of air, gave abundant ventilation. If this is

true, why in the world do we want any cheaper material for poultry-houses than cloth? and we certainly can not get any thing *lighter* to move about than a cloth tent. Why, I was so much taken up with the result of the above experiment that I felt a strong inclination to start right off on a trip to York State just to see that successful poultry-house made of cloth alone. Who can tell me more about it?

#### ANOTHER WONDERFUL SECRET.

We clip the following advertisement from the *Woman's National Daily*:

EGGS! EGGS!! EGGS!!! Do you want plenty of eggs all winter when prices are high? Then get the Great Russian Method of feeding hens. Feed costs only 10 cents a bushel. The greatest egg-producer in the world. Send 25 cents for secret information how to make it yourself. The Russian Egg-Food Co. Agency, Box 147, New Berlin, Pa.

Who does not want eggs just as winter is coming on? Well, here goes another venture for the wonderful secret, and below is what I got for my 25 cents:

#### THE RUSSIAN METHOD OF FEEDING FOR EGGS.

Take one quart of oats;  $\frac{1}{2}$  pint each of wheat and corn; mix in in a bucket; cover with cold water for 24 hours. Then pour off the water, put the grain in a wooden box, three or four inches high, with loose bottom, to drain off superfluous water. Put grain about one inch deep in the box. Wet it every day. In a few days it will begin to sprout, and in eight days it will be ready to feed, tops being about six inches high, and the sod two or three inches thick.

Cut a piece of sod about six inches square for every twelve hens. Feed green tops and all. This furnishes green food all winter for hens, and they devour it greedily, while the grains, being soaked soft, are an excellent grain food. Place a fresh supply of grain to soak every second day.

This method makes five or six times the original amount of grain, and is the cheapest and greatest egg-producer ever tried.

THE RUSSIAN EGG-FOOD AGENCY,  
New Berlin, Pa.

Very likely the above may be worth 25 cts. to a good many people who do not know any thing about sprouted grains, especially in winter, when there is a lack of green food; but after working it quite a spell I think you will find it is quite a little trouble to give it attention every day. I think the *Rural New-Yorker* (or some other periodical) says when a busy man counts his time he will find it costs about as much as to raise a crop of oats in the ordinary way. Yes, you *will* have five or six times the amount of coarse food; but how much more is it worth, to keep fowls from starving, than the grain was before it sprouted?

## TEMPERANCE

#### THE UNITED STATES GETTING DOWN TO BUSINESS.

GLEANINGS IN BEE CULTURE was the first periodical on the face of the earth to announce that men can fly, and to give full proof and particulars, notwithstanding the *Scientific American* now comes out declaring *they* first announced it to the world, etc. Well, GLEANINGS was one of the first to suggest that Governor Hanley, of Indiana, should be our coming President; and every time I have heard him speak I have been more and more impressed that he is the man chosen of God, if not *just yet* chosen by the American people. In the *Indianapolis News* for Sept. 16 we find the following:

HANLEY WILL PART COMPANY WITH REPUBLICANS IF THEY JOIN BREWING INTERESTS.

MUNCIE, IND., Sept. 16.—In a speech made at Albany, Ind., yesterday, Governor Hanley made the solemn declaration that if his party joins interests with the brewing companies and saloons he will part company with it. The declaration was made before a crowd estimated at 2000, and it was vigorously applauded. Lifting his right hand, Governor Hanley said:

"So help me God, if my party comes to Indianapolis and joins hands with the brewing interests, the saloon-keepers, and the distillers, on that day I want out of it; and if your party joins hands with these same interests, you ought to walk out of it."

There! can either Taft or Bryan say as much? If not, they are not fit for the sacred office of chief magistrate of this great republic; and I am confident that the majority of the voters of this country will stand by me if they have only a fair chance. What do you think about it?

On page 1086, Sept. 1, we said that President Roosevelt, at least some time in his life, gave utterance to a sentiment that comes pretty near Hanley's present declaration. The question is, "Can President Roosevelt right now in the present crisis indorse and subscribe to the quotation on the page referred to above?"

#### UNCLE JOE CANNON; HIS PROFANITY, OPPOSITION TO TEMPERANCE REFORMS, ETC.

A year ago or more, in talking with Superintendent Baker, of the Anti-saloon League, I told him I thought it was a burning shame that such a man as Cannon should be permitted any longer to occupy so important a position so near the head of our government. Baker replied that, while he agreed with me, we should bear in mind that, just at present, the Anti-saloon League was fighting the saloon, and not blasphemy in particular. Since then we have had proof again and again of the way in which "Uncle Joe" has side-tracked our temperance laws, to say nothing of parcels post and postal savings banks. Meanwhile the Methodist Church has come to our aid. See the following, which I clip from the *Woman's National Daily*:

#### DENOUNCE CANNON'S PROFANITY.

At the closing session of the Rock River Methodist conference Speaker Joe Cannon was roundly denounced for using "unequalled profanity" and opposing temperance legislation. Rev. J. K. Shields, superintendent of the Anti-saloon League, said: "What is Joe Cannon? Just a few days ago I met a young lawyer whom we had sent down into the State to talk temperance. He told me that he had met Uncle Joe in a car, and had ridden with him for quite a while; and when I asked him for the impression that Uncle Joe had made, he said: 'Shiel's, I have heard vilest from the mouths of many men; but the profanity that streamed from the lips of Joe Cannon I never heard equalled.'"

#### SHALL OUR BOYS BE ENCOURAGED IN THE USE OF GUNS?

We clip the following from *Our Dumb Animals*; and we will only add that we are in hearty agreement with the sentiment of the clipping:

#### BOYS' BRIGADES.

A friend, calling on us the other evening, said he met a Sunday-school boy belonging to one of the Boys' Brigades, holding a gun. He remonstrated with the boy in regard to the shooting of birds; but the boy at once replied, "President Roosevelt does it," as though that were conclusive on the subject. Now, we have thought that President Roosevelt's proposed visit to Africa to shoot, wound, and kill animals he may find there would be less harmful than some other things. But the newspapers are now staring that he is to receive an enormous price from some publishing firm for writing an account of all his shootings, which may get a circulation of millions among American schoolboys, and stimulate in them all an ambition to use army rifles and follow the example of their distinguished adviser. We have no doubt if Roosevelt does this it will bring to him personally a large amount of money; but what the effect will be on millions of schoolboys in America is another and far more important consideration.

## Let Us Tell You How the Farm Tele- phone Pays

### These Three Books

which we will send you free, explain why a Telephone on the Farm is a good investment. How it saves time, money and labor. How you and your neighbors may install the finest system there is, at reasonable cost, just as hundreds of thousands of other progressive farmers have

## THE LORE OF THE HONEY-BEE

BY  
**TICKNER EDWARDES**

author of  
"THE BEE-MASTER OF WARRILOW,"  
"AN IDLER IN THE WILDS," ETC.

SETTING aside the many popular technical treatises on bee-keeping, there is at present no work by a modern English writer dealing with this fascinating subject, from the literary and antiquarian, as well as the scientific point of view. Succinctly, **The Lore of the Honey-Bee** is a history of bees and their masters from the very earliest times down to the present. The wonderful communal life within the hive is touched on in all its varying aspects; and the reader is introduced to a class of men from all ages as quaintly original as their calling is inimitably picturesque. The book covers the whole field of ascertained facts in the natural history of the honey-bee, as well as the romance of beemanship past and present; and nothing better could be put in the hands of the beginner in apiculture, no less than in those of the advanced student of what is probably the oldest human occupation under the sun.

All queens now go by return mail. Safe arrival and pure mating guaranteed. We employ 400 to 500 swarms. Can furnish bees on L. or Danz. frames. Add price of whatever queen is wanted to nuclei or colony. No order too large, and none too small. Over 20 years a queen-breeder. Address all orders to

**Hurry in your orders as this is the last time this ad. will appear for this season.**

QUIRIN-THE-QUEEN-BREEDER, Bellevue, Ohio.

## 5000 QUEENS

of the famous 3-banded LONG-TONGUE RED-CLOVER STRAIN OF ITALIAN BEES is what I want to sell this season.

My bees GATHER HONEY if there is any to get; ARE LITTLE inclined to swarm and sting; they please such people as The A. I. Root Co., R. F. Holtermann, W. Z. Hutchinson, Morley Pettit, etc., and if they don't please you, send in your kick.

Queens of all grades now ready.

**W. O. VICTOR (Queen Specialist), Hondo, Tex.**

## NOW IS THE TIME

to buy your queens for fall increase. I can mail promptly young vigorous queens—Italian, Carniolan, Banat, and golden. Prices, untested, 75 cts.; \$8.00 per dozen; tested, \$1.25 each; \$12.00 per dozen.

Circular free.

**Grant Anderson, Sabin, Tex.**

## Long-tongued Red-clover Queens

**Bred by their Originator**

Do you want to get some specimen queens of the world-famous red-clover stock of Italian bees? Then buy from me, because I am the originator, and surely ought to know how to breed them in their purity. When you get them from me you know you have the real strain. For years I have devoted time and skill to this stock, trying to reach perfection. I can submit many splendid testimonials in favor of this stock to show my work has not been in vain. Try them, and YOU will be pleased also. I endeavor to please the practical man looking for definite results in dollars and cents. Many years' experience as head apiarist of The A. I. Root Co. enables me to fill the most exacting order with complete satisfaction to the purchaser. Let me show you how well I can please you.

**F. J. Wardell**  
Uhrichsville, Ohio, U. S. A.

## 25 PER CENT REDUCTION.

Here is your chance to save money and get a lot of the best queens cheap.

Introduce LAWS queens this fall and thus insure a full crop of honey the coming season.

LAWS queens are sent everywhere, and everywhere there are words of praise for them.

One firm alone has bought over three thousand of the LAWS queens during the past six seasons.

Deduct 25 per cent from the following prices; remit the balance, and your order will have prompt attention.

Single queen, \$1.00; six for \$5.00; dozen for \$10.00.

**W. H. LAWS, Beeville, Bee Co., Texas**

## Wax Craft

By T. W. COWAN

We are now in position to take orders for the above book. It is elegantly bound and beautifully printed. See review by W. K. Morrison in last issue.

Price \$1.00 postpaid anywhere.

**THE A. I. ROOT CO., Medina, O.**

## PATENTS.

Twenty-five Years' Practice.

**CHARLES J. WILLIAMSON,**

Second Nat'l Bank Bldg., Washington, D. C.

Patent practice in Patent Office and Courts.  
Patent Counsel of The A. I. Root Co.

## CLASSIFIED ADVERTISEMENTS

Notices will be inserted in these classified columns at 25 cents per line. Advertisements intended for this department can not be less than two lines, and should not exceed five lines, and you must say you want your advertisement in the classified columns or we will not be responsible for errors.

### Honey and Wax for Sale

**FOR SALE.**—To reduce stock I offer for sale as follows; 26 cases of stock No. 40, and 40 cases of stock No. 44 at \$10.80 per case of two 60-lb. (new) cans. This is a raspberry-basswood blend, and is the cream of two apiaries; being extracted from select all-sealed upper stories. A third of a century's experience in the production of fine extracted honey. Ask for my little circular "A Word about Extracted Honey;" this will explain why it pays to buy this delicious stock.

E. D. TOWNSEND, Remus, Mich.

**FOR SALE.**—150 cases of No. 1 comb honey, 15 sections in 3-inch glass, no-drip cases, 6 cases in a crate, very fine, at \$2.00 per case, f. o. b. cars here. Also 8000 lbs. clover and basswood extracted, in new 60-lb. cans, 2 in case, very heavy body and fine flavor, at 8c, f. o. b. cars here. Sample free. Also extracted in 1-lb. Simplex jars, at \$2.00 per dozen.

W. H. TOWNSEND, Hubbardston, Mich.

**LISTEN!**—The two cases of honey are received, and I am greatly pleased with it. I don't think I ever saw finer honey in my life.

E. W. PEIRCE, Zanesville, Ohio.

You will be just as well pleased with your honey as Mr. Peirce. If you send your order to JAY SMITH, of North Adams, Mich. One 60-lb. can, 8½ cts.; two 60-lb. cans, 8½ cts. For larger orders write for prices. Sample free.

**FOR SALE.**—My new crop of white-clover extracted honey. Honey has been left in full charge of the bees for three weeks after harvest, and is rich, waxy, and of fine flavor, and is as good as a specialist can produce. Price is 8c. per lb. by the case of 120 lbs. or for the entire crop. Cash to accompany order.

LEONARD S. GRIGGS, 711 Avon St., Flint, Mich.

**FOR SALE.**—Clover and basswood extracted honey in new 60-lb. cans, two in case, at 7 cts.; in second-hand cans, ¼ cent less. Also light amber fall honey from heartsease and aster, at ½ ct. less the above prices if 10 cases or more are taken. Also Fancy and No. 1 comb.

PETER J. NORBERG,  
Spring Valley, Ill.

**FOR SALE.**—2000 lbs. of fancy extracted honey—clover and a little basswood mixed; thoroughly ripened on the hives; is thick, rich, and delicate in flavor. Put up in new 60-lb. cans; 2 in a case, cases iron-bound. Price, 9 cents per lb. Sample 10 cts.

JOS. HENKE, Port Washington, Wis.

**FOR SALE.**—Comb honey, amber, buckwheat, and No. 2 white, at \$2.75 per case of 24 sections; in 25-case lots, 5 per cent off; light amber extracted (three-fourths clover), in 60-lb. cans, two to case, at 8 cts.

QUIRIN-THE-QUEEN-BREEDER,  
Bellevue, Ohio.

**FOR SALE.**—Write for prices on clover, basswood, and buckwheat honey in 60-lb. cans and kegs; also comb honey and beeswax; all guaranteed to be pure.

W. L. COGGSHALL, Groton, N. Y.

**FOR SALE.**—Choice extracted honey for table use, gathered from clover and basswood—thick, well ripened, delicious flavor. Price 9 cts. per lb. in 60-lb. cans, two to case. Sample, 10 cts.

J. P. MOORE, Queen-breeder, Morgan, Ky.

**FOR SALE.**—I have some extracted honey, well-ripened, fine, clover and basswood, in new five-gallon round cans, at \$5.50 a can; sample free; delivered f. o. b. cars here; ought to suit anybody.

MATHILDE CANDLER, Cassville, Wis.

**FOR SALE.**—Choice extracted white-clover honey for table use, of fine flavor, thick, and well-ripened, in 60-lb. cans, at 9½ cts. per lb., F. O. B. Falmouth.

FRED C. FROST, Falmouth, Rt. 2, Ky.

**FOR SALE.**—Choice white-clover extracted honey. Ripened on the hives; extracted four to six weeks after it was gathered. Put up in new 60-lb. cans, or in any shape desired. Sample free.

J. F. MOORE, Tiffin, Ohio.

**FOR SALE.**—Fancy clover and also buckwheat extracted honey in new cans, two in a case. Send 10 cts. for sample, which may be deducted from first order. EARL RULISON, Rt. 1, Amsterdam, N. Y.

**FOR SALE.**—Honey, clover, or buckwheat, comb or extracted. Write for price. Sample of clover extracted free. State quantity and quality desired.

C. B. HOWARD, Romulus, N. Y.

**FOR SALE.**—Choice extracted honey, mostly clover and raspberry mixed; also light buckwheat. Price on application. Sample 10 cts.

JAMES MCNEILL, Hudson, N. Y.

**FOR SALE.**—8 tons of raspberry and basswood extracted honey, thick and very fine flavor, in new 60-lb. cans, 2 in case, at 7½ cts., f. o. b. cars here.

J. N. HARRIS, Mancelona, Mich.

**FOR SALE.**—2½ tons clover, also light amber; new crop, ripened on hives, new 60-lb. tins; 8½ to 10, f. o. b. Sample 10 cts.

E. L. PRATT, Queen-breeder, Swarthmore, Pa.

**FOR SALE.**—Well-ripened clover and buckwheat honey, in small or large packages; ask for sample and what you want.

D. H. COGGSHALL, Groton, N. Y.

**FOR SALE.**—Fine extracted honey, 25-lb. cans up to barrels.

JULIUS GENTZ, Shawano, Wis.

**FOR SALE.**—Fancy and No. 1 white-clover comb honey.

ANTON G. ANDERSON, Holden, Mo.

### Honey and Wax Wanted

Will pay 7c per lb. for gilt-edged white clover, raspberry, or basswood honey, in new 60-lb. cans f. o. b. here; and 12½, 11½, and 10½ cts. respectively for the first three grades of white clover separated honey. Chicago suburb.

B. WALKER, Clyde, Cook Co., Ill.

**WANTED.**—Comb, extracted honey, and beeswax. State price, kind, and quantity.

R. A. BURNETT, 199 South Water Street, Chicago, Ill.

**WANTED.**—25 tons of fancy comb honey. Write, stating particulars, to C. M. CHURCH, New Kensington, Pa.

### Wants and Exchanges

**SWAP.**—Scholarship I. C. S., transfer value \$65.00, for poultry, incubator brooders, or Shetland pony and rig, and pay difference.

GEORGE WANSEER, Cranford, N. J.

**WANTED.**—Refuse from wax-extractors and old comb for cash

ARCHIE COGGSHALL, Groton, N. Y.

**WANTED.**—Refuse from the wax-extractor, or slumgum. State quantity and price.

OREL L. HERSHISER,  
301 Huntington Ave., Buffalo, N. Y.

**WANTED.**—Bees in Southern California. Give price, location, and all particulars. Address

BEEMAN, 144 West Green St., Pasadena, Cal.

**WANTED.**—Bees. Spot cash prices. All letters answered

F. B. CAVANAGH, Springport, Mich.

### Help Wanted

**WANTED.**—Capable man 30 to 40 years of age, married, to take charge of small farm in Ohio. State experience, salary wanted, date could begin, and give names of references. Address

JOHN SMITH, Gleanings in Bee Culture, Medina, O.

**WANTED.**—Young man to learn the poultry business, one willing to work; not much work outside of the poultry part of it. Write at once.

HOUSE ROCK POULTRY FARM,  
East Weymouth, Mass.

### Situations Wanted

**WANTED.**—Position in South. Have farm and apiary experience. Florida preferred.

F. H. CRARY,  
Charles City, Iowa.

## Real Estate for Bee-keepers

**PECOS VALLEY** of New Mexico lands are coining \$50 to \$65 net per acre per year from alfalfa. Forty-five thousand acres of alfalfa in bloom five times a year, surrounding Artesia, means *honey* for the *bee-keeper*. Live in an ideal fruit country, where the largest artesian wells in the world constantly pour out their wealth. Artesia, the future Rose City, already has the famous "Mile of Roses." Homeseekers' excursions the first and third Tuesdays of each month. Agents wanted, to accompany parties. Write to-day to R. M. LOVE, General Agent, Artesia, N. M.

**FOR SALE.**—Delaware farm, public road; good buildings, good water; fruit, wood; rural delivery; school, churches, stores, mills, railroad depot, canneries, blacksmith shops, all convenient; an ideal place for bees, poultry, fruit, and trucking.  
L. A. LUDWIG, Marydel, Md.

**FOR SALE.**—Small homestead, first-class buildings, fully equipped apiary, in one of the most desirable locations to be found; will sell for less than the improvements can be replaced for. This was the home and the apiary of the late B. Taylor at Preston. Write for particulars. ALF. A. ZIEMER, Waltham, Minn.

**FOR SALE.**—California foothill ranch, San Diego Co., 160 acres, twenty-five in cultivation; house and barn; three acres orchard; 100 hives of bees; one span of horses; bee material and farming tools, \$1800.  
AUSTIN E. WHITE, Fallbrook, California.

**FOR SALE.**—Excellent location for apiary in the white-clover belt of Northern Wisconsin. Basswood, goldenrod, dandelion, and willow, abundant; 8½ acres, dwelling, telephone, R. F. D. Clear title. Price \$800, half cash, balance one and two years time on secured notes.  
ARNT ARNSEN,  
R. 5. Rice Lake, Barron Co., Wis.

**FOR SALE.**—Fine poultry and bee farm of twelve acres. Fine home, close to good town. No matter what you have looked at, investigate this. Address BOX 106, West Alexandria, Ohio.

**FOR SALE.**—Land in the Uvalde honey-belt, by the Asherton Land and Townsite Co., at \$15 to \$40 an acre.  
E. A. ARMSTRONG, Ag't, Carrizo Springs, Tex.

## For Sale

**FOR SALE.**—Tasmanian necklace shells, any quantity. Sample sent.  
G. H. SMITH, Ramsgate, Tasmania.

**FOR SALE.**—Sweet-clover seed, 15 cts. per pound, postage extra. Root's supplies. ANTON G. ANDERSON, Holden, Mo.

**FOR SALE.**—Blackwalnut timber. Twenty standing trees. Write BOX 51. R. & W. BINKERD, West Monterey, Pa.

**FOR SALE.**—Boiler and engine, 2 horse, \$60.00, in good working order.  
J. W. UTTER, Amity, Orange Co., N. Y.

**FOR SALE.**—Shipping-cases, the no-drip kind; overstocked; get our special prices.  
A. G. WOODMAN CO.,  
Grand Rapids, Mich.

**FOR SALE.**—A full line of bee-keepers' supplies; also Italian bees and honey a specialty. Melilotus (sweet clover) seed for sale at 8 cts. per lb. Write for catalog and particulars.  
W. P. SMITH, Penn, Miss.

**FOR SALE.**—About 1300 or 1400 cases, two five-gallon cans each, practically free from nail-holes, and were new tins when originally shipped to us. Make us an offer.  
CLEVELAND HEALTH FOOD CO., Cleveland, O.

## Poultry Offers

A. I. Root's Bee-goods, Poultry-supplies, Seeds, etc.  
STAPLER'S, 412-414 Ferry St., Pittsburgh, Pa.

**FOR SALE.**—Indian Runner ducks, great layers, cheaper than ever, \$2.00 each; \$3.50 per pair, \$5.00 per trio. Circular free.  
KENT JENNINGS, Mt. Gilead, Ohio.

## Bees and Queens

**FOR SALE.**—Bees, Carniolans and Italians, in new Danz. hives, very cheap.  
F. SAMPSON, Huntington, Mass.

**FOR SALE.**—First-class apiary of 150 colonies, fixtures and supplies; 45 are in Danz. hives; balance in Dovetailed. Good condition; no disease. Will sell very reasonable in lots to suit. For particulars write  
W. F. STUART, Ottawa, Kansas.

**FOR SALE.**—Italian bees and queens now ready. Untested, \$1.00; tested, \$1.50. Bee-keepers' supplies, Root's goods. Send for prices. Eggs from Silver-laced Wyandotte poultry.  
N. V. LONG, Biscoe, N. C.

**FOR SALE.**—Moore's strain and golden Italian queens, untested, \$1.00; six, \$4.00; twelve, \$7.00. Carniolan, Banat, and Caucasian queens, select, \$1.00; six, \$5.00. Tested, any kind, \$1.25; six, \$6.00. Choice breeding queens, \$3.00 each. Circular free.  
W. H. RAILS, Orange, Cal.

**FOR SALE.**—250 colonies of bees in ten-frame hives at \$2.75 per colony; no disease; fixtures for comb and extracted honey cheap; also 22 acres of land; first-class buildings, and improvements. If not sold by Jan. 1 a reliable man is wanted to rent or run bees and farm on shares.  
J. H. ZEINER, Bard, Ark.

## Bee-keepers' Directory

I no longer club a queen with GLEANINGS.  
W. T. CRAWFORD, Hinston, La.

Bee-keepers' Supply Co., Lincoln, Neb. We buy car lots of Root's goods. Save freight. Write.

No more queens for sale this fall.  
A. W. YATES, 3 Chapman St., Hartford, Ct.

Breeding queens of pure Caucasian and Carniolan races—price \$5.00. Order from A. E. Titoff, Expert in Apiculture, with Russian Department of Agriculture, Kieff, Russia. Remit with orders. Correspondence in English.

## SPECIAL NOTICES

BY OUR BUSINESS MANAGER

WANTED—SEED OF THE SIMPSON HONEY-PLANT, OR FIG-WORT.

We have just now sold out, and our new seed is hardly ripe; and, even if it were, we have not enough to go around. If any of the friends have any of the seed in stock, or can collect it for us, we shall be very glad to hear from them. Please mail us samples, tell us how much you have, and what you want for it.

WAX CRAFT.

The number of orders received for this book have been so large that we are obliged to report some little delay in mailing the same, and to beg the indulgence of our customers in this respect. We are rapidly catching up on orders, and trust this note will explain the delays in the receipt of the same. That the book is well thought of is shown by the large number of orders received for it. The price, as will be recalled, is \$1.00 postpaid.

HONEY-LABELS.

We have never enjoyed a larger trade in honey-labels than during the present season, and for the most part we have been able to fill all orders very promptly indeed, often getting them out within twenty-four hours from the time received here. On some labels for which we do not have many calls there has been rather more delay, for the low prices we make are possible only when several orders for the same label are printed at the same time. It is, therefore, our practice to accumulate several orders for the same label; and because of this the first orders in after one printing is done have to be held several days before another printing is made of the same order. This will explain to our label customers the little delays that sometimes ensue on certain label orders.

COLD-FRAME SASH.

As cold weather approaches, truck-gardeners are making plans for protection to the plants. We are prepared to furnish not only the regular cold-frame sash, 3 ft. 4 in. by 6 ft., but we also make special sash to order. The regular sash are usually shipped knocked down. Price 90 cts. each; 5, \$4.75; \$8.00 for 10. If put up, 10 cts. each extra, without paints; add 10 cts. for each coat of paint and \$1.00 for glazing, making the sash complete, with glass and two coats of paint, \$2.10 each. Our sash are made of cypress, 1½ inch thick, and as regularly furnished they are grooved for glass to be butted together. If preferred we also rabbet the bars so glass can be lapped and set in putty. Regular sash take four rows of 8x10 glass. We make on order other styles and sizes. Enquiries and orders solicited.

## Convention Notices.

BEE-KEEPERS' CONVENTION AT YORK, PA.

The Pennsylvania State Bee-keepers' Association will hold its annual convention at York, in the Court house, on Thursday and Friday, November 12 and 13. The program is not completed; but as it now stands it may be announced to begin at 1:30 P. M., Thursday, with an evening session; and two sessions Friday forenoon and afternoon. Dr. E. F. Phillips will speak on one or both of the following subjects: A general discussion of apiculture

in the United States, and the treatment of bee diseases. Professor Surface will speak on hay and honey-plants. Mr. E. R. Root will be present, and will probably speak on some phase of bee-keeping.

A. F. SATTERTHWAIT, Sec.

PANHANDLE BEE-KEEPERS' CONVENTION.

The Panhandle Bee-keepers' Association will meet in Knights of the Golden Eagle Hall, corner 38th Street and Jacob Street, Wheeling, West Virginia, on Monday, Nov. 16.

W. L. KINSLEY, Sec.

## Special Notices by A. I. Root

THE "CHURNLESS-BUTTER PROCESS."

We are pained to see in the *Farm and Ranch* and several other agricultural papers a full-page advertisement of a secret process of making butter in one minute without a churn or any other machinery. The operation is so easy that any child can work it. Butter of the highest grade is made in this way, and with no hard work. Family rights are sold at \$5.00; but the periodicals giving place to the advertisement usually offer to send their journals for several years for a much smaller sum than the \$5.00, and "fing in" the "\$5.00 secret." At the present writing I am not able to give our readers the inside of the wonderful process, but we hope to do so soon. The whole get-up has the earmarks of the seedless apple and the Miracle wheat. If I am making a mistake I will gladly apologize to the "Churnless Process Butter Company."

Some time ago the *Rural New-Yorker* published what is probably the above secret, and the editor tells me in a private letter that the great discovery is "older than some of the hills" at any rate. Friend Collingwood adds the following:

*Dear Mr. Root.*—I regard it as a great shame that some of our agricultural papers should act as they do about these humbugs. I noticed something first in the *Texas Farm and Ranch*, and then in a Chicago paper, *The Farmer's Voice*.

I sometimes wonder how it is that these humbugs and frauds are able to prosper as they do. Not a day passes that I do not hear of some new one that is being launched upon the market or else is being trained for the race.

New York, Oct. 2.

H. W. COLLINGWOOD.

NAVIGATING THE AIR.

Since my remarks in the last issue, Mr. Wilbur Wright has not only carried a bag of sand, but he has carried several passengers, and one of them a lady. Yes, Queen Marguerite, of Italy, has witnessed his flight, and had quite a talk with Mr. Wright. And now the papers tell us she is begging to take a trip with him in his machine; but the people protest, and I believe my good friend Wilbur objects—at least I hope so. God forbid that President Roosevelt or any other important personage should take any unnecessary risk at this stage of the proceedings. I admire the courage and bravery of both our President and Queen Marguerite; but I do not think they really have the right to risk their lives unnecessarily. What I mean is, that many good innocent people might suffer if these dignitaries were removed from their important duties by sudden accident. Our good friend Wilbur has also succeeded in remaining up in the air over an hour with a passenger, and we are told he has been granted the \$100,000. It rejoices my heart to hear of this complete success; for these two young men have worked hard and faithfully for many years. They have been so careful at every stage of proceedings, that, even after having made hundreds of flights, no accident occurred until the fatal one of September 17. And, by the way, I am told that Orville's broken bone is knitting nicely, and that it will probably very soon be as good as ever. It has been suggested in the papers that Wilbur might undertake to cross the English Channel. With favorable wind he could make the trip in about forty minutes. But I want to protest again against any unnecessary risks. While sailing over land, if any accident happens the machine can glide down and probably be managed so it will alight in a favorable spot. Before making voyages across the water, a boat (or several of them) should be provided, and a series of experiments made, with plenty of help at hand, in dropping into the water and starting up again out of it. When they can do this we are ready to cross the channel, and, may be some time in the future, cross the great ocean. I have made mention of President Roosevelt and the queen of Italy; but would it be extravagant to say that *Wilbur Wright* just now is worth more to the world than any president, king, or queen? May God help both of these to continue to exercise the care and caution they have been showing since they commenced their work.

We find a notice in the *Woman's National Daily* to the effect that Wilbur made a short trip with half a dozen passengers. I think this must be a misprint or a mistake in some way; for their present equipment could not possibly carry more than two people besides the operator, and these two people would have to be very light.

# BOOKS FOR BEE-KEEPERS

## The Swarthmore Library.

A series of booklets on bee subjects by E. L. Pratt, of Pennsylvania, known to the bee-keeping world as "Swarthmore." These books are full of the most valuable information. The Swarthmore method of queen-rearing is spoken of as the most important innovation in bee-keeping of recent years:

**INCREASE.** The first of the series. Any one desiring to enlarge his apiary should learn the Swarthmore way. Price, postpaid, 25 cts. French edition, entitled "Accroissement," 50 cts. postpaid.

**BABY NUCLEI.** The using of little frames and a handful of bees for mating queens has created quite a stir in the queen-rearing business. From this booklet you get your information direct. Price, postpaid, 25 cts. French edition, entitled "Nuclei Miniatres," 50 cts. postpaid.

**COMMERCIAL QUEEN-REARING.** A complete description of the Swarthmore methods of queen-rearing in regard to cell-getting. Price, postpaid, 25 cts.

**FORCING THE BREEDING-QUEEN TO LAY IN CELL-CUPS.** This little book rounds off the Swarthmore system. It is the finishing touch, and ought to be read by all queen-breeders. Price 25 cts.

**SIMPLIFIED QUEEN-REARING.** Revised edition. It tells the honey-producer how to rear queens by the very simplest method ever published. Good queens for little money and little trouble, in just an effective and economical plan for the bee-keeper who works for profit. Price 25 cts., postpaid.

## Bee-keepers' Ten-cent Library.

The following books are neatly bound in attractive papers, well illustrated. Just the thing for the beginners to help them with their troubles. Price ten cents each postpaid.

No. 1. **BEE-KEEPERS' DICTIONARY.** It is often confusing to a beginner or one who is not acquainted with the literature of bee-keeping to understand the different terms used by writers on the subject. This book is intended as a reference work giving clear definitions of current terms.

No. 2. **INMATES OF THE HIVE.** We often hear, even at this late date, about the "King Bee." This book is intended to correct such erroneous ideas.

No. 3. **HONEY-COMB.** This is a little book showing the construction and development of the honey-comb, and is alike useful and interesting.

No. 4. **HANDLING BEES.** Valuable especially for the inexperienced.

No. 5. **TRANSFERRING BEES.** This book details the most practical present methods of transferring from boxes to modern hives.

No. 6. **BUILDING UP COLONIES.** Plain instructions for getting colonies into the best condition for the honey-flow.

No. 7. **THE HONEY-FLOW.**

No. 8. **SWARMING.**

No. 11. **WINTERING BEES.**

No. 12. **SPRING MANAGEMENT OF BEES.**

No. 13. **BEE DISEASES.** There has long been need of a better book on this subject. The book is written by Mr. E. R. Root, after long comparison and careful study of the writings of leading bee-keepers on the subject.

No. 15. **ESTABLISHING AN APIARY.**

No. 16. **MODERN QUEEN-REARING.** Detailing the latest methods, by leading breeders, embracing the best of several systems. We have also a French edition entitled "Elevage Moderne de Reines," and a Scandinavian edition entitled "Moderne Dronning-avl," 25 cents each.

No. 17. **HABITS OF THE HONEY-BEE.** A condensed account of the life and habits of the bee in simple language.

No. 18. **BEE-KEEPING FOR CLERGYMEN.**

No. 19. **BEE-KEEPING FOR WOMEN.**

No. 21. **FACTS ABOUT BEES.** Just what it's name indicates.

No. 23. **'BEE-KEEPING IN JAMAICA.**

No. 24. **BEE-KEEPING IN THE WEST INDIES.** A practical book written for the English Department of Agriculture, by W. K. Morrison, valuable for all tropical countries.

No. 25. **HOW TO PRODUCE EXTRACTED HONEY.**

No. 26. **THE DZIERZON THEORY.**

No. 27. **DOVETAILED HIVE AND ITS USES.**

No. 28. **DIVISIBLE-BROOD-CHAMBER HIVE.**  
No. 29. **MOVING AND SHIPPING BEES.**  
No. 30. **THE BEE-KEEPER AND THE FRUIT-GROWER.**

## Popular Works on Bee Culture.

The list of books below are for the most part by writers of well-known literary ability, and are very interesting indeed, and are greatly valued by bee-keepers and others for their literary merit, and the popular style in which bee-keeping is depicted and we are very glad to have the opportunity to offer them to bee-keepers and others. The description of each work will give a fair idea of the same, but a pamphlet giving an extended view of these and the practical books on bee culture listed in the preceding columns will be sent on application.

**THE HONEY-MAKERS.** By Miss Margaret W. Morley. This is the story of the life of the bee, told in very interesting style—how it lives, gathers honey, and all about it. While clothing the general subject with an air of poetry, it seems to be entirely within the limits of known facts while attempting to deal with them. We believe it will give all thoughtful bee-keepers a greater liking for their business to read it. Probably it has more to do with the curious traditions connected with bees than any other book of the kind. Price \$1.50 postpaid; by freight or express, 10 cents less.

**THE LIFE OF THE BEE.** By Maeterlinck. This is a masterpiece of fine writing by a modern Shakespeare. The words fly from the pen of this writer like sparks from a blacksmith's anvil, the result being a glorification of the honey-bee. Maeterlinck is considered by many to be the finest writer now living, and anything from him is sure to be worth reading. He is, to a certain extent, familiar with bee-keeping, but the truth about bees does not interest him so much as the romance of the queen and the drone and the swarming instinct. The book itself is well bound and beautifully printed. Cloth bound, 42 pages. Ed. 1903, price \$1.40 postpaid; by freight or express, 10 cts. less.

**THE BEE PEOPLE.** A book on bees, especially for children, from the pen of Margaret W. Morley. Including its elegant illustrations, it is, in some respects, the prettiest bee-book in existence. It has 177 pages, very coarse print, the reading being ingeniously interwoven with the illustrations showing the parts of the bee. The story of bee-life is told in a fascinating manner, and is well calculated to get the casual reader, as well as children, interested in this useful insect. The cuts go just enough into detail to explain fully the lesson taught, without confusing the mind with other things. We think the book well worthy a place in every bee-keeper's home. Fittingly designed cover. Price \$1.50 postpaid; by freight or express, deduct 10 cents.

**THE SWARM.** By Maurice Maeterlinck, author of the Life of the Bee. This is a book of 113 pages, prettily bound in cloth. Price \$1.20 postpaid; by freight or express, 10 cents less.

**THE BEE-MASTER OF WARRILOW.** Tickner Edwards. Cloth bound, 64 pages; 57 cents postpaid; by freight or express, 7 cents less.

## BEE MODELS—THE ANATOMY OF THE BEE.

There are a good many bee-keepers who will admit they ought to know more about the anatomy of the bee; but owing to the difficulties surrounding the subject they have thus far been unable to acquaint themselves in the least with the marvelous structure of the honey-bee. For such persons there has been constructed a *pasteboard* bee, showing all the internals of a queen and also a drone in a manner that leaves little to be desired. With the aid of the key, any intelligent person may soon become well acquainted with the anatomy of the bee and the proper name of each organ. First there is a life-like representation of the queen and drone (separately). By lifting the outer covering the breathing apparatus and digestive system are unfolded; lifting again there will be found the reproductive system and poison-glands; and by again lifting, the nervous system is clearly outlined. Every thing is as clear as daylight, as each part and organ is numbered, and the key which we send gives the correct scientific name of the same. Our models of the queen measure  $6\frac{1}{2}$  inches, while those of the drone are  $5\frac{1}{2}$  inches. We can furnish the two with a key for 75 c. postpaid; or either one at 50 c. postpaid.

- MEDINA, OHIO, U. S. A.

The A. I. ROOT COMPANY

# H O N E Y

We have on hand a fine lot of new extracted white-clover honey which is excellent, and which we offer at the following prices :

# Don't Buy a Stove or Range Until You First See How Much You Save By Getting

## "A Kalamazoo Direct to You"

TRADE MARK REGISTERED

**YOU** want to make every cent you spend this year, **count for quality and economy.**

If you need a stove or range, don't buy until you get our **factory** prices. I promise you that I will save you \$5, \$6 or \$10 on our smallest stoves, and as high as \$18, \$20 and even \$30 on our largest. And I promise you that you cannot get **anywhere** at any price, a better stove or range than the Kalamazoo.

Just let me quote you prices. Take our catalogue and **compare** the Kalamazoo **quality and prices**, with the best line of stoves and ranges you can find sold at retail. That will tell the story. You can see for yourself. You want to save money and you want to get high quality. Why not investigate our plan, then? Why not let me show you the difference between manufacturers' prices and retail prices on stoves or ranges?

We sell to you, direct from the factory, at actual factory prices,

### On 360 Days Approval Test—We Pay the Freight

I promise, in black and white, to refund your money—every cent of it—if you do not find your purchase in every way exactly as represented.

Remember, every Kalamazoo is of the highest possible grade, made of the best materials and in the best manner. You deal directly with the manufacturers—a company that has a larger number of individual customers than any other stove company in existence. We have sold thousands of stoves and ranges to readers of this journal, and no doubt can refer you to near neighbors who have saved money by buying a Kalamazoo. Many customers write that they have saved enough on a single Kalamazoo to pay for a whole season's fuel. You can save enough to buy a new suit, a new dress, an article of furniture, or perhaps to pay your taxes. Is it not to your interest to get our prices!

### Send Postal for Catalogue No. 416

describing more than 300 sizes and styles of Coal and Wood Ranges, Coal and Wood Heaters, Hotel Ranges, Base Burners, Laundry Stoves, Etc.

I know that if you get our prices—and see our quality you will not even think of buying any other make. Let me show you how much you can save.

# 17 Cents a Day Buys an Oliver

This amazing offer—the New Model Oliver Typewriter No. 5 at 17 cents a day—is open to everybody, everywhere.

It's our new and immensely popular plan of selling Oliver Typewriters on little easy payments. The abandonment of long-hand in favor of clean, legible, beautiful *typewriting* is the next great step in human progress.

Already—in all lines of business and in all professions the use of *pen and ink* is largely restricted to the writing of *signatures*.

Business Colleges and High Schools, watchful of the trend of public sentiment, are training a vast army of young people in the use of Oliver Typewriters.

The prompt and generous response of the Oliver Typewriter Company to the world-wide demand for *universal typewriting*, gives tremendous impetus to the movement.

The Oliver, with the largest sale of any typewriter in existence, was the logical machine to take the initiative in bringing about the *universal use* of typewriters. It *always* leads!

SAVE YOUR PENNIES AND OWN  
The

## OLIVER Typewriter

THE STANDARD VISIBLE WRITER

This "17-Cents-a-Day" selling plan makes the Oliver as easy to own as to rent. It places the machine within easy reach of every home—every individual. A man's "cigar money"—a woman's "pin money"—will buy it.

Clerks on small salaries can now afford to own Olivers. By utilizing spare moments for practice they may fit themselves for more important positions.

School boys and school girls can buy Olivers by saving their pennies.

You can buy an Oliver on this plan at the regular catalog price—\$100. A small first payment brings the machine. Then you save 17 cents a day and pay monthly.

And the possession of an Oliver Typewriter enables you to *earn money to finish paying for the machine*.

### Advantages

The Oliver is the most highly perfected typewriter on the market—hence its 100 per cent efficiency.

Among its scores of conveniences are:

- the Balance Shift
- the Ruling Device
- the Double Release
- the Locomotive Base
- the Automatic Spacer
- the Automatic Tabulator
- the Disappearing Indicator
- the Adjustable Paper Fingers
- the Scientific Condensed Keyboard

Can you spend 17 Cents a day to better advantage than in the purchase of this wonderful machine?

Write for Special Easy-payment Proposition or see the nearest Oliver Agent.

**The Oliver Typewriter Co.**  
103 Dearborn St. Chicago.

### Service Possibilities

The Oliver Typewriter turns out more work—of better quality and greater variety—than any other writing machine. Simplicity, strength, ease of operation and visibility are the corner stones of its towering supremacy in

- Correspondence
- Card Index Work
- Tabulated Reports
- Follow-up Systems
- Manifolding Service
- Addressing Envelopes
- Working on Ruled Forms
- Cutting Mimeograph Stencils

## Why Do You Remain

in a section where the climatic conditions are so against you, where it is necessary to battle with the rigors of a long winter?

## Wouldn't You Like

to be permitted to carry on work out-of-doors throughout the entire year? A location in our southern territory offers many opportunities and advantages, and makes life a pleasure the year round. The lands can be obtained at reasonable prices, they are equally as productive as yours, prices as good, if not better, for your crops, and no long winters of ice and snow to contend with.

## The Seaboard Air Line Railway

through its Industrial Department, is anxious to assist you in bettering your present condition. Literature will be sent free upon request. Ask for copy of "FRUIT AND VEGETABLE GROWING" in the Land of Manatee, written by a western man, containing descriptive data, profits derived from various crops, etc.

## Special Rates

November 24th

The lowest rate ever offered for the benefit of prospectors and homeseekers will be in effect from certain points on Nov. 24th. Let us help you take advantage of this opportunity to make a trip of investigation at very little cost. Write for full particulars.

**OUR  
GRAND 1908  
OFFER**

**NEW  
LUMBER**

**[FIFTY MILLION FEET  
AT REDUCED  
PRICES]**

Bought at Forced Sales from Manufacturers. It makes  
us Headquarters for Thousands of Genuine Bargains  
in Lumber and Building Supplies. We save you money.

**BIG  
SPECIAL  
SALE**

**SAVE 30 TO 60 PER CENT. BUY DIRECT. BUILDING SUPPLIES OF EVERY KIND**

The Chicago House Wrecking Co. Purchased at forced sales, 50,000,000 feet of new lumber. We are making special concessions to those who buy at once. Our prices today are far lower than prices have been for years. Order now for immediate or future use. Quick action will save you big profits. Remember prices elsewhere which are even now high, are bound to rise. We can quote you 30 to 60 per cent better prices for the same lumber than your local dealer. We guarantee every carload to be exactly as represented. Closest inspection of our lumber stock invited.

Call at our warehouse and yards at Chicago and see the lumber we are offering and you will recognize that it is all we say of it. Make your own selection and see it loaded. It is not necessary to come to Chicago, however, unless you wish to. **We can fill your order by mail with just what you want and guarantee you absolute satisfaction.** Ours is the largest direct to the

consumer lumber headquarters in the world. We sell millions of feet annually. Orders filled from every part of the United States. No matter where you live you can save money by supplying your building wants here.

We do not figure fancy prices, but quote figures that command your patronage. Whether your order is large or small we can save you money on it. Our tremendous business of millions of dollars annually is your best guarantee of complete satisfaction of every purchase made from us. In our enormous stock of new lumber of every kind we have just what you need for every purpose. Don't buy a stick of material until you get our prices. We offer you everything in the lumber and building supply line needed for residences, farm homes, stores, churches, barns, outbuildings of every kind, sidewalks and fencing. In short any kind of a structure requiring lumber, at from 30 to 60 per cent less than your local dealers or lumber yards ask for it.

**IMPORTANT! Send Us Your Lumber Bill For Our Estimate**

Make up a list of what you need. Send it to us for our price. If you are putting up a building of any kind whatsoever let us figure with you. **Our prices talk louder than words.** Have your carpenter or contractor send us your list of what is needed if he has charge of your building. Don't pay exorbitant prices to the lumber trust with their long line of lumber yards all over the country. Don't let the local dealer soak you with his heavy profit. Remember Chicago House Wrecking Company buys millions of feet at a time under circumstances of forced sales which means sacrificed prices and enables us to sell even as low as cost without loss. You take no chances in dealing with the Chicago House Wrecking Company. Whether for \$1 or \$10,000 your order will be filled carefully. Our lumber and supplies are guaranteed exactly as represented. If you have no need for a whole carload yourself get your neighbors to club in with you. By buying a carload you can save all kinds of money on freight charges.

We have railroad trains running through our main warehouses and buildings and can load a car to good advantage to you. You can include in this same car, pipe, plumbing material, roofing, wire, fencing, furniture, hardware and merchandise of every kind.

We also furnish you building and barn plans absolutely free upon request. Write us for any information or advice you want and we will have our staff of architects answer every inquiry promptly. Our free book of plans is sent if you mention this paper. We simplify your building proposition.

Our business demands quick action. We must keep our stocks moving. This means prompt shipment—no annoying delays. Let us help you lay out your plans. We will relieve you of every detail. That is what our Special Builder Service is for. Be sure and send us your lumber bill for our estimate. Feel free to write for anything you want to know along the line of building supplies, furnishings, etc.

**WE PURCHASE

## Honey Markets.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent), cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

### EASTERN GRADING-RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**A No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

### NEW COMB-HONEY GRADING-RULES ADOPTED BY THE COLORADO STATE BEE-KEEPERS' ASSOCIATION.

**No. 1 WHITE.**—Sections to be well filled and evenly capped except the outside row, next to the wood; honey white or slightly amber, comb and cappings white, and not projecting beyond the wood; wood to be well cleaned; cases of separated honey to average 21 pounds net per case of 24 sections, no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 1 LIGHT AMBER.**—Sections to be well filled and evenly capped, except the outside row, next to the wood; honey white or light amber; comb and cappings from white to off color, but not dark; comb not projecting beyond the wood; wood to be well cleaned.

Cases of separated honey to average 21 pounds net per case of 24 sections; no section in this grade to weigh less than 13½ ounces.

Cases of half-separated honey to average not less than 22 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 23 pounds net per case of 24 sections.

**No. 2.**—This includes all white honey, and amber honey not included in the above grades; sections to be fairly well filled and capped, no more than 25 uncapped cells, exclusive of outside row, permitted in this grade; wood to be well cleaned, no section in this grade to weigh less than 12 ounces.

Cases of separated honey to average not less than 19 pounds net.

Cases of half-separated honey to average not less than 20 pounds net per case of 24 sections.

Cases of unseparated honey to average not less than 21 pounds net per case of 24 sections.

**INDIANAPOLIS.**—While prices are not high, the demand for honey has never been better—a fact that can be attributed to the quality of goods now on our market. This is a white-clover district, and our market is almost free from honey from other sources. Producers are offering fancy white comb at 12½; No. 1 white, 12; white clover, extracted, in five-gallon cans, 7. Some amber honey is being offered, but the demand is not sufficient to establish a price. Beeswax is steady at 28 cts. cash, or 30 cts in exchange for merchandise.

Oct. 18.

WALTER S. POWDER, Indianapolis.

**BOSTON.**—White fancy comb honey, 16 to 17; No 1 ditto, 14 to 15; No. 2 ditto, 12 to 13; extracted clover, white, 10 to 11; extracted light amber, 8 to 9; extracted amber, 7; fancy to choice extracted honey in barrels, 6 to 7.

Oct. 18.

BLAKE-LEE CO.,  
4 Chatham Row, Boston, Mass.
